A. Yes, quite decidedly. I was thinking perhaps I didn't answer the previous question fully. I have done considerable work in zinc in Tennessee, and the usefulness of my work in Tennessee was based to no small extent on my knowledge that has been gained through many years of the study of similar ores in Virginia. As a matter of fact, I did considerable work for one client in the Ivanhoe region.

2219 Q. Dr. Holden, what, in general, were the mineral resources of the valley of New River?

A. Iron ore in various forms, lead and zinc, some sulphide iron ores that have been used in the manufacture of sulphuric acid at Pulaski, some coal resources, and various other things.

Q. How did the iron ore deposits of Southwestern Virginia compare with other known deposits of such ore in Virginia, say prior to 1888—what was the relative magnitude so far as they were known prior to 1888, compared to known iron ore elsewhere in Virginia?

A. They were conspicuous. They were deposits of a character that were readily seen and they had attracted attention from the earliest time.

Q. Were they larger or smaller than other known deposits at that time in Virginia?

A. I think they were considered larger.

Q. You have stated you have made a study of the iron, lead and zinc industries of Southwestern Virginia. Will you please state something of the sources which you examined and studied in the course of your study of these industries in that area?

A. You mean from a historical standpoint?

Q. Yes.

A. I studied everything I could find.

Q. Will you just give the Court some idea what those historical sources were?

A. The one that interested me most was perhaps Iron Manufacturers' Guide, written by J. P. Leslie, and published in 1858; another one was Iron in all Ages, by J. M. Swank, and published about 1892; another one was the Bishop history of American Manufacturers; another was various items in the Transactions of the American Institute of Mining Engineers; the records of production of the U. S. Geological Survey, as published in Mineral Resources; a private report on the history of the zinc mines at Austinville; Bulletin #43 of the Virginia Geological Survey; publication known as the Mineral Resources of Virginia; C. R. Boyd's Mineral Resources of Southwest Virginia; reprint 2220 of the annual reports of the State Geologist, W. B. Rogers; publication prepared for the Norfolk & Western Railway by McCreath and D-Invilliers.

By Mr. Thompson:

Q. Is that a publication in the libraries so one can get it?

A. Generally. [Continuing.] On account of my interest in the historical side of this matter I interviewed all of the men who are engaged in the industry, at an early date, particularly the older men. I have talked with Mr. D'Invilliers, perhaps the most interesting was John W. Robinson and C. S. Lucas of the Pulaski Iron Company, Mine Superintendent, and Mr. A. J. Dull, President of the Pulaski Iron Company.

Q. Mr. Holden, when did you commence your research into these histories in Southwest Virginia?

A. Do you mean before or after I came here?

Q. Or at whatever time it was.

A. I began several years before I came here.

Q. Did you continue after you came here?

A. On every occasion and from every source.

Q. You have referred to a number of written documents and reports as among sources you have examined in the course of your studies. Will you please state whether those documents are generally accepted by students of the history of those industries in this area as reliable or trustworthy?

A. These reports are considered authoritative. In history we must draw from all available sources and as historians we must judge as to the relative value of the things. I consider all of these things I have cited as important and reliable.

Q. Doctor, prior to the time in 1886 when the Cripple Creek Division of the Norfolk & Western Railway Company was put in operation from Pulaski up as far as Foster Falls, what, if any, iron, lead or zinc industries were located on or near New River above Radford?

A. I am not familiar with all the zinc operations. The chief zinc operation was the mine now operated at Austinsville. There were a couple of other operations, one of which I think is called the Bertha Mine and was operated as a zinc mine for some
2221 years before I came to this country. At that time when I first visited the region it was being operated as an iron mine and some zinc recovered as a side issue. There were a considerable number of charcoal furnaces—did you say before 1888?

Q. Before 18—in and prior to 1886, when the Cripple Creek Division of the Norfolk & Western was built from Pulaski to Foster Falls?

A. I must answer that from the records, because I was not there at that time, but there are abundant records to show that there were many charcoal furnaces operated in that region.

By Mr. **Jackson**. I produce a map which bears the legend in the upper left-hand corner "Geological Map of the New River, Cripple Creek Region, showing the approximate location of ore openings and properties tributary to the Cripple Creek Extension of the Norfolk & Western Railroad, by E. V. D'Invilliers, Geologist, 1887," and ask to have it marked as Defendant's Exhibit 550, for identification.

(Same is here marked for identification as requested.)

By Mr. **Jackson**:

Q. Dr. Holden, I show you defendant's Exhibit 550 for identification, and ask you what it is?

A. This is a map which accompanied the report of McCreath and D'Invilliers, a report being made to the Norfolk & Western Railway Company.

Q. Does that map purport to show the location of iron, lead and zinc mines and of iron furnaces and lead and zinc industries in that area?

A. It does.

Q. Doctor, please state what reputation this map bears among tudents of the iron, lead, and zinc industries of southwestern Virginia as to accuracy of the locations of the various mines and urnaces shown thereon?

A. The map is generally accepted by students of iron, lead, and inc industries of southwestern Virginia as correctly showing he locations of the iron and zinc industries in that region. My wn study confirms the general acceptance—the general correctess of this map.

Q. That is in that respect?

A. In that respect. As a matter of fact, it was the chief guide hat I had when I started to study this region and I was quite ritical in regard to it, but I was unable to find anything essenially incorrect on it.

(Exhibit 550 introduced in evidence and subsequently phototatic copy thereof was substituted for said exhibit.)

Q. Dr. Holden, when were the charcoal and iron furnaces esablished which are shown on Defendant's Exhibit 550 as having een situated on or within easy access to New River?

All the furnaces mentioned in the category are not shown on that map.

222 Q. Will you state the date of the establishment of the early charcoal-iron furnaces with which you have become amiliar during your study of this subject?

A. I have here a list of such furnaces, together with the date f building, the date of rebuilding, and as a matter of conveniece, I will hand this to the reporter.

Q. Will you read it so it can be heard and then you can give t to the reporter for copying, so it will be easier for the reorter.

By Mr. **Thompson**:

Q. Are there many of them?

A. A dozen or so. I have not an extra copy here, but I can urnish one.

By Mr. **Jackson**:

Q. Will you read that, doctor?

A. The first column is name of the furnace, the second olumn is the name and building date and the third column is the late of rebuilding:

TABLE A

(List of certain Charcoal Blast Furnaces of the New River Region of Southwest Virginia with dates of Construction)

	Original building date	Rebuilt
Poplar Camp	1788	
Cedar Run (Parry Mount No. 1)	1800	
Raven Cliff	1810	1876
Brown Hill (Wilkenson's)	1810	1870–4, 1882
Little Wythe	1819	1876
Cedar Run (Parry Mount No. 2 or Graham's)	1832	
Barren Springs (Graham's New)	1853	1873
Eagle (Gray Eagle)	1864	1881
Radford (Macks Creek)	1868	
Walton	1872	1882
Speedwell	1873–4	
White Rock (Panic)	1875	
Beverly	1880	
Irondale (Norma or Noble)	1881	
2223 New River (Foster Falls or Pierce)	1881	
Reed Island (Boom)	1881	
Cave Hill	1881	
Ivanhoe	1881–2	
Sinking Creek	1873	

Q. Dr. Holden, will you state the capacity of these charcoal pig-iron furnaces for which reliable data are available?

A. I have that written out on a sheet, and I will read it: "Raven Cliff furnace had a daily capacity of ten tons. Brown Hill and Walton Furnaces an annual capacity of 8,500 tons——"

Q. That is for both of them?

A. I understand that that is the combined production capacity of both furnaces, and so given because they were owned by one concern.

By Mr. THOMPSON:

Q. May I ask where you got those figures from? You say you understand that the combined capacity there—where did you get these figures from?

A. Mostly from various sources, partly from an Iron Manufacturers Guide, partly from the Virginias.

Q. Virginias what?

A. Virginias is the name of a magazine which was published from 1880 to 1885, by Jed Hotchkiss, at Staunton, Virginia. Also these capacities were taken from the bulletins of the American Iron and Steel Association. In case of discrepancies I have used the information which seemed to be the most correct. In addition to this, I can say that I have seen most of these furnaces personally and am able to judge something from my own observation.

By Mr. JACKSON:

Q. Will you proceed with your reading?

A. "Wythe Furnace an annual capacity of 1,500 tons. Cedar Run (No. 2) an estimated annual capacity of 2,000 tons. Eagle, an annual capacity of 600 tons. Radford furnace an estimated annual capacity of 4,000 tons. White Rock, a daily capacity of 8 tons. Beverly, Eagle, Raven Cliff and Speedwell, an 2224 annual capacity of 7,500 tons. Irondale, an estimated annual capacity of 3,000 tons (daily capacity 15 tons). New River, an annual capacity of 2,000 tons. Reed Island, an annual capacity of 2,000 tons. Cave Hill, an estimated annual capacity of 2,500 tons. Ivanhoe, an annual capacity of 8,000 tons. The foregoing tonnages are based upon the short ton figure of 2,000 lbs. to the ton."

Q. Dr. Holden, what was the annual production in 1880 of these charcoal iron furnaces for which production figures are available?

A. I have here a table which I have prepared, giving such production.

Q. Production for 1880?

A. For 1880.

Q. Will you read it, please?

A. This is also in tons of 2,000 lbs. "Radford, 930 tons." Boom was then in process of building——

By Mr. THOMPSON:

Q. Where did you get your items for the Radford furnace of 930 tons?

A. From the Virginias, Volume 2, page 29, for the year 1881, Volume 2, page 29.

Q. May I ask what the Virginias is?

A. The Virginias is a magazine which was published monthly throughout the years 1880 to 1885. It is a standard source of information along lines of natural resources for those dates.

Q. Well, who is the authority for the publication?

A. I gave that previously—Jed Hotchkiss.

Q. Who is he?

A. I was not personally acquainted with Mr. Hotchkiss, but he was a man of considerable geological training and deeply interested in mineral resources.

Q. Was he a man of outstanding figure in the geological world?

A. He was an outstanding figure in Virginia at that time, he was preeminent.

By Mr. JACKSON:

2225 Q. Was Mr. Hotchkiss an engineer for a division, or part of the army commanded by Stonewall Jackson, do you know?

A. I am not quite sure, but I think he held some such position.

Q. Was he a man of any reputation for veracity or probity?

By Mr. THOMPSON. If Your Honor please he might have a reputation for veracity——

By the COURT. If you will permit an interjection by the Court here, he was a very notable figure following the Civil War and some years thereafter. He was an engineer and geologist and very much interested in mineral resources in the State of Virginia and in a general engineering and mining development—not only a geologist of considerable note but also an engineer, and he published this magazine to which reference has been made, for the purpose of furnishing information and giving data and arousing interest in the mineral resources of Virginia and to keep people informed about them. He was a very prominent figure in the State for many years. I know that was his history and status in the history of Virginia.

By Mr. JACKSON:

Q. This magazine, the Virginias, what was its reputation among students in this field, as to reliability and trustworthiness?

A. I have considered it a chief source of historical information for these things that I am particularly interested in and I have never heard any question of essential facts raised.

Q. Will you proceed?

A. What was the question?

Q. The question is, I ask you to read into the record the table which you had prepared showing the production for 1880, of such of these charcoal-iron furnaces as there is reliable data for?

A. I had started on that—I will begin at the beginning: "Radford, 930 tons; Boom, Building; Barren Springs, 1,500 (about); Cedar Run, 1,000; Pierce, Building; Walton, 350–400; Brown Hill, 1,000; Raven Cliff, 1,500; Beverly, 650; Wythe, 1,650; Speedwell, 750."

Q. Doctor Holden, have you prepared a table of the annual production in 1881 of these charcoal-iron furnaces for which production figures are available?

A. I have.

Q. And were those figures obtained from the same sources as production figures for 1880?

A. They were obtained from the Virginias, Volume 3, page 52, for the year 1882.

2226 By Mr. THOMPSON. You are referring now to this Table B-1 that we have?

By Mr. JACKSON. No, it is the table the doctor has marked "C."

A. I have previously given you the reference to B-1.

Q. Now if you will please read——

A. Again in tons of 2,000 lbs.: "Beverly Furnace, 950 tons; Cedar Run, 1,250; Eagle, 600; Irondale, 700; New River, 980; Raven Cliff, 1,500; Reed Island (Boom), 1,125; Speedwell, 600; Walton, 800; White Rock, 725; Wythe, 850."

Q. Dr. Holden, have you prepared a table showing the annual production in 1882 of the Charcoal Iron furnaces for which production figures are available?

A. I have.

Q. And did you obtain that information from substantially the same sources as the information for 1881?

A. From Virginias, Volume 4, page 5, for 1883.

Q. Will you read that?

A. Again in tons of 2,000 lbs.: "Barren Springs, 500 tons; Beverly, 1,600; Brown Hill, 1,000; Cave Hill, 450; Cedar
2227 Run, 900; Eagle, 350; Irondale, 1,200; Ivanhoe, 2,100; New River, 2,100; Macks Creek (Radford), 950; Raven Cliff, 1,500; Reed Island (Boom), 2,100; Speedwell, 1,200; Walton, 1,300; White Rock, 1,200; Wythe, 750."

Q. Dr. Holden, what was the total production of these charcoal iron furnaces for 1882?

A. About 20,000 tons.

Q. Are there production records showing separately the production of such charcoal iron furnaces for the period 1883 to 1886?

A. I have not been able to find any records stating separately the production of charcoal iron furnaces after these years.

Q. State if you know whether there was production from charcoal iron furnaces on or near New River, above Radford, prior to and subsequent to the years for which you have given production figures, that is, 1880, 1881 and 1882?

A. Will you repeat that please.

Q. Read him the question. [Question read.]

A. Yes, there was production both before and after those years.

Q. During the period prior to 1887, what proportion of the production of charcoal pig iron in Virginia was produced by the furnaces on and along upper New River?

A. During the period prior to 1887 most of the charcoal pig iron produced in Virginia came from the upper New River. For 1882 the charcoal iron produced in upper New River furnaces was approximately 19,200 tons. The total production of charcoal iron in Virginia for 1882 is reported as 26,133 tons. The furnaces along New River contributed about three-fourths of Virginia's production of charcoal iron in that year.

Q. Doctor, have you prepared a table showing the annual production of charcoal pig iron in Virginia for the period from 1872 to 1884 inclusive?

2228 A. I have.

Q. Will you read that into the record please.

A. "1872, 21,445 tons; 1873, 22,475; 1874, 23,451; 1875, 15,391; 1876, 7,350; 1877, 6,193; 1878, 6,333; 1879, 7,703; 1880, 14,043; 1881, 19,038; 1882, 26,133; 1883, 16,879; 1884, 14,829."

Q. Have you also prepared a table showing the annual production of pig iron in Virginia, both charcoal and coke for the period of 1872 to 1880, inclusive?

A. I have.

Q. Will you read that into the record please.

A. "1872, 21,445 tons; 1873, 26,475; 1874, 29,451, 1875, 29,985;
1876, 13,046; 1877, 12,434; 1878, 16,928; 1879, 18,873; 1880,
29,934; 1881, 83,711; 1882, 87,731; 1883, 152,907; 1884,
2229 157,843; 1885, 163,782; 1886, 156,250; 1887, 175,715; 1888,
197,598."

Q. Dr. Holden, your table on the charcoal pig iron production in Virginia 1872 to 1884, inclusive, were there any records later than 1884 showing the charcoal pig iron production separately?

A. I was able to find none.

Q. I think you have already testified as to the lead and zinc industries on or near New River, above Radford, in and prior to 1886, have you not?

A. As to the history?

Q. No; as to whether there were any or not?

A. Iron and zinc?

Q. No; lead and zinc.

A. I don't remember.

Q. Well, were there any before 1886 on New River above Radford?

A. Yes, sir.

Q. Give very briefly what they were?

A. The mining and smelting of lead and zinc had been carried on on the upper New River beginning about 1750, and is more or less continuous since that time. The zinc industry in the upper New River commenced operation near Austinville in 1864, and has operated quite continuously since that time.

Q. Dr. Holden, will you state what historical sources you have examined or considered in connection with the question of what route and means of transportation were employed by these charcoal iron furnaces and lead and zinc industries on or near New River at and prior to 1886 when the Cripple Creek Railroad was built up to Foster Falls?

A. Well, a gentleman of some reputation, and once President of the United States, Thomas Jefferson's Notes on Virginia, and another source is the U. S. Engineers Reports. I think also there is considerable information in various volumes of the Virginias.

By Mr. Thompson:

Q. What did you consult?

A. I consulted Thomas Jefferson's Notes on Virginia, I
2230 consulted the U. S. Engineers Reports, I consulted the Virginias, and furthermore I have talked with the old residents in this region.

By Mr. Jackson:

Q. Have you consulted any other works upon the mineral resources of that region or of Virginia?

A. I have consulted everything that I could find.

Q. Did you examine the works of C. R. Boyd, entitled "Resources of Southwestern Virginia, showing the mineral deposits etc., and methods of transportation etc."

By the Court. Did you consult that particular book?

A. I did.

By Mr. Jackson:

Q. Is that book regarded as authoritative or not by historians or investigators in your field?

A. It is. I consulted also a reprint of the Geology of the State of Virginia by the State Geologist, W. B. Rogers.

Q. And how is that works regarded among students in this field?

A. As an official publication.

Q. Doctor, prior to the opening of the Cripple Creek Division of the Norfolk & Western Railroad between Pulaski and Foster Falls in 1886, what does your historical investigation disclose to have been the route and means of transportation to and from these charcoal iron furnaces and the lead and zinc industries on or within convenient access to upper New River?

By Mr. Thompson. Your Honor, we object to that on the same grounds that we have been objecting right along. He has been referring to this magazine called the Virginias, and we have got these four volumes of it and I note that these articles in here are not written by this Jed Hotchkiss—he is the editor of the magazine, and here, for example, it says "We are indebted to our well-informed friend and correspondent, John W. Robinson, Esq., of Graham's Ford, Wythe County, Virginia, for the

information under date of December 28, 1882, from which we have prepared the following full and accurate account of the operations during the year 1882, of the group of 16 charcoal iron blast furnaces located in the Valley on New River and its branches in Smith, Wythe and Pulaski Counties, Virginia, and known as the Southwest Virginia blast furnaces." And
2231 then he goes on to say: "In transmitting this data, Mr. Robinson writes: 'I am sorry to say that the outlook for 1883 is not very encouraging for the iron producers. The low price of iron and the high price of labor, supplies, etc., together with our remoteness from railroads, will deter the most of us from operating our furnaces until things are better. There are no new enterprises on hand and there will be none until we can get cheap fuel.'"

Now here is a newspaper reporting on the situation in the iron industry up there. We are not impeaching this man who is the editor of this magazine, but he was getting his information from some correspondent.

By the COURT. In any magazine there is matter written by correspondents. Take any ordinary trade magazine, it will undertake to give you the extent or the status or business conditions throughout the United States, and that is gathered from their correspondents.

By Mr. JACKSON:

Q. Just in brief, who was John W. Robinson?

A. John W. Robinson, I was acquainted with personally. At the time I knew him he was a Field Superintendent of Iron Mines for the Virginia Iron, Coal & Coke Company. At the time the Virginia Iron, Coal & Coke Company was formed, it was formed to no small extent around a neucleus of furnaces in which John W. Robinson was interested. John W. Robinson, if I remember correctly, married into the Graham family. The Graham family had been interested in using charcoal pig iron from 1800 to the time of the formation of the Virginia Iron, Coal & Coke Company.

Q. In this southwest Virginia field?

A. Yes, sir.

Q. And do you know whether he was connected with some of these furnaces you have named—charcoal iron furnaces?

A. He was the leading spirit in the iron industry in southwest Virginia and at times he was financially interested in several of them, and I think at times four or five.

Q. Can you name them?

2232 A. He was interested in the Barren Springs furnace. I think he owned the Barren Springs furnace, but off-hand, could not state definitely the furnaces in which he was interted, but they were in that list that I read, if I may go back to e list, I think I can indicate the furnaces which I think he was terested in.

By the Court. I don't think that is necessary.

Q. Doctor, now I will ask my questions: Prior to the opening the Cripple Creek Division of the Norfolk & Western Railad between Pulaski and Foster Falls in 1886, what does your storical research disclose to have been the route and means of ansportation to and from these charcoal iron furnaces and the ad and zinc industries on or within convenient access to New iver?

A. The history of these industries shows that the method of ansportation to and from the charcoal iron furnaces was by agon over wagon road to rail heads. In the very early days ansportation was overland to points further east in Virginia d elsewhere. It is true that some of the reports of the Chief Engineers of the United States Army show that some iron om Radford and Boom furnaces was boated down to New iver bridge about 1881 or 1882, the iron boated down New River New River Bridge, from Radford and Boom Furnaces during ose years did not include all the production of those furnaces, d represented only a small fraction of the iron production of e furnaces located on and within convenient access to New iver.

By Mr. **Thompson**:

Q. Are you reading from a book or is this your own view?

A. It is my own view.

I have not finished.

By Mr. **Jackson**:

Q. All right, continue.

A. (Continuing.) There is no evidence in historical records of ating from Radford and Boom Furnace—that it continued ter 1882 or 1883.

Q. Will you state, if you know, Doctor, whether or not any rt of the products of these charcoal pig iron furnaces of upper ew River, was marketed in Cincinnati?

A. In the year 1881, some of the production of eight of these charcoal furnaces was marketed in Cincinnati; some in
33 Saint Louis and some in Louisville.

Q. Prior to 1886, what did your investigation or study sclose to have been the routes or means of transportation to d from the industries engaged in the production or utilization lead and zinc located on or in convenient access to New River?

A. I know of no attempts to use New River to transport the products of these lead and zinc industries, and a study of their production—a study of their history discloses that their products were transported by wagon to the railhead, after the constructions of railroads. In the earliest days, prior to the construction of railroads, lead was transported by road to points eastwardly.

Q. In your study of the history of these industries—that is, the lead, iron, and zinc industries that were within easy access to New River, did you find reference to any available water transportation to and from them?

By Mr. THOMPSON. We object to the question.

By the COURT. I believe I will sustain that objection.

AVOWAL

By Mr. JACKSON. We except to the ruling of the Court, and state that through this witness, we offer to prove that he has made a study of the history of these industries, and that he has found, in the historical records, dealing with the beginnings and development of these industries, on and along and over New River, no records of available water transportation, except such transportation from Radford and Boom Furnaces as was referred to in the reports of the Chief of Engineers of the United States Army dealing with the years 1881 and 1882.

By Mr. JACKSON:

Q. Doctor, is there any work of an historical character, dealing with the history of these enterprises, to which you would like to particularly refer?

A. I should like to draw attention to a work entitled "Resources of Southwestern Virginia," showing mineral deposits, etc., of the various counties and methods of transportation, etc., by C. B. Boyd, published in New York in 1881, by John Wiley and Sons.

Q. Will you state whether or not, if you have not already done so, if that work is generally accepted as reliable among students in that field?

A. I have already stated so.

Q. Read such excerpts from that work as you deem pertinent to this point.

A. In treating of Pulaski county along lines of transportation——

By Mr. THOMPSON:

Q. What page are you reading from?

A. I haven't the page, but under Pulaski county——

Q. The title of the book is "Resources of Southwestern Virginia."

A. Yes, the Resources of Southwestern Virginia, published by John Wiley and Sons, 1881.

Q. Have you the book?

A. Yes, sir.

Q. Let's see it.

A. (Continuing.) (Reading:). "This county is directly
2234 in the great line—the great through line of railroads from
the Atlantic seaboard, through Tennessee to the west and south. The Atlantic, Mississippi and Ohio Railroad passes through the heart of the county from East to west. New River, besides being in line of navigation improvement under the auspices of the general Government, is also the line of the New River Railroad, now being constructed.

"This is also one of the proposed lines of the Petersburg–Pittsburg Southern Railway.

"The county is well supplied with good county roads, and one of them is a fine macademized turnpike."

In treating the lines of transportation in Wythe county, no mention is made of New River.

In treating of Giles county, at page 157, this is said:

"The New River is contemplated to be made navigable at some date by the United States Government, surveys having been made to ascertain the practicability, costs, etc. Some appropriations have been made and work done on the river, but none in this county."

In dealing with the lines of transportation in Carroll county, at page 294, I find:

"The United States Government had the river examined with a view to its improvement and the officer in charge made a favorable report on the scheme."

In dealing with manufacturies in Grayson county, at page 307, it is said:

"There are very few manufacturies"—

I think that word is spelled wrong. I think the original says "manufactories"—

"in the county, except a carding machine or two and Little River forge now in operation."

Q. About what time are you reading?

A. This was published in 1881. Here is a further paragraph:

"There are the usual grist and sawmills in every neighborhood, but being without the facilities of transportation, there
has been no inducement to build expensive factories of
2235 any kind, though the people are sufficiently enterprising."

By Mr. **Jackson**:

Q. You referred awhile ago to a work entitled "Reprint of Annual Reports and Other Papers on the Virginias, by Mr. Rogers, I think the State Geologist. Is there any excerpt from that work to which you wish to direct attention as pertinent to your testimony?

A. Yes, sir.

By Mr. **Thompson**:

Q. Have you a copy of that?

A. Yes, sir. [Continuing.] I find on page 111 in that work, this quotation:

"The lead ores of Wythe county, under judicious managing as now working, could, with favorable means of conveying the resulting metal to the proper markets, could not fail to become a large source of profit to the State."

By Mr. **Gatchell**:

Q. What page is that?

A. Page 111.

By Mr. **Jackson**:

Q. Anything further?

A. Then on page 140, quoting from a report in the year 1836, in speaking of the lead ores, etc., we find:

"The fact that by far the largest portion of the lead which these mines furnish is carried in wagons to Baltimore, is direct proof of the lucrative nature of the manufacture and strongly indicates the benefit which exists in this product and which the public may be expected to reap from the extensive works of improvement which have been so wisely projected in this portion of the State."

By Mr. **Thompson**:

Q. What is the date of that?

A. That was the report for 1836.

By Mr. **Jackson**:

Q. Are iron, lead and zinc industries included in what is known as the "heavy" industries?

A. Yes, sir.

Q. State, if you know, whether or not water transportation, where practical, is of any value to such heavy industries?

A. Water transportation, where practical, is of greater benefit to heavy industries, than any other type of industries; yes, sir.

2236 Cross examination by Mr. THOMPSON:

Q. There were no railroads in that country in 1836, were there?

A. Not to the best of my knowledge.

Q. After you put your ore on down New River, where would it go—to the Ohio?

A. If it didn't go to the bottom, it would.

Q. Thank you for that remark. Do you know anything about the New River Navigation Company, chartered by the State of Virginia?

A. No, sir.

Q. You never heard of it?

A. No, sir.

Q. You are an expert on navigation history in this part of the country, are you?

A. I am familiar with the things I have talked about here.

Q. And nothing else?

A. Oh, yes; lots of things.

Q. What was the nearest place for the reduction of lead ore in the United States at that time from New River?

A. I understand that lead ore was so reduced in the vicinity of the mine. It was carried across New River from the mine and handled on the opposite bank of the river.

Q. That is, the shot tower?

A. No, sir; the shot tower is on the same side of the river.

Q. The consumption in this country would be soon satisfied with what they could manufacture in the shot tower there?

A. Yes, sir.

Q. So your excess would have to go to Baltimore, which was the place where they had the great shot tower and they did reduce lead ores?

A. I don't know much about that, but I do know that this was the chief source of lead in the Eastern United States.

Q. Baltimore was?

A. No, sir.

Q. This place was?

2237 A. No, sir; Austinville was.

Q. Baltimore was the place of distribution?

A. No, sir.

Q. Where they made ammunition of one kind or another?

A. I expect so; I have no special knowledge of that.

Q. There would be no point in sending excess lead ore on down the river, after they had reduced it into its particular constituents for the market within that area; isn't that so?

A. It seems to me that the New River furnished the route for a considerable number of miles from the Lead Mines Eastward and Northward.

Q. Where were there any Towns on New River in the year 1836, from the Lead Mines North?

A. I don't know.

Q. There weren't any, as a matter of fact, were there?

A. I doubt if there were.

Q. So your only market was East, wasn't it?

A. It seems that way.

Q. There was no purpose in sending lead ores down New River——

By Mr. **Jackson**. When?

By Mr. **Thompson**. In 1836. That is the date that he gave in the book.

Q. That is the date you quoted there, isn't it?

A. If I had been doing it, I would have sought the easiest and cheapest way of doing it.

Q. How do you know going down the river was the cheapest way?

A. I don't know; apparently it was not, or they would have done it.

Q. Even though there was no market there?

A. It was some miles from the Lead Mines to Radford, and Radford would be the natural point for trans-shipment to Baltimore, by team.

Q. Isn't it a fact that there was a road running from up there in that district, and in a Northeasterly direction, to Lynchburg, out that way to Baltimore?

A. There was a road Northeast of the mines, known as the Lead Mine Road.

2238 Q. Yes, sir. And wasn't the means of transportation in 1836, that which would get them to the—that of getting the ores or whatever they shipped, to the James River and on down the canal?

A. I don't get that.

Q. Read the question. (Question is read.) The canal along the James River.

A. Where?

Q. At any point—Covington——

By Mr. **Jackson**. When was this?

By Mr. **Thompson**. In 1836.

A. I doubt if there was much navigation on the James River from Covington in 1836.

Q. Isn't it a fact that from Covington down, was the greatest course of carrying commerce in the State of Virginia—that is north or west, in 1836?

By Mr. Jackson. We object to that. There is no evidence to show that Covington even existed then.

A. I have a reference somewhere that zinc ores were hauled to Lynchburg——

Q. Hauled to Lynchburg——

A. Wait a minute—the suggestion was made that they might profitably be hauled to James River at a point west of the blue ridge, which would be the present Buchanan. I cannot give the reference, but my remembrance is that it said they could carry that in canoes, a ton to two canoes and that meant that at that time, there was transportation for 500 pounds of cargo from Buchanan, but I have no evidence that such transportation was used. It is simply a suggestion.

Q. When was the canal built at Lynchburg on the James River?

A. I do not know.

Q. Isn't it a fact that it was a going business and the biggest corporation in the State of Virginia, so far as income was concerned, in 1836?

A. If I remember correctly, canalization was completed to Buchanan about 1855, but as to the details of the development of that transportation, I do not have the details of.

2239 Q. If there was no demand up the river or down the river, or in Virginia or in West Virginia, wouldn't it be natural to find a market—to find a place where there was a market going East?

A. Yes, sir; you could not find a market where there was no market.

Q. What would be the point in going down the river, then?

A. Commodities seek the lowest cost of transportation. It seems to me that the natural route would have been the water route from the Lead Mines, which were located on the New River, to Radford, and thence by wagon to market—the final destination.

Q. You refer to Radford. When was Radford established?

A. In the early maps of the United States Geological Survey, the locality known as Radford is referred to as Central Lovely Mount, and in these papers published in the 80's, Radford was not known as such at that time.

Q. As a matter of fact, there was no town of any size there in 1836, was there?

A. I have no knowledge of that.

Q. Why would you think that they would ship goods down or material or commerce to Radford. Why couldn't they take the road at the Lead Mines?

A. Of course, they could—as a matter of fact, they did.

Q. Wasn't that the reasonable thing to do.

A. It was, if there was no water transportation. If there was water transportation, the natural route would be to go on water as far as you could, and Radford—where Radford now is, would be the Eastern limit, in my guess, for water transportation.

Q. Why go North and East, when you could go East. You have to go North going on the river.

A. It is my understanding that Baltimore is Northeast of the mine.

Q. You had to go to Lynchburg to go to Baltimore, did you not?

A. Yes, sir; you had to go Eastward, but the natural route of transportation from the earliest times, from New York to Alabama, has been along the limestone valleys, and the
2240 natural route for lead would be the same valley, Northeast.

Q. Even though your river was running Northwest?

A. Are you stating that as a fact?

Q. I am asking you the question.

A. (Examines map.) This is approximately North [indicating on map]?

Q. Yes, sir.

A. This is East [indicating].

Q. Yes, sir.

A. This is Northwest and the Lead Mines are here [indicating on map], and from here to Radford is Northeast [indicating].

Q. How much Northeast is it?

A. About 20 miles by river.

Q. You, as a transportation expert, and an historical transportation expert, now say that they ought to take the lead from Austinville and take it down the river to Radford, and then start it in an Eastern direction, or any direction that it might be, to Baltimore?

A. Some years ago—your question involves an assumption that is not necessarily in accordance with the facts. I am familiar with the region—this lead and zinc region and this Virginia iron ore region that we have discussed. I have little knowledge of transportation outside of that, except as I have obtained from my studies of history—the history of the iron ore industry.

Q. That is your answer to my question: That is your answer, is it?

A. I said further, some years ago, it was my private business transport hundreds of thousands of tons of tan bark and lumr for 16 miles by wagon.

Q. You are now speaking about your own experience. I am lking about the year 1836. You gave us a reference to 1836. Vhat this man Boyd or somebody had to say in some book.

By Mr. Jackson. You are wrong about that.

By Mr. Thompson. The Annual Report of the Geology of the irginias by Mr. Rogers. I am asking you about 1836.

Q. The best answer that you, as an historical expert on transortation, can make, is that you would take the lead down to adford, and then start East with it, rather than start East or ortheast with it from the Lead Mines, when they had a road ere?

A. You keep jumping off the track.

241 Q. I will try to jump back on the track. Will you answer my question?

A. The route down New River is strictly Northeast and transortation from the Lead Mines down to the site of Radford, ould be directly in line towards Baltimore.

Q. How far would it be to Radford from Austinville, by river. ake into consideration all of the bends and curves on the river?

A. I made a slight allowance for that on the scale, when I said was 20 miles.

Q. It is 20 miles—you say that, do you?

A. I expect it is a little further than that down the river.

Q. As a matter of fact, it is 44 miles, is it not, by the river?

A. (Witness examines map.) The straight line on this map, cording to my guess, it is 15 miles, if that map is correct.

Q. I am not asking you that. I am asking you what is the istance by the river from Austinville to Radford?

A. I never measured it.

Q. You told the Court that you would take an ore shipment Radford by the river and go east then, did you not?

A. That is my judgment of the way it should be done.

Q. That is the best answer that you can give, is it?

A. Yes, sir.

* * * * *

Q. I would like to ask you something about this Defendant's xhibit #550. You say this is a very reliable map, do you not?

A. The man who made it said it was particularly good, beuse it was based on the Norfolk & Western survey as a base ne.

Q. That would necessarily make it good, would it?

A. Well I presume the Norfolk & Western employed competent engineers, if they were going to spend a few million dollars building a railway.

* * * * *

2242 Q. I would like to ask you with regard to the iron ore deposits up on New River. Do you understand the term in mining called "gophering"?

A. I have heard it used.

Q. You have been in the West?

A. Yes, but not extensively, that is not for a very long time.

Q. Is it or not true that up the head waters, the upper region, there is a large deposit of iron ore throughout that country?

A. Not throughout the country. The iron ores that were mined for these charcoal furnaces were mostly in the form of nodules, scattered through the residual clay, which overlies the limestone of the Great Valley region.

Q. Isn't it true up around Foster Falls and all through that stretch there is a great seam, or deposit, we will call it, of iron ore, that runs through that country for a stretch of about thirty miles?

A. No such thing as a seam.

Q. I will withdraw the word "seam." What is the word for it?

A. Those as I said were nodules or iron ore scattered through the clay, sometimes they constituted as much as one-third of the total materials and other times they constituted not more than one ton in twenty. The iron ore was obtained from the clay by a washing process; many times they recovered less than one-twentieth of the amount of material they put through the washer.

Q. Isn't it true that really what they have done up there to a very great degree, not entirely, but they have really been gophering where they got a deposit that was rich they took that out and left the low-grade ore there?

A. What would you consider a low-grade ore?

Q. I am not an expert on iron ore, I could not tell you—I could on gold or silver, but not on iron ore. I have been in the district and that is the impression I got, and ask you if that is correct!

A. Let's make a correction on gophering. You are familiar with gold and silver, and gold and silver can occur in great values
in a very small place, and you can properly call that go-
2243 phering. Now iron ores do not. They are a bulky mate-
rial, and when you are getting one ton of ore out of twenty
tons of material it would be a gopher that resembled the dinosaurs of old—you are trying to get at the amount of ore left there?

Q. Yes.

A. Those deposits have been practically exhausted.

Q. Would you say this iron ore in the Southwestern part of Virginia along the river is gone?

A. No; those residual ores in the limestone clays have been largely exhausted; there are several deposits which I understand have not been completely mined out, but there is a deposit of ore in Carroll County which is being mined primarily for its sulphide content on a considerable scale and hauled to Pulaski where it is used in the production of sulphuric acid and the iron which was in the original material is a by-product.

Q. That gets close to what I am trying to being out. In other words, you still have a deposit left, which if it came to a necessity, suppose you exhausted your Lake Superior and Michigan deposits, there would still be something left up New River, wouldn't there? That is low-grade?

A. It is not low-grade, but it is the sulphide, and I do not know of a single case where a sulphide ore has been mined as an iron ore; in many cases sulphides of iron have been mined for the sulphuric acid content, and the by-product of those operations used as an iron ore. At the present time there are quantities of this material, which is called "Blue Billy" stacked at the City of Pulaski, for which there is no market.

Q. Coming to the lead mine, what is the deposit there?

A. It is what we call a disseminated ore.

Q. Is there ore left there?

A. There was the last time I was in the mine.

Q. And there is zinc there?

A. Yes, sir.

Q. And still quite a lot of zinc up in that part of the country?

A. If you knew the New Jersey Zinc Company you would know they are not going to let anyone know how much reserve they have there.

2244 Q. I know the New Jersey Zinc Company, and I know they wouldn't let anyone know, but as a matter of fact they have got reserves there, isn't that true?

By the COURT. Ask the witness if it is in his knowledge there is considerable zinc reserve there.

A. The last time I was down in that mine they were mining zinc, and I saw zinc in the walls. I haven't the slightest idea whether there is any zinc a foot away from those walls or not; presumably there is, but I have no knowledge of the tonnage held in reserve.

Q. How about lead?

A. They are intermingled, the lead and the zinc.

Q. In your study of geology up that river, have you noticed the fact there are quarries up there that are valuable stone quarries?

A. What kind of stone quarries?

Q. For instance one right near the Radford project where they got out a lot of rock and shipped it, haven't they?

A. I understand that was opened for limestone deposit, and the people who opened it had not made adequate investigation and found the limestone there was of very limited value and since that time they have been mining the dolamite which has been used for crushed stone.

Q. That is being used and shipped?

A. The last time I noticed it was being used.

Q. There are sand deposits up that river?

A. What do you call sand?

Q. For cement works, etc.

A. Unfortunately some of that sand has been used for cement work.

Q. And it worked out?

A. Yes, it worked out dreadfully.

Q. You don't think there is sand up there for that industry?

A. Anyone that wants to can use it, but not in any of my concrete will there be any of that sand.

Q. There are also clays up there that are valuable?

A. There is a plant up there producing ochre.

2245 Q. Do you know any other geological deposit up there valuable for any commercial purpose?

A. I can conceive of a whole lot of things that could be used up there, but off-hand I don't think of anything that has much commercial prospects.

Q. Any coal up there?

A. No.

* * * * *

Q. You referred in your examination in chief to an engineer by the name of Boyd, who, I believe, has written quite a volume on geological matters in the State of Virginia?

A. I referred to Boyd, yes.

Q. Is he regarded as an authority?

A. Mr. Boyd was a Wytheville man, and it is my understanding that he traveled widely over this country and probably had better first hand knowledge of the country than anyone else I can imagine.

Q. Now, did you read his report that was attached to the report of Major Craighill in 1872?

A. I glanced through it. I did not read it critically.

Q. When did you do that?

A. Oh, a week ago.

Q. And not previous to that time?

A. No.

Q. Do you recall this paragraph in his report:

"Assuming that the mineral interests of the country tributary to New River are, or will be, of paramount importance, I have devoted the body of this report to that subject.

"That section of country contiguous to and likely to supply tonnage at once to a New River improvement, beginning at its southwestern limit, is the following: A part of the counties of Ashe, Alleghany, and Surry, in North Carolina; parts of the counties of Carroll, Grayson, Wythe, Pulaski, Montgomery, Bland, Tazewell and Giles, in Virginia; and the counties of Mercer, Monroe, and Summers, in West Virginia; comprising an area filled with apparently inexhaustible deposits of iron-ore of high grade, coal, lead, zinc, copper, baryta, salt, alumina, sandstone, (millstone and grindstone grit), limestone (both ordinary and magnesian), and sometimes strong indications of beds of gypsum, some of which leads of ore are exhibited nearly in their actual position upon the accompanying map." 2246

Do you recall having read that?

A. I don't remember the detail wording. I can well imagine that it is there.

Q. Do you agree with that statement?

Mr. **Jackson**. I suggest that he show it to the doctor.

Mr. **Thompson**. I was reading from Government Exhibit No. 31 (handing same to the witness).

A. The question is if I agree with that?

Q. Yes.

A. To a certain extent, in some respects, it was too optomistic and in other respects was not optomistic enough. In those days the knowledge of ore deposits was not what it is now. Someone has said that the only good description of a mine is an obituary and in many cases ore deposits turn out to be vastly greater than the report indicates. I could call your attention to a number of instances of that kind in Virginia.

Q. Are any of them up in the New River district?

A. No, I can't say that there are, but I feel quite sure that the early geologists did not visualize even approximately the form in which these ore bodies occurred. I doubt if they realized that there was as much zinc as there has proved to be in the Austinville mines.

Geologists in those days were inclined to think of things in leads; they were inclined to think of veins of indefinite extent; they would find a deposit in one point and another hundreds of miles away, and draw a line between, and assume that they had had solid ore all between. While it was not proper it was quite generally done.

Q. But, generally speaking, you would agree with his report, would you not?

2247 A. I would agree with that part of the report which deals with things which, as an ordinary individual, he could see from his own observation.

Q. And you did consider him a man, I think you said, about as familiar as anybody with that part of the country?

A. First, I was not back there at the time, but I understand he spent many years doing very little else than going back and forth over that country looking into mineral possibilities.

Q. Have you heard of the discovery of manganese up the river?

A. Where?

Q. On New River, or are there any manganese deposits?

A. How close to New River?

Q. Well, I couldn't tell you that, but the Press has carried that story from time to time within the last three years. In Montgomery County and Giles County?

A. There is a deposit that is being mined on the Bland-Giles County line at the present time, and it was a right promising deposit. Now, there are two appearances in Montgomery County that have been prospected in recent years, but I gather that they are more promotion than mining operations.

To be specific, representatives of the large interests came down here from New York, and got me to take them to see what was characterized as a million tons in Montgomery, and it was within quarter of a mile of New River. I said it was a waste of time to go down there. They said, "Well, we came all the way from New York to see it." Well, I said, "I will take you down there." I took them down there.

Q. Was this in Montgomery County?

A. Yes. It was on the corner of Montgomery, Giles and Pulaski. I said, "Here is your mine; now, show me the manganese," and they were unable to even show me a specimen; they were unable to show me anything that I was willing to admit was manganese. So there have been some very large stories about manganese in that section of the country, which have no basis whatever. There is a little manganese which has

2248 been mined not far from New River.

Q. In what form does manganese appear?

A. Mineralogically or geologically?

Q. Mineralogically?

A. Three forms—mineral——

Q. I mean, in what form is the deposit physically?

A. You mean geologically?

Q. Yes.

A. In this country it is a superficial deposit, the result of weathering activities, and in the Butte region it occurs in vein form and occurs at depth, but here manganese is limited to mere surface appearance. We have a number of these occurrences in Virginia. One of them, in the Allegheny Mountain region, in association with the Oriskany and sandstone. We have manganese again along the west base of the Blue Ridge.

Q. I want particularly down through that part of the country along the river. That, you say, is the surface form?

A. It occurs disseminated at shallow depths. I do not know of a single deposit that could be called manganese ore that is contiguous to New River. There are some deposits that have been mined there with iron ore rather high in manganese.

Q. Have you heard of deposits, exposed or prospective, at Dennison?

A. Where is Dennison?

Q. I think either Montgomery or Giles County.

A. I never heard of Dennison.

Q. Have you ever heard of Herron?

A. No.

Q. Eaton?

A. No.

Q. Linkous and Shumate?

Mr. Jackson. Are they towns?

Mr. Thompson. That is the way it is designated, as "Linkous and Shumate deposits."

2249 A. What is the name of that?

Q. A manganese deposit in western Virginia by G. W. Stose, 1922?

A. I do not know of any deposits by that name that have ever amounted to anything. The only deposit in the report in this region that amounted to anything was the one I mentioned on the Bland-Giles line, and that is known as the Stange mine.

Q. That covers 27,500 acres, doesn't it? The Stange?

A. The number of acres that it covers depends on the number of acres Mr. Stange owns. Mr. Stange owns a large boundary up in there, but, so far as I know, he has never opened that except in one place, and he has done all his mining in one particular locality.

Q. Where is that located with respect to New River—how close?

A. May I get a map?

Q. Yes.

A. I would answer 16 miles in a direct line.

Q. Now, have you heard of the others which are referred to in the Stose report of 1922—the Hare?

A. I am very much interested in manganese and consider that the Oriskany manganese and the Oriskany iron ore have had approximately the same origin. So it has been my business to visit the manganese deposits which seem to be of the Oriskany type.

Q. Have you ever been on Beamer?

A. No.

Q. On No Business Creek?

A. I know where it is, but I have not visited any manganese deposits on this.

Q. On Flat Top?

A. I am not sure where Flat Top is, but I do not recall having visited it.

Q. On Johnson?

A. I don't think so.

Q. On Thompson?

A. I don't remember it.

2250. Q. Isn't it a fact, Doctor, that you have made your transportation study within a very recent date?

A. In connection with my study of the history of the iron ore industry, transportation has been a part of the study. I gave particular attention to the early ore industry, particularly before the development of the coke furnace, and the charcoal furnaces were, for the most part, located close to their ore supplies, and the transportation there was mostly by cart or by wagon, and there was little occasion to give attention to that. I was concerned to a small extent with deposits of other products, pig iron products, but my business was mostly concerned with the ore itself, and I was supposed to rest when I got it to the furnace, and I might say my study of transportation has been contemporaneous with my study of iron ore deposits, and that runs over a period of 35 or 40 years.

Q. Did you ever talk to a man by the name of R. L. Howard whose father operated the Howard's Ferry and who has testified in this case?

A. I don't recall.

Q. Did you ever talk to a Mr. William Collins, who lives at Salem, Virginia, and who in the early days lived at Towe's Ferry on New River, and who has testified in this case for the Government?

By Mr. Jackson. I think you should specify the time.

By Mr. Thompson. Any time.

By Mr. Jackson. That is too vague and indefinite for cross examination.

A. My dear sir, some days there are a dozen people in my office and I don't know their names.

Q. So far as you know you have never talked to Mr. R. L. Howard, or Mr. William Collins about the boating of pig iron down New River, have you?

A. If I did I have forgotten it, or I did not know his name at the time.

Q. And you didn't make any notes about it?

A. I don't remember any.

Q. Did you ever talk to a man by the name of Lewis Harvey, whose farm is located near the Radford dam site, in fact just back of the dam site?

A. In as much as I spent about three years in that vicinity, I might have easily talked to Mr. Harvey, but I do not recall it.

Q. You did not make any notes of it?

A. I don't recall it.

Q. Did you ever talk to J. W. Flannagan who resides at Radford and who testified for the Government?

A. I have talked a good many times to a man named Flannagan, but I do not recall discussing iron ore or New River problems with him.

2251 Q. With none of these men did you ever discuss the question of boating iron ore down the river, or pig iron?

A. I don't recall I ever did.

Q. I believe you testified you found no historical reference to transportation of pig iron by boat later than the year 1882 or 1883?

A. I don't recall finding any.

Q. You say you don't recall?

A. I don't recall finding any such records.

Q. I will ask you if you do not know the cessation of transportation by boat of pig iron was occasioned only by the closing of the furnaces in 1884 or 1885?

A. No, I don't know that.

Q. You don't remember it or you have never known it?

A. The records indicate the furnaces continued to produce.

Q. And do you know the closing of the furnaces was occasioned by general business depression about that time?

By Mr. Jackson. I object to that question. He testified they didn't close.

A. It is a rather strange thing that these furnaces continued to operate after the poor prices of iron set in. They had had prices on iron which were double the prices which prevailed subsequently and it resulted in a large amount of furnace building and rebuilding. In the early eighties they had what was for the owners a very large investment, and at the beginning of 1883 the prospect in the iron manufacturing business was very gloomy indeed.

The records showed the Virginia production of iron 14,000 or 16,000 tons in '80, '83 and '84. Prior to that time 75% or 73% to be correct and exact was produced by the furnaces along New River. It is a reasonable expectation that a corresponding percentage of that 14,000 or 16,000 tons was due to the furnaces along New River; therefore I think I am justified in saying the furnaces did not shut down completely. As to why they shut down, how can I say that it was due to the depression?

Q. I believe you said you read the reports of the Chief of Engineers, did you not?

2252 A. I glanced through them.

Q. That was one of your sources of information you had, as you testified on Friday?

A. I looked through them, particularly with a view of seeing what transportation they recorded as having taken place on New River.

Q. I direct your attention to Government Exhibit #42, the same being the Annual Report of the Chief of Engineers, War Department for the year 1886, page 1602, being a part of the report of Col. William Proctor Smith, Assistant Engineer in charge of channel improvement on New River, to Lt. Col. William P. Craighill, under date of November 30, 1885, and read to you as follows: "It is not necessary to say anything about the other two divisions of New River, as there was no work done on them, nor were the channels examined; but from inquiries it is thought that the channel-way made in former years still keeps open, and bateaux are in constant use on them, iron having been shipped to New River Bridge up to the time of the suspension of the furnaces by the prevailing hard times."

8

Now do you agree with that statement?

A. My judgment is while this fellow might have been a good engineer he wasn't much of an economist, "but from inquiries it is thought the channel-way made in former years is still open." You will notice he is not sure the channel-way is open, and furthermore you will see he has not made a personal investigation. The sentence continues "and bateaux are in constant use on them." The balance of that clause beginning with "and" and ending with "them" is predicated on the inquiry which he had made, and not on personal observation, and he don't seem to be very sure about it.

Q. Don't you think Col. Smith was in a better position, he having been located on that river, than you are today, to tell what the conditions were there?

A. I don't see you have reliable evidence here there was any iron transported under the date of this report, or immediately preceding it.

2253 Q. I am asking, isn't his statement the suspension of the furnaces by prevailing hard times—that he would be in a position to know that better than you?

A. I would not be convinced to that statement that William Proctor Smith was correctly informed, particularly when we have statistical data to the contrary.

Q. Didn't you give this report as one of the sources of your information?

A. I had looked over this, and saw the item you referred to, but I didn't consider it reliable evidence in view of the other information I had that transportation was continued.

Q. On page 5017 of your testimony you said in reference to your sources of information, that you consulted Thomas Jefferson's notes on Virginia. Will you please tell us where there is anything in Thomas Jefferson's notes on Virginia discussing the question of the transportation of pig iron or iron ores?

By Mr. **Jackson**. I object to the form of the question, because the witness never testified he consulted Jefferson's notes about pig iron, but about lead and zinc.

Q. Let's go back to your testimony, page 5016 and 5017: "Dr. Holden, will you state what historical sources you have examined or considered in connection with the question of what route and means of transportation were employed by these charcoal iron furnaces and lead and zinc industries on or near New River and prior to 1886, when the Cripple Creek Railroad was built up to Foster Falls?" I am asking if there is any reference in the Jefferson document you speak about with respect to the roads upon which the ore was transported or the means by which the iron, the pig iron was transported?

A. He said iron or lead or zinc. I don't recall any reference in Jefferson in regard to iron but there is reference in regard to zinc.

By Mr. **Jackson**. And lead.

Q. I am asking about pig iron.

By Mr. **Jackson**. He has told you.

A. I answered that.

2254 Q. So you say there is no reference with reference to pig iron?

A. There is a reference in regard to iron in eastern Virginia.

Q. But not along New River?

A. I don't recall any such reference.

Q. You would recall it if there was such reference there?

A. If I had seen it I probably would.

Q. You have it in front of you?

A. Yes, sir.

Q. And there is no reference there?

A. I don't see any.

Q. You also in answer to Mr. Jackson's Question gave as one of your authorities the Virginias. Will you indicate in the Virginias Magazine in 1882, Vol. 3, page 52, and 1833, Vol. 4, page 5, where it makes any reference to the manner of shipment or transportation of pig iron?

A. In paragraph #1 it is said, "The iron made was sold in St. Louis, Cincinnati, Baltimore, and Wilmington," and paragraph #4 he makes the same statement.

Q. Does he say how the pig iron was transported?

A. It does not say how it was transported.

Q. So it doesn't show whether it was carried down New River by boat or any other way?

A. It doesn't say how it was transported.

Q. Have reference now to the 1883, Vol. 4, page 5, is there any reference there as to how the pig iron was transported?

A. In paragraph #7 he speaks that the furnaces had to blow-out on account of scarcity of transportation.

Q. But it doesn't indicate what kind of transportation?

A. Not in that paragraph.

Q. Or in any paragraph there?

A. I don't see any.

REDIRECT EXAMINATION

Q. During your cross examination on Friday, Dr. Holden, you
were asked what was the distance from the Lead Mines to
2255 the point on New River where Radford now is, and I
wondered if since that time you have checked that over?

A. I based my answer on this map, and I can see now I went from the extreme ends of the scale and not from the zero point.

Q. Will you state now what the distance would be approximately?

A. From where to where?

Q. From the Lead Mines northeast to the curve of the river, approximately to where Radford now is?

A. Well in a straight line I would estimate it was twenty inches which would make it forty miles, by river.

Q. About how far would it be about by the Lead Mines road to a point approximately opposite the curve of the river near Radford?

A. You said by the Lead Mines road?

Q. Yes, if that is the right road.

A. The Lead Mines road would not be the road which you would take today to go from the Lead Mines to Radford because there is a poor, indirect road from Childress to Radford.

Q. What I would like to get would be what would be the comparative distance by road from the Lead Mines down to the curve of the river near Radford?

A. I would make a guess there wasn't much difference.

Q. Between that and the distance you gave by river?

A. Yes, sir.

Q. And does that road which you now refer to pass along the river at Allisonia?

A. Yes, sir.

Q. And about how far from the river is it when it goes down to the vicinity of Radford or where Radford now is?

A. Well the road which existed at the time this map was made is directly at the river.

Q. Before the railroad do you know whether the through road crossed at Ingles' and Pepper's Ferry?

A. I think Jefferson speaks of the zinc being hauled to Lynchburg, and I think in that case they would have stayed on 2256 the south side of New River and gone through Christiansburg.

By Mr. Jackson. I produce what appears to be a letter in longhand addressed to Dr. J. E. Williams, Dean V. P. I., Blacksburg, Va., dated February 2, 1936, and signed by R. J. Noell, and ask to have it marked "Defendant's Exhibit #551" for identification. (Letter marked as requested.)

I also produce what appears to be a carbon copy of a letter dated March 2, 1936 addressed to Hon. R. J. Noell, East Radford, Virginia, and without signature, except "Dean of the College" and bearing the initials "JEW" and ask to have it marked "Defendant's Exhibit #552" for identification. (Letter marked as requested.)

I also ask to have marked as "Defendant's Exhibit #553," for identification, letter on the letterhead of Virginia Polytechnic Institute, Department of Geology, Blacksburg, Virginia, dated March 4, 1936, addressed to Hon. R. J. Noell, East Radford, and appearing to be signed by R. J. Holden, Professor of Geology. (Letter marked as requested.)

Q. Dr. Holden, you have already I think identified the letter I have had marked Defendant's Exhibit #553 for identification, as the letter which you wrote to R. J. Noell. Is that right?

A. I think this is the letter.

Q. I direct your attention to the first paragraph in which it says, "Your letter to Dean Williams and a copy of his letter to you have been referred to me," and show you Exhibit #551 and 552 for identification, and ask you whether #551 is the letter of Mr. Noell referred to you, and if #552 is a copy of the letter Dean Williams referred to you?

A. I believe them to be.

By Mr. **Jackson**. We offer in evidence Exhibits #551–552–553 in connection with the examination of Dr. Holden.

By Mr. **Thompson**. No objection to them going in.

By Mr. **Jackson**:

Q. I am not sure whether I asked you what is your position in the Department of Geology at Virginia Polytechnic Institute?

A. I am the head of the Department and have been for twenty-nine years.

By Mr. **Jackson**. I would like to read the letters just filed, if the Court doesn't think it will take too much time.

By the **Court**. All right.

Note.—Whereupon letters filed as Exhibits Nos. 551, 552 and 553 were read by Mr. Jackson, as follows:

"2-28-36
East Radford, Virginia.

Dr. J. E. Williams, Dean V. P. I.
Blacksburg, Va.

Dear Mr. Williams: I would be very glad to get as much information about the old iron furnaces that have been operated along New River as can be reasonably obtained. What furnaces, when they started, how operated and how long. The iron ore supply and how transported to the furnaces, especially as to being carried in boats on New River, also the disposition of the pig iron and how it was carried to railroad or the market; as to that located down the river and that hauled by teams from and to what places; especially that going down the river and any shipments out of the State. Also as to lumber, tan bark, 2257 staves, logs, wheat, corn and provisions or any products carried in boats up or down the New River and when, from and to what point, passengers, etc.; as well as rafting logs, staves, lumber, etc. I understand your library contains a copy of T. L. Watson's "Mineral Resources of Virginia" and which contains on pages 402–488 a chapter of Dr. Holden on iron, and this article contains on page 479 a list of furnaces in Virginia, also a book in your library "Virginia Iron Manufacturers in the Slave Era", by Kathleen Bruce. This book was published in 1931 and opposite page 452 it contains a map of Virginia showing the location of the iron furnaces in Virginia with names and considerable information as to some of the furnaces.

"I understand Dr. R. J. Holden is the best authority on these matters and I would be obliged if you could talk to Dr. Holden and apprise him of our appreciation of any information he will give us.

"My best wishes to you and Dr. Holden.

Very sincerely,

R. J. NOELL."

Then there is a footnote saying:

"Dr. WILLIAMS: If not asking too much will you kindly get your stenographer to type three copies of this letter and mail to me in your reply, as I am so pressed for time I could not look up a stenographer?

RJN"

Now #552:

"MARCH 2, 1936.

Hon. R. J. NOELL,
East Radford, Virginia.

DEAR SENATOR: Your letter of February 28 has been received and is being referred to Dr. R. J. Holden who, I am sure, will be glad to give you such information as he may have. Dr. Holden knows more about furnaces than all of us here put together. In fact, in my opinion, he knows more about them than anyone else in Virginia.

"Louise was glad to make three copies of your letter, and I am enclosing them herewith.

Very sincerely yours,

——— ———,
Dean of the College.

JEW:LA
Enc.

2258 #553 reads:

"VIRGINIA POLYTECHNIC INSTITUTE,
DEPARTMENT OF GEOLOGY,
Blacksburg, Virginia, March 4, 1936.

Hon. R. J. NOELL,
East Radford, Virginia.

DEAR SIR: Your letter to Dean Williams and a copy of his letter to you have been referred to me.

"To give you all the information in regard to the furnaces on New River and Cripple Creek in typewritten form will require a large amount of typewriting. A description of these furnaces was published in 1858 in the IRON MANUFACTURER'S GUIDE. This gives all the furnaces and forges that were known at that time. It contains some information on iron operations that had been abandoned scores of years before that time. A record of the operation of these furnaces from 1876 to recent time is contained in the printed records of the American Iron and Steel Association, copies of which are available in the Congressional Library in Washington. In the VIRGINIAS, a magazine published by Jed Hotchkiss, Staunton, 1880–1885, there is rather detailed information in regard to furnaces of this region, mostly from the pen of John W. Robinson.

"Last year J. A. Whitman of Wytheville, Virginia, published a twenty-page pamphlet entitled THE IRON INDUSTRY OF WYTHE COUNTY FROM 1792. I presume you might be able to obtain a copy of this from Mr. Whitman.

"While I have first-hand knowledge of all of the furnaces in this region which were standing thirty years ago, my memory is vague in regard to some of them, and I will have to consult my notes and read through a large number of notebooks and find scattered items which will be contained therein. If you cannot obtain this information in printed form and will tell me definitely just what information you require, I will see what I can do to get it for you.

Very truly yours,

R. J. HOLDEN,
Professor of Geology.

2259 Q. Dr. Holden, did you ever receive any reply to your letter, Exhibit #553?

A. I don't recall I ever did.

RECROSS EXAMINATION

Q. If I understood you correctly, I understood you to say that ore hauled from the Lead Mines would go by way of Snowville to Christiansburg, on that road. Am I correct in that understanding?

A. I do not know that I said that, but the easiest road from the standpoint of the topography of the country would be along the Great Valley, possibly as far as Roanoke, and such a route would take them through Christiansburg.

There is a shorter route by going across and through Floyd County, possibly across part of Carroll, but it is a very rugged country and I doubt if anyone would take that route with heavy haulage at that time.

Q. There has never been any road down the river from Austinsville to Radford that anybody ever attempted hauling any heavy loads, has there?

A. Part of the way it was close to the river, and part of the way it was not very close, but even at Christiansburg that road is only, in a direct line, about seven miles from the river.

Q. The most direct route was by Snowville, was it not, from the Lead Mines and to Christiansburg?

A. I think it would be.

2260 H. S. SLOCUM on Direct Examination testified as follows:

I am an engineer in charge of construction of the Winfield Development of the Kanawha Valley Power Company, an engineer in charge of construction, Appalachian Electric Power Company, Radford Development. I have been with the Appalachian Electric Power Company since May, 1929. I am also employed by and I have been with the Kanawha Valley Power Company since May, 1934. I spend most of my time with the Kanawha Valley Power Company at Winfield, and part of the time at Radford.

(Witness identified an album, Defendant's Exhibit 554, containing 60 photographs and the map in front of the album on which are the words "Appalachian Electric Power Company, location map for pictures, re—navigability of New River.")

I had those photographs taken in November, 1931. They were taken from a point about 2 miles below Austinsville to a point about one mile above Eggleston. I did not take the pictures myself. They were taken by a photographer named C. D. Fowler of Bluefield, West Virginia. He took them in my presence and in pursuance to my direction and request.

Q. Do the pictures appearing in this album represent a fair and accurate portrayal of the river and the riffles referred to in each photograph, at the time they were taken?

A. Yes, sir.

Q. Now please look at the map in front of the album on which are the words "Appalachian Electric Power Company, location map for pictures, re—navigability of New River," and state whether or not the photograph, or rather the location of the numbers from one to sixty appearing on that map indicate the reasonable proximation of the places where the pictures similarly numbered were taken along New River?

A. Yes, sir.

By Mr. ABBOT. We now desire to offer this album, containing 60 photographs, and the identification map in evidence. The identification map is not offered as any evidence of the

2261 State Line, or anything like that, it is simply offered with reference to showing the location where these pictures were taken for the use of the Court and counsel.

(Said album, together with the identification map and the 60 photographs is here filed in evidence, and is marked Defendant's Exhibit 554.)

The first series of photographs were taken on the 4th, 5th and 6th of November, and the second series were taken on the 24th, 25th and 26th, of November. The part of the river involved in the pictures taken on November 4, 5, and 6, is that stretch of the river from a point 2 miles below Austinsville down to a point one mile above Eggleston. The section of the river involved in the photographs taken on November 24, 25 and 26, was practically the same stretch of river, at least a great part of the same stretch was taken in the second series. We started on November 4, from a point 2 miles below Austinsville, about 9 o'clock in the morning. From the point where the first photographs were taken down the river to Foster Falls, the transportation was by means of an automobile. From Foster Falls we transported the photographer and camera in a boat. We started down the river from Foster Falls around 10 o'clock in the morning.

Q. Why did you take a boat at Foster Falls?

A. When I received instructions to take these photographs there seemed to be two alternatives to use to transport the photographer and the equipment, one was to walk the entire distance along the river and the other was to use a boat to transport the photographer and equipment. There are no roads paralleling the river at that point.

The boat was 19½ feet long, 3½ feet wide, and about 18 inches deep. When loaded with the 4 men and the equipment it would draw about 5 inches. In this country, this type of boat is called a canoe. In the Ohio River country it is called a John boat and in the north it is called a Punt. It is entirely different from what is usually termed a canoe. It is made out of plank, very roughly made and strongly made, and is utilized for rough work and rocky rivers. It stands a great deal of punishment. The boat came from the Radford Development. They had it
2262 around there and used it in transporting the men across the river, or ferrying them across the river.

When we left Foster Falls we expected to reach Whitt's Ferry on the first day. On the first day we reached Allisonia at 5:30 in the afternoon and the men were tired and wet, and we decided to stop there for the night, we had to. We had gone about 10 miles. It was a very rough trip, the boat was grounded a great many times, and it was necessary for the men who worked the boat to get out on the rocks and pull it over the ledges, and sometimes it was necessary for the passengers to get out and help to work the boat over, and at other times it was necessary for the passengers to walk along the shore to permit the men to lead the boat over the long stretches of shoals.

In one place the ledges ran parallel with the course of the river, and it was very difficult to find a place through these ledges to get the boat through. The ledges ran parallel with the river in one place, around a bend of the river. That was below Foster Falls, I don't know exactly but I would say 2 or 3 miles below.

We had 2 workmen on the boat, one for the bow and one for the stern. They got the boat down the river by using paddles whenever there was slack water, but most of the time it was necessary to pole it down and they used poles to fend the boat from the rocks, and also to pry it off the rocks when it was hung up. In several cases it was necessary for the photographer and myself to get out of the boat because the river was so shallow.

The first day, November 4, about an hour and a half was consumed taking photographs, I did not keep track of it.

On November 5 we covered that section of the river from Allisonia to Old No. 6 Dam Site. We left Allisonia at 7 o'clock in the morning. The men took the boat down the river to Clark's Mill, and the photographer and myself went along the shore in an automobile, over a stretch of about 4 miles. There was a road paralleling the river for that stretch of about 4 miles. We left Clark's Mill about 8:30 and went down the river and landed at Whitt's Ferry. We used the boat from Clark's Mill to Whitt's Ferry. We left Whitt's Ferry about 4 o'clock. The trip 2263 that day in the boat was more difficult and more arduous than on the preceding day, the rocks were more numerous, and while there were not so many shoals, the ledges were higher and more dangerous and the boat was in danger of capsizing several times.

The photographer and myself did not stay in the boat all that day, we got out on that day several times to permit the men to lead the boat down while we walked down the shore. I would not say the trip was made in good time, because it was very difficult to work the boat, it took a great deal of time, and also took time to find openings through the ledges which would be wide enough to permit the boat to go through. It is about 6½ miles roughly speaking from Clark's Mill to Whitt's Ferry. After we arrived at Whitt's Ferry, we transferred from the boat to an automobile and went down the river along the road which parallels the river.

On November 6, we started at the city of Radford. On the day before we had gone from Allisonia to Old No. 6 site which is about 4 miles above the present Radford site. On this first expedition of 3 days, we did not cover the river entirely between Development No. 6, and the town of Radford. On the morning of the 6th we went up as far as Ingle's Falls, or Ingle's Ferry and took pictures of that and then went down the river.

On the second trip, November 24, 25 and 26 we covered practically the same stretch of river as we did before, or a large part of it.

On the 24th of November, we covered a stretch between McCoy and the city of Radford. McCoy is just above the Big Falls on the Giles-Pulaski County line. On that day we used an automobile for transportation.

On the 25th we took a boat from Owen's Ferry to Whitt's Ferry—in other words, we went by automobile to Whitt's Ferry then drove across country around to Owen's Ferry and then took a boat from Owen's Ferry to Whitt's Ferry.

On the next day we went to Foster Falls, and had the same boat we used on the previous trip, and the same men, and went from Foster Falls to Allisonia. We had about the same experience as we had before, it was very difficult and arduous.

On the 26th we covered that section of the river between
2264 Foster Falls and Dalton, just below Allisonia. The boat was taken up to Foster Falls on a truck from the Radford Development. Allisonia is 3 or 4 miles from Delton. At Allisonia we sent the boat back to Radford on a truck.

Q. Do you know what the stage of the river was when these photographs were taken?

A. It was low, the river was low.

Q. Why did you take the pictures in this low-water season?

A. I was told to take the shoals, to take the rocks and anything that would show the real character of the river bed. It would seem that that time was the best time to take them, at least we thought the best time to take the pictures was when the water was low.

Q. Are there pictures here covering the entire river from below Austinsville to above Eggleston?

A. No, sir; they do not cover the entire river.

Q. What part of the river did you take then?

A. We took the most conspicuous and prominent ledges, shoals, rocks, and obstructions.

Photograph No. 1 is a view taken from the left bank looking up stream showing ledges and projecting rocks. It was taken 2 miles below Austinsville, or about 2 miles.

Photograph No. 2 shows a more close up view of the same ledges crossing the river, 2 miles below Austinsville. Both of these pictures were taken from a point approximately 2 miles below Austinsville. Photograph No. 2 is intended to show more details than No. 1. It shows the depth of the shoals, the height of the ledges, and things of that sort.

Photograph No. 3 is a view from the right hand bank at the lower drop of Foster Falls looking up stream. It shows the ledges crossing approximately at right angles to the stream, also numerous water worn boulders in the foreground. The man in the foreground is W. H. Smith, who was one of the men that helped to work the boat down the river.

Photograph No. 4 is a more detailed photograph showing the same ledge as is shown on the previous photograph, with W. H. Smith in the foreground, and it gives a comparison of the
2265 height of the ledge. That is the ledge further down stream at Foster Falls.

Photograph No. 5 is a view taken from the left bank looking up stream and across the stream to show in a general way the ledges crossing the river at Foster Falls. This picture was taken from an elevation looking down on the ledges.

Photograph No. 6 is a view just below Foster Falls Ferry and shows Foster Falls in the background, shows the ferry, also the ferry boat, and also shows the ledge from which the previous photograph was taken or the bluff on the river bank.

Photograph No. 7 is a view ¾ of a mile below Foster Falls showing a ledge extending approximately at right angles across the river ¾ of a mile below Foster Falls. This was taken from the right bank of the river. The man in the foreground is one of the workmen who took the boat down.

Photograph No. 8 shows a ledge ⅞ of a mile to a mile below Foster Falls, which ledge extends across the river and shows a gravel bank along the river and a gravel bar across the river. It boat was left for comparison with the ledge in the distance. The boat was left for comparison with the ledge in the middle of the picture. I believe that is the same ledge that is shown in Photograph No. 7. The ledge furthest up stream is the ledge shown on Photograph No. 7.

Photograph No. 9 is a view from the right bank, 3 miles, about 3 miles below Foster Falls, showing the ledges crossing the river and boulders in the foreground, and some projecting rocks.

Photograph No. 10 was taken from the right bank, taken from the Norfolk & Western grade, looking down on the ledges and shows several ledges crossing the river and also rocks projecting from the water. That picture was taken roughly 3¼ miles below Foster Falls.

Photograph No. 11 was taken slightly down stream from the point where Photograph No. 10 was taken. It shows the same ledges in the distance.

2266 Photograph No. 12 was taken from the left bank just above Carter's Ferry, and shows the ledges extending across the river at approximately right angles. It shows the gravel bar about the middle of the river and water worn boulders.

Photograph No. 13 was taken from the same point as Photograph No. 12, that is above Carter's Ferry, and shows in detail one of the main ledges crossing the stream.

Photograph No. 14 was taken from the left bank near Barren Springs. It shows ledges crossing the river and gravel bars in the river.

Photograph No. 15 was taken from the right bank of the river near Barren Springs station and shows the ledges crossing the river.

Photograph No. 16 was taken from the right bank of the river about 1 mile above Big Reed Island, and shows the shallowness of the water, and that is one of the points where it was necessary for the passengers to leave the boat and follow along the bank while the men worked the boat over. There is an indication of ledges on the right hand side of the picture and also gravel bars in the foreground. The boat in the picture is the same boat that we used that day and the same workmen. Big Reed Island is not very far above Allisonia.

Q. I show you photograph No. 17 and ask you where that was taken and what it shows.

A. This photograph was taken three-fourths of a mile above Big Reed Island bridge and shows the ledges and projecting rocks and water worn boulders and the shallow conditions at that time generally.

Photograph No. 18 was taken from the left bank near the gaging station at Allisonia and shows the ledges extending across the river and a few of the projecting rocks and also shows the gaging tower in the upper right hand corner.

Photograph No. 19 was taken from the right bank about ½ mile above Delton and shows the ledges extending across the river. My copy of that picture is not very clear; it looks a little hazy due to the fog. This picture was taken early in the morning and it shows the fog.

2267 Photograph No. 20 was taken from the right bank immediately above Delton and shows a series of ledges crossing the river. There is what appears to be a gap in that ledge, over across towards the right hand side of the picture. I could not say definitely whether that is a channel cut in there by the Government. It is impossible to say.

Photograph No. 21 was taken from the left bank above Delton and shows the ledges crossing the river and the ledge shown on the preceding photograph appears in this one. On this picture it appears on the far side of the upper ledge near the top of the picture.

Photograph No. 22 is a view from the right bank about 1 mile below Clark's Mill, and shows the shallow condition of the stream and our boat being carried across the shallow places—led across. Clark's Mill is just about 4 miles below Allisonia, about a mile and a half below Delton. This picture shows the river from shore to the other shore, all of the river is in the picture.

Photograph No. 23 was taken about 2 miles below Clark's Ferry and shows a large riffle and several other riffles crossing the river right angles and also shows a boat in the middle of the picture d 2 men working the boat over these ledges.

Delton is downstream from Allisonia on the opposite side of the ream and then Clark's Mill. Hiwassee is between Delton and llisonia, it is about 1 mile below Allisonia. It is difficult to give miles how far Delton is below the Hiwassee bridge. I have ot been up there for so long; probably a mile or a mile and a alf. Clark's Mill is about a mile and a half or a mile below elton.

Photograph No. 24 shows the ledges and the rocks projecting om the water and is at a point 3 miles below Clark's Ferry, ken from the right bank.

Photograph No. 25 is a view from the right bank about ¼ of a ile below Owens Ferry, showing the ledges crossing the river d some projecting rocks. I don't believe there is any channel rough that ledge observable in that picture. I don't see any.

68 Photograph No. 26 is a series of ledges crossing the river, ¾ of a mile approximately below Owens Ferry. There e several ledges extending all the way across the river.

Photograph No. 27 is a picture taken from the same point as hotograph No. 26. It shows the same ledges and also shows a p in 2 ledges. The gap is probably a part of the river improvements. It is not very deep but is sort of sunken.

Photograph No. 28 was taken from the left bank ¾ of a mile low Owens Ferry and also shows the same ledges shown in e preceding photograph No. 27.

Photograph No. 29 shows more in detail the picture of the dges taken in the last two or three photographs. In an atmpt to show, if possible, any river improvements. At this oint, we were trying to get in detail the low spot in the ledges.

Owens Ferry is shown on the map to be roughly 4 miles below lark's Ferry. Owens Ferry is the only name I know; Eanes erry possibly. I never heard it called Cox's Ferry. Max's reek comes into New River at Owens Ferry. Haw Branch is Wheeler Branch Ferry, and Owens Ferry as I recall is at the outh of Max's Creek.

In photograph No. 29 the sluice that may be the improvement mentioned is just about in the middle of the picture. That is rough the upper ledge and right about in the middle of the icture. The sluice is shown at right angles through the ledges.

Photograph No. 30 was taken from the left bank about ¼ of a ile below Wheeler Branch Ferry. Wheeler Branch Ferry is one side and Haw Branch on the other; sometimes they are lled one and sometimes the other. There is a highway bridge ere now; and the ferry has been discontinued.

Photograph No. 31 is a view across the river from the left bank showing 2 good sized ledges, ¾ of a mile below Wheeler Branch Ferry, and shows a gap through the ledge in the
2269 foreground, but I believe it is too narrow to indicate any improvement on the river; it is too narrow a gap through the ledge to be a river improvement.

Photograph No. 32 was taken from the same point as photograph No. 31 and shows the ledges of the river taken at a different angle. The gap in the ledge in the middle of the photograph is the same one shown a little to the left of the center in the preceding one.

Photograph No. 33 is a view taken from the left bank, ⅝ of a mile below Wheeler Branch Ferry and shows a series of ledges constituting the falls and the rough condition there. That is not the same part of the river shown in the two preceding photographs. I do not know what that particular falls is called.

Photograph No. 34 is a view upstream from the left bank of the river, about 1 mile above Whitt's Ferry, and shows a series of ledges in the distance and also a view of projecting rocks in the foreground.

Photograph No. 35 is a view up stream from the point in the river ½ a mile above Whitt's Ferry, showing the ledges extending across the river.

Photograph No. 36 is a series of ledges extending across the river; the picture was taken from the left bank and the point is just above Linkous' Ferry. Linkous' Ferry is, I should say 2 or 3 miles, below Whitt's Ferry. Photograph No. 36 shows a series of ledges extending across the river. It also shows the automobiles we used after we left the boat at Whitt's Ferry. That is in the left foreground.

Photograph No. 37 is a view across the river from the left bank and at a point immediately below Whitt's Ferry and shows ledges crossing the breadth of the stream. They are not the same ledges shown in photograph No. 36, these are below the ferry and the preceding photograph was above. They are probably ⅛ of a mile apart.

Photograph No. 38 is a view across the river from the left bank about ⅜ of a mile below Linkous' Ferry, and shows the ledges crossing the river and shows the gravel bars in the middle of the river. There is a low place in the ledge in the immediate foreground. It is impossible to say whether or not it was
2270 man made or nature made, from an observation of the place.

Photograph No. 39 is a view up stream from the left bank, a mile below Linkous' Ferry and shows the ledges across the stream and an island in the middle of the picture and the beginning of another island on the left-hand side of the photograph.

Photograph No. 40 is a view up stream from a high point about 1 mile below Peak Creek on the left bank, showing a series of ledges crossing the stream at approximately right angles, and also shows a series of islands extending up and down the river. That is about ¼ of a mile below Peaks Creek. The mouth of Peaks Creek is not shown in the picture.

Photograph No. 41 was taken on the left bank of Old No. 6 Site which was about four miles from the present one. It shows the rock ledges crossing the stream—not very much. There appears to be a channel in the middle of the picture, but whether or not it was man made, I don't know. We didn't go through that in a boat—we had no boat there.

Photograph No. 42 was taken from the left bank at Old No. 6 Dam Site and shows the ledges and the upper part of the island, and here too is shown something that appears to be a sluice (indicating). These two views, No. 41 and 42, are views from the left crossing from the left bank. The ledge in photograph No. 41 is not shown in photograph No. 42. The ledge in No. 42 is somewhat below No. 41. Looking at the top of the picture in 41 and No. 42 you will see a cornfield over at the edge of the stream which might identify the location better.

Photograph No. 43 is a view across the river at Ingle's Falls from the left bank, about ½ a mile above Ingle's Ferry. It shows the ledges extending across the stream and the projecting rocks and also shows the water tower of the city of Radford in the left-hand side of the picture, on top of the hill. What is shown there is generally called Ingle's Falls. All of Ingle's Falls is not in this photograph, it extends for quite a distance.

2271 Photograph No. 44 is a picture taken from about the same point but at a different angle and somewhat further away from the river than the preceding photograph. It shows the ledges and the projecting rocks. The ledges and rocks shown in picture No. 44 appear in No. 43, they do partially at least. These two pictures may be oriented by the large rock in the foreground of picture No. 43, which shows on the left side of picture No. 44, right by the trunk of the tree there, right near the water's edge.

Photograph No. 45 is a view from the left bank of Ingle's Ferry at the foot of Ingle's Falls and it shows a view of the projecting rocks and gravel bed or gravel bar, which is in the middle of the river.

Picture No. 46 was taken from the left bank at a point opposite the city of Radford, and shows a very regular ledge extending across the river and shows the Old Radford Furnace, or I think one of the furnaces at least, on the left side of the picture, and the pipe shop in the right side of the picture. That is above the highway bridge.

Photograph No. 47 is a view taken from the highway bridge crossing the bridge at the city of Radford looking downstream, showing the ledges crossing the stream at right angles.

Photograph No. 48 was taken from the left bank about ½ a mile below Walton and shows the ledges crossing the stream and also the gravel bars.

I would say Walton is about 3 miles by the river from Radford, guessing at it. I think that is pretty close—it is down-stream from the upper part of the horseshoe, that is, the arch. It is up-stream from the tunnel, the bridge and Pepper's Ferry.

Photograph No. 49 was taken from approximately the same point, and shows the ledges crossing the stream, at the same point as in the preceding photograph. It shows the ledges crossing the stream as well as the gravel bars. I believe they are the same ledges in both pictures.

Photograph No. 50 is a view across the river from the left bank, about 10 miles below and shows the shoals and the 2272 water worn boulders and the gravel. I don't know whether these are the Monkey Shoals or not. It is below Walton about 7 miles, I would say 6 or 7 miles below Walton, and 10 miles below Radford. Pictures No. 48 and 49 were taken from the same point; No. 50 was taken 10 miles down from Radford. I would say 7 miles or 6½ or 7 miles, below the point from which No. 48 and 49 were taken.

Photograph No. 51 was taken from about the same point that photograph No. 50 was taken, from the left bank about 10 miles below Radford. They are the same shoals and the same gravel bank in both pictures No. 50 and 51.

Photograph No. 52 was also taken from the same point that photograph No. 50 and photograph No. 51 were taken, and it shows the shoals and the gravel bars.

Photograph No. 53 is a view across the river from the left bank, taken from the Parrott Mining property, showing several series of ledges crossing the stream at right angles. Some of the ledges are submerged and it shows the Norfolk & Western Railroad in the foreground and the Virginian Railroad on the opposite bank. The village across the river is McCoy.

Photograph No. 54 is a view taken up stream from the left bank at the Parrott Mining property and shows the ledges extending across the river in the distance.

Photograph No. 55 is a view taken across the river from the right bank at McCoy railroad station and shows the ledges crossing the river and the projecting rocks and a few small islands and the Virginian Railroad in the foreground. The ledges on the left hand side of photograph No. 53 may be the ones shown in the photograph No. 55, it is a little indistinct.

Photograph No. 56 is a view from the left bank about ¼ of a mile above Big Falls. It shows a series of ledges crossing the stream and also shows the Norfolk & Western Railroad in the foreground and the Virginian Railroad on the opposite shore.

2273 Photograph No. 57 shows a view of Big Falls from the left bank; it shows the ledges crossing the stream at the Falls and the Norfolk & Western Railroad in the foreground and the Virginian on the opposite shore. The Falls are located on the Pulaski and Giles county line.

Photograph No. 58 is a view taken from the left bank slightly down stream from view shown in photograph No. 57. It shows the Big Falls, the same falls that were shown in No. 57.

Photograph No. 59 is a view from the right bank about ½ a mile above Goodwin's Ferry, and shows the regular ledges extending across the stream at right angles to the stream. There is the Norfolk & Western Railroad in the distance. Goodwin's Ferry is above Eggleston about 2 or 3 miles, I would say.

Photograph No. 60 is a view from the right bank, about a mile above Eggleston; it shows the ledges, the bars in the river, and some shallow places and the Norfolk & Western Railroad on the opposite bank of the river.

The witness on Cross Examination testified as follows:

I was instructed to take the photographs to show the rapids, rocks, and other obstructions in the river. I was given no particular explanation of why I was to take them. I was requested to take photographs of that portion of the river on which I did take them. No one asked me to go down the river as far as Hinton. Apparently there was some reason behind the taking of pictures which would prompt those who asked me to take them. I was their Engineer of construction. I do not recall that they gave me any reason for taking them. I was told to take the photographs.

Q. And what was the instruction that they gave you as to how you were to take them, if any?

A. All I recall is that I was told to take the photographs on a certain stretch of the river, and more particularly the exposed ledges and rapids and shoals and things of that sort.

2274 I just went out and got a photographer, and went up the river and started to photographing. I probably knew that the Appalachian Electric Power Company had filed a bill of complaint against George Otis Smith and other members of the Federal Power Commission prior to the request of me to take these pictures. I probably thought that these were being taken to be used in a law suit. I was not given the reason. I was told to take them.

The stretch over which I took pictures was much further than six or seven miles. Offhand I would say it was 50 or 60 miles, from Austinville to Eggleston, or maybe a little more.

It would be difficult to say what space down stream the faults or shoals occupied that were photographed. I took the prominent ones—the more outstanding. I did not attempt to get them all; I could not. I just took the most outstanding ones. The photographer used an 8 x 10 camera, I do not know the make, I don't believe he had a magnifying lens on the front of the camera. I have not studied the Craighill report of the number of pools and shoals in this river in the stretch that I took.

Q. You did not attempt to take pools in your pictures?

A. No, I did not.

Q. And, in taking these rocks and shoals, you took as close up as you could?

A. I showed as large detail as I could.

Q. You showed as large detail as you could?

A. Yes.

Q. I believe you stated that the flow was a low flow?

A. Yes, sir.

Q. You know that it was an exceptional low flow?

A. It was below normal flow—much below normal.

Q. Wasn't it at least one-third below low flow—below ordinary low flow?

A. Well, it probably was.

Q. Why did you select the days of the month of 1931 that you did select, namely: The 4th and 5th of November and the 24, 25th and 26th?

2275 A. It was not really left to my discretion. I was called over the telephone and asked to prepare for taking the photographs as soon as possible.

I did not watch for a time when I felt it would be the best time to get as much exposure of rocks in the river as I could. I was asked to take them the latter part of October, as I remember, and by the time I could get the photographer engaged and everything ready, it was the 4th of November. The fact that it was a real low flow at that time was a coincidence. I know that the operation of the Buck Dam was at peak loads and they carried them to get the most out of them. I did not look into the operation of the plant at all. If they were operating on a peak load, it would leave very little water in the river close by. If on the morning of November 4, 1931 the Buck Dam was closed down so that there was no flow, it would take some time for that to be felt that far down. At the time the first pictures were taken I was about 10 miles from the Buck Dam. I would not want to say what the normal flow is in that stretch of the river. When the Buck plant was closed down along that stretch of the river there would be practically no water in the stream except that which was coming in from the side streams. That would be true a part of the day but I do not know what part of the day it would be.

We had the right number of pictures we wanted in the first days, that is the 4th and 5th of November, but they were not very good as to quality. Some showed too much landscape and not enough detail of the ledges, and for that reason we took some of them over. We could have taken pictures there that would have shown the pools.

The boat I spoke of I called a punt. It is also described as a canoe. I would not say they are in the same class, I have traveled in both. They call them canoes in Virginia. It is not really a canoe. I have never seen a bateau, but I have seen photographs of them. This was a flat bottomed boat, and you could walk around in it. It was 19½ feet long, about 18 inches deep, and drew about 5 inches of water. A person could change seats and walk around from one place to the other in the
2276 boat. This is the common type of boat that is used on the river. I did not see many of these boats as I was going down the river. Different ferries usually have one or two to take foot passengers across instead of taking the big boat. Aside from that, there were very few. They use them at the Radford Dam, to carry men across—two or three of them. We have no boats down there with motors in them. Some of the fishermen run up and down the pool in boats with motors on them. It is quite a long pool, I would say possibly 3 miles. We have ferry boats the same type boat—that we used to build the Coffer Dam. We don't use them for ferry purposes. One of the boats we used there we built; the other was obtained at Radford.

I know that neither of these boats was brought down over Foster Falls nor was brought down from a distance of say eight or ten miles up the river above our project. I don't know how they got the boat up from Radford. I wasn't there. I don't know whether they hauled it up by truck. I don't know. I think that they did. I don't know whether they boated it up.

I have no idea why the company told me to go down as far as Eggleston and to start there taking pictures. I was puzzled myself, but I did not know why it was.

I would say that those pictures are representative of the river, at the time they were taken. We did not try to take the pools.

The pools could be taken. I think it would be representative of the river without the pools. It shows the nature of the river and the character of the river. Knowing there was a stretch between the photographs, there must be some pools between. I do not know whether that is an inference that probably many people would not know necessarily. A great many stretches between those ledges are not pools. They are shoals, projecting ledges and rocks. I think these pictures would be representative of the conditions of that river. It shows the rocks and a rocky and mountainous stream.

I saw indications of something that might have been Government improvement work, but I was unable to say definitely. I know that we tried to get through some with the boat, and especially the one that we took 3 or 4 pictures of at one place, and that seemed to be the most definite. The boat dragged
2277 on the rock, and it was difficult to get it through. It was
right in that area where I was told the Government had done work. We did not get out and push the boat through that one, but we had to take the poles and work it through and get the weight off the boat with the poles. The channel was too shallow for the boat to go through. There was not enough water for the boat to go through; the bottom would catch on the rocks. That was on November 5, 1931, along about noon I would say, just before noon I think. That particular spot was just below Owens Ferry about ¾ of a mile. As I could see it, and we were looking at it, it seemed the ledge was not cut deep enough through the rock. There were no channel indications at all. If there was one, it had filled up with debris. It was the rock, and the ledge itself that I was interested in.

On the trip I did not see at any time any rock that I thought had been thrown out on Government work, on that stretch of the river. I was looking for any indication for a channel, or rock cuts, or anything of that sort. I made my own observations. If I had seen any indications I would have taken pictures, but I did not see any. I would not say that there was no work done by the Government on this stretch. If there had been channels, they had probably been filled up with debris. High water probably filled them up. I have read some of the engineer's report in regard to the work done.

I was on the river there for 3 days at one time. During that time there was no noticeable variation in the flow of that stream due to the operation of the Buck and Byllesby dams. I did not see any variation. There may have been some, but it would not be noticeable. There could be a variation without it being perceptible to me as I went along. I was not measuring the stream flow.

I did not see a channel constructed there to the depth of two feet. I saw no channel. The only thing I saw which might have been an improvement was the tops of the ledges cut off in one or two places, and they were not 2½ feet deep.

Q. Do you think these channels which the engineers stated they dug were obliterated by reason of the fact they were filled up?

A. Might have been.

2278 Q. And being filled up with debris they have been obliterated?

A. Yes, sir.

On this trip down the river I had a photographer and 2 men to work the boat. They were familiar with the river, they lived on the river, that is, they had farms adjacent to the river. They did not boat up and down the river and they did not know anything about the channel of the river. None of them had been up and down the river through the channel. We had to find our way down through the ledges. Sometimes we would go back and forth from one side of the river to the other and find no channel, and in a case of that sort, the passengers would get out on the ledges and the 2 men forced the boat across. At that time there was no geological condition to upheave things so as to put a channel out of existence.

The Parrott Mines are coal mines. An anthracite deposit. It is located across the river from McCoy.

I remember that place shown in Government Exhibit No. 249, which purports to be an aerial photograph of a stretch of New River with Dublin in the distance.

Q. Do you notice certain lines drawn in the body of the river?

A. I do.

Q. Do you notice certain spots going with the flow of the river?

A. Yes, sir.

Q. Do you recognize those as channel work?

A. On our own photograph. I took our photograph from this point.

Q. Up where the trees are?

A. Yes, right up in there [indicating on picture], and while I was going over the river I could not see any indication even after I stood at that point, but after the photograph was developed and printed, one can see an indication down through there of what might have been a channel and rock thrown up along that side of the bank, but it wasn't noticeable looking down.

Q. Do you know where you went when you came down the river?

A. At this place we took the road. You can see the road parallel there.

2279 Q. You were using automobiles there?

A. Yes, sir.

Q. I call your attention to Exhibit #544 and ask you if it isn't a fact that of the sixty pictures you have there, 1 and 2 were taken from approximately the same point?

A. Yes, that is true.

Q. And 3, 4, 5 and 6 covering the same part of the river at Foster Falls?

A. That is true.

Q. And 7 and 8 at Baker's Ledge?

A. They are very close together.

Q. And 9, 10 and 11 at a point about three miles below Foster Falls?

A. Yes.

Q. And 12 and 13 at Carter's Ferry?

A. Yes.

Q. And 14 and 15 at Barren Springs?

A. That is true.

Q. All of those I have called your attention to at this time were above where the Radford pool is located on the river; is that right?

A. Yes, I believe so.

Q. And 16, 17 and 18 were all at Allisonia, were they not?

A. 16 was over a mile above Allisonia.

Q. And 17 and 18 were how close to Allisonia?

A. 17 three-quarters of a mile above Allisonia and 18 was practically at Allisonia.

Q. So they were all within an area of about a mile?

A. About a mile.

Q. 19, 20 and 21 were all at Delton, were they not?

A. Yes.

Q. And 22 and 23 were at Clark's Ferry?

A. 22 was a mile below Clark's Mill; 23 is about two miles below.

2280 Q. A mile apart?

A. Yes.

Q. And 26, 27, 28, and 29 were about together, and three-quarters of a mile below Owen's Ferry?

A. Yes, they are meant to show the same point.

Q. What is photograph 30?

A. View from left bank, one-fourth mile below Wheeler Branch Ferry.

Q. 30, 31, 32 and 33 are within an area of about a quarter of a mile or three-eights of a mile?

A. Yes, I would say so.

Q. 34 and 35 are close together too, are they not?

A. Yes, about a half mile apart.

Q. And they are close to which ferry?

A. About a mile from Whitt's Ferry.

Q. And 36 and 37?

A. Very close together.

Q. Near Linkous's Ferry?

A. Yes.

Q. 36, 37, 38 and 39 are all close together?

A. Well, yes, within probably a mile.

Q. Then 40, 41, and 42 are at the same point, are they not?

A. No, no, they are very widely separated.

Q. What is 41?

A. 41 is the view of the old #6 dam site about 4 miles above new #6.

Q. What is #42?

A. Very close to 41, practically the same location.

Q. 44 and 45 are very close together?

A. Yes, sir.

Q. And 46, 48, and 49 were taken at the same point, were they not?

A. They are taken at the same point.

Q. 50, 51 and 52 are also taken at the same point, are they not?

A. Yes.

Q. 53, 54, 55, and 56 are all taken at McCoy's Ferry, are they not, at Sifford's Falls? 1281

A. Well they are taken along a stretch of a mile or so. I would say maybe a mile and a half.

Q. How close are 57, 58 and 59 to each other?

A. 57 and 58 are taken practically at the same point, and 59 is a considerable distance downstream. I have forgotten just how far.

Q. It is a fact, is it not, that the shallows or shoals which you have taken photos of cover only seven miles out of the sixty-seven miles on the stretch which you covered by boat or cover in your photographs?

A. Yes.

Q. So the remaining sixty miles of the sixty-seven would be pools?

A. Not necessarily, no. It is impossible to take pools, the water might be only a few inches deep, and you could not show it in the picture, and many of the le'ges were so insignificant they would not show in a photograph, but there are not many what you would call pools.

Q. Wasn't it quietly flowing water in these stretches and not what you would call rapids?

A. Some places it was only a few inches deep and one stretch the ledges ran parallel to the river, and it was rough, you could not get around, you just could get through to get down the river, but could not show it in a photograph.

Q. How often have you been up to Allisonia and that part of the country?

A. A great many times.

Q. You have seen those rock, most of the rocks, covered by the water many times, have you not?

A. I have seen them covered, yes, sir.

Q. And if there was a flow down there say of three or four thousand feet, wouldn't they be covered most of the time?

A. Probably be covered, but still there would be obstructions and difficult to get anything over them.

2282 Q. The water under such conditions would be several feet deeper than when these pictures were made?

A. Deeper and more turbulent and more dangerous.

Q. Have you been informed that the U. S. Government sent a motor boat all the way up from Allisonia and back this year?

A. I have heard it rumored.

Q. You didn't know that to be a fact?

A. No.

Q. It has been testified to in court, but you didn't know about that?

A. No.

(Exhibit 249, being photograph No. 35 contained in album of aerial photographs of New River—Exhibit 273, was offered in evidence over Defendant's objection that said exhibit had not been properly proved.)

T. A. Patton on Direct Examination testified as follows:

I live at Roncefort, West Virginia. I am a photographer. I have been a photographer since 1884. I was a photographer in September, 1930. I recall taking some pictures on the New River during that month of September. I took the photographs No. 114 to 127 inclusive, contained in Defendant's Exhibit 555, which exhibit also contains a map showing the location of photographs 114 to 127 inclusive. I took these pictures on September 29, 1930.

Q. Do those photographs fairly portray what is shown in them as to the time and place at which they were taken, as indicated at the bottom of the photograph?

A. Yes, sir.

By Mr. Abbot. If Your Honor please, we offer Defendant's Exhibit 555 in evidence. This location map is offered simply with reference to the location of the different photographs and not as any evidence of State or County lines or anything of that kind.

(Said album containing 14 photographs of views on New River om Wiley's Falls to Mouth of Greenbrier River, Nos. 114 to 7, inclusive, and the location map, is here filed and is marked "Defendant's Exhibit 555.")

33 The witness on Cross Examination testified as follows:

I was not given any instruction when I took these pic- es. I went with an engineer employed by the Appalachian ectric Power Company to make these pictures. The engineer s Mr. Rader. He gave no instructions at all except just to take tures that he pointed out. He went along with me. The first ture shows the entire width of the river. It is an up-view of it, t it takes a full view.

(It was agreed by counsel for the plaintiff that photograph No. 1 in Defendant's Exhibit 555 was the same photograph which fendant offered and had marked for identification as "Exhibit .")

On the left-hand side of the picture there appears to be a body water that disappears behind some trees. There is no island re as I know of, I don't think so, I did not notice any. It is t back water. That is looking up stream. It is over on the ge of the stream and there might be an eddy there, I don't ow, I couldn't say just what that water is there. I don't remem- seeing any island there. I used an Eastmans 8 x 10 camera. lid not have any enlarging lens on the front, it was just a regu- Eastman kodak lens. I took this picture from the bank of the er. There is no island in picture 115, in the background. I ld not describe those pictures no more than to say I made them der orders. All I did was to do the camera work. I paid no ention to anything else except just the operation of the camera.

Q. Was the river very low at that time?

A. It wasn't very high.

Q. Would you say it was low?

A. Yes, sir, it was low.

Q. You don't know just exactly how low?

A. No, sir.

Q. Wouldn't this indicate on picture 115, that it was extremely v?

A. That was the first trip I took up the river, I am not familiar with the river, and I didn't pay any attention to that.

34 I did not know any places that I was going to up the river. I know nothing about this matter except that I took some pictures, I can vouch for the pictures, and that is all.

35 (Exhibit 556, being the Annual Report of the President and Directors of the Board of Public Words to the Gen- l Assembly of Virginia in pursuance of an Act entitled "An

Act creating a fund for internal improvements" was offered in evidence.)

(Exhibits 558A–G, inclusive, being a map—in 7 sheets—accompanying F. W. Alstaetter's report of November 21, 1912, bearing legend, "New River from Hinton, West Virginia, to Radford, Virginia, compiled under direction of Major F. W. Alstaetter, Corps of Engineers, U. S. A. from surveys by Engineering Department in 1872 and by United States Geological Survey in 1884–5–6 & 7" were offered in evidence—Exhibit 558G being the same as Exhibit 527 marked for identification.)

(Exhibit 559, being pp. 95, 133–139, inclusive, of Report of the Chief of Engineers, for 1875, was offered in evidence.)

(Exhibit 528, being the full and complete report from Major Craighill, U. S. Engineer's Office, Baltimore, Md., dated April 17, 1891, to Chief of Engineers, T. L. Casey—said report contains in particular the paragraph of Major Craighill's report which was omitted from Exhibit 43 as originally offered by plaintiff—together with Chief of Engineer's endorsement dated April 21 1891, was offered in evidence.)

(Exhibit 560, being pp. 251–253 and 1925–1929, inclusive, of the Report of the Chief of Engineers for the year 1887, relating to New River, was offered in evidence.).

(Exhibit 561, being pp. 225, 226, 1760, 1761 of the Report of the Chief of Engineers for the year 1888, was offered in evidence.)

(Exhibit 562, being pp. 261, 262, 1961, 1962 of the Report of the Chief of Engineers for the year 1889, was offered in evidence.)

(Exhibit 563, being pp. 235, 236, 2249–51, inclusive, of the Report of the Chief of Engineers for the year 1890, was offered in evidence.)

(Exhibit 564, being report of Brig. Gen. Casey, Chief of Engineers, U. S. Army, to the Secretary of War, dated November 16, 1894, to which is attached a third endorsement by Colonel Craighill, and also a second endorsement, was offered in evidence.)

(Exhibit 565, being a letter from the Secretary of War, dated December 16, 1903, transmitting with a report from the Chief of Engineers, dated December 1, 1903, a report on the Examination of New River, West Va., by Captain W. E. Craighill, dated February 4, 1903, was offered in evidence.)

(Exhibit 566, being a memorandum to the Secretary of War by General Black, Chief of Engineers, dated May 19, 1916, on "Pollution of the Waters of New River and its effluent, the Kanawha River, by the flowing of ore washings from the mines and furnaces located on the former river and its tributaries" was offered in evidence.)

(Exhibit 567, being page 1284 of the report of the Chief of Engineers, year 1917, was offered in evidence.)

2286 **RUFUS W. PUTNAM**

Direct Examination By Mr. JACKSON:

Q. Please state your full name and residence for the record?

A. Rufus W. Putnam; Riverside, Illinois.

Q. And that is a suburb of Chicago?

A. That is a suburb of Chicago.

Q. What is your present occupation?

A. I am a consulting engineer.

Q. And where is your office?

A. My office is located in Chicago, 20 North Wacker Drive.

Q. Where were you educated?

A. I was educated in high school, and later at United States Military Academy, West Point, graduating from there number nine in my class into the Corps of Engineers.

By Mr. THOMPSON:

Q. What year?

A. 1913.

Subsequently I attended the Army Engineers School at Washington Barracks, D. C., from the Fall of 1914 to late Spring or early Summer of 1916.

By Mr. JACKSON:

Q. You say you were commissioned in the Engineers Corps after graduation from West Point?

A. Yes; I was.

Q. What was the character of the studies you pursued at the Army Engineers School, Washington Barracks?

A. The course consisted of approximately 50 percent river and harbor engineering, and the balance of the course was devoted to mechanical and electrical and other phases of civil and military engineering.

Q. Did your work in the Army Engineers School, so far as related to river and harbor navigation, involve field inspection and work of that character?

2287 A. These courses did. I recall particularly two field inspection trips where river and harbor improvements were going on. One was over the Monongahela River and the other over the Ohio River.

Q. Major, will you please state generally what has been your experience in the practice of your profession since your graduation from West Point?

A. After graduating from the United States Military Academy, I served, except for the period previously described in the Army Engineers School, almost entirely with troops both in the United States and in France until June 1921. At that time I was assigned to duty in Chicago as Assistant to the United States District Engineer, which position I held for a year, and then was appointed U. S. District Engineer for the Chicago District.

Q. What waterways in general were under the jurisdiction of the United States Engineering Office for the Chicago District?

A. At that time the Chicago District included the harbors on Lack Michigan from Waukegan, Illinois, in the north, and, taking them in order, from there on around, the harbor of Chicago, South Chicago, Indiana harbor, supervision over the private harbors of Buffington and Gary and the public harbor at Michigan, Indiana; the Chicago and Calumet Rivers and their branches, the Indiana Harbor Ship Canal, what is known as Trail Creek at Michigan City, Indiana, the Chicago Drainage Canal, Calumet Sag Canal, the Illinois River from the head of the Federal Improvements near LaSalle, Illinois, about 100 miles out of Chicago, to the mouth of the Illinois River where it joins the Mississippi at Grafton.

Q. How long were you in charge of the Chicago District?

A. Four years.

Q. During that tour of duty, in charge of the United States Engineering Office of the Chicago District, did your duties involve studies of reports upon the condition of improvement of any of the rivers or streams in that district?

2288 A. These did include several streams and harbors in the district. The principal one had to do with the further improvement of the Illinois River to tie in with the improvement being undertaken by the State of Illinois between the head of the Federal improvement and the Chicago Drainage Canal.

Q. Did this study and report on the Illinois River involve any consideration of traffic possibilities?

A. It did. My office was asked to make recommendations with regard to the future improvement of this stream, and it appeared that the expenditure of a considerable sum of money would be involved, so that, in order to determine whether this improvement was justified, or not, it was necessary to make a very complete traffic survey.

We examined the methods of water transportation on the Illinois River and Mississippi and elsewhere in the United States, and determined what traffic might be available to the waterway, and from that we were able to consider the possible saving to the public by reason of any proposed method of improvement.

Q. Was your report on the Illinois River ever published?

A. It was subsequently published as a part of House Document No. 4, 69th Congress, First Session.

Q. Major, during your tour of duty in charge of the United States District Engineers' Office at Chicago, did you have occasion to study and consider the effect of large variations of flow and diversion of water from Lake Michigan through the Illinois waterway into Illinois River?

A. I did.

Q. Did that study involve substantial changes in the amount of flow or otherwise?

A. It involved substantial changes in the water of perhaps two to six thousand second-feet.

2289 Q. Now, will you please continue the statement of your professional experience after you finished your tour of duty in charge of the United States Engineering Office for the Chicago District?

A. When I finished that assignment, I had been assigned as United States District Engineer at Honolulu, and, at the same time, I had been requested by the Commercial Club of Chicago to make a study and report on the requirements of the Chicago Metropolitan District in the way of harbor and waterway improvements, and, as the result of this request on the part of the Commercial Club, I resigned from the service of the United States Army and undertook this work.

Q. That was when?

A. This was in 1926.

Q. Now, what did you do first after you entered upon that work?

A. I first went to Europe and spent some time there in the study of harbor and waterway improvements and traffic arrangements, including among the waterways the Seine and Rome Rivers in France; the Elbe and Rhone Rivers; and the Thames, I believe, in England.

After that I returned to the United States and spent some more time studying harbor and waterway improvements along the Atlantic Coast and the Gulf Coast, as well as along the Great Lakes, including inspection trips on the Mississippi River from Cairo to New Orleans, and one on the New York State Barge Canal between Oswego and Albany.

That particular work for the Commercial Club was completed in 1927, and, at that time, I had already begun to practice as a Consulting Engineer on river and harbor works.

Since then I have handled some 60 different projects in various parts of the country.

Q. Do you mean river and harbor projects?

A. River and harbor projects. Among these I might mention specifically the design and supervision of construction of the harbor and terminal for a stone company near Manistique, Michigan; harbor and waterway improvements near the
2290 mouth of the Rio Grande River in South Texas; some work

on the Houston Ship Canal, studies of the Ohio and upper Mississippi River with regard to the development of water transportation operations; a study for the same purpose, about the year 1930, of the Kanawha River, and, in addition to that, various projects which included the development of harbors and terminals at various locations.

Q. Have you, in recent years, had any connection with any company engaged in the navigation business?

A. I have. Since 1928 I have been an officer and stockholder in a navigation company which has been engaged in the transportation of bulk commodities on the Chicago Drainage Canal, Chicago River, Calumet River, and the harbors in the southern end of Lake Michigan.

During one season we operated a fleet of barges on the Illinois River, bringing coal into Chicago from a point about 200 miles south.

I have devoted about 25 percent of my time since 1928 to the affairs of that company.

Q. Have you had any other connection with the active management of navigation operations?

A. I have. In 1930 I was in active charge of an operation involving the transportation of coal by barges on the lower end of the Green River to Evansville, Indiana.

Q. Are you a member of any professional society?

A. A member of the American Society of Civil Engineers, the Society of American Military Engineers, and I am a past president of the Western Society of Engineers.

Q. Have you written any technical papers dealing with navigation problems?

A. I have written quite a few on this subject, one of which received the Wellington award of the American Society of Civil Engineers.

By Mr. **Thompson**:

Q. When you say "this subject," what subject?

2291 A. Water transportation.

By Mr. **Jackson**:

Q. Major, have you made any special study on the New and Kanawha Rivers?

A. I have made a special study on the New and Kanawha Rivers.

Q. In the course of that study, have you made any study of the reports, maps, and records of the United States Army Engineers dealing with the New River and the Kanawha River?

A. I have.

Q. Will you please state briefly what records, maps, and reports of the United States Army Engineers you have in general examined in the course of your study of the New River and the Kanawha River?

Mr. Thompson. May I ask the witness what he is reading from?

A. I am reading from notes I have prepared. For instance, right here I have a complete list of the various documents I have examined. There are so many, I couldn't possibly remember them all.

Mr. Thompson. All right.

A. I am not sure I understood that question, Mr. Jackson. Reports of Government Engineers?

Q. Any reports or maps of Government Engineers you have studied in your special study of the New and Kanawha Rivers—Government Engineers or early engineering surveys?

A. I studied the following in that connection: The Moore & Briggs Survey of 1819; Report of the Commission headed by Chief Justice Marshall in 1812: Map accompanying John Marshall Report, entitled A Survey of the Headwaters of the James River and the Greenbrier and Jackson Rivers and the great Kanawha or New River, and the high road between them; Annual Reports of the Chief of Engineers from 1873 to 1891, inclusive, which include the reports of the Chief of Engineers, the District Engineer and his local subordinates dealing with New River; photostats of originals of 35 maps, purporting
292 to be a part of the New River surveys made by Government Engineers between 1872 and 1878.

Q. Is that the map offered by the Government as Exhibit 190, do you know?

A. That is what I understand. Also various profiles of New River accompanying these reports. I have examined later reports of the Chief of Engineers and also the extracts from the River and Harbor Act of June 13, 1902, with reference to the discontinuance of the New River project.

The report of Major F. W. Alstaetter, District Engineer in 1912, with reference to the improvement from Radford to Hinton. That is known as House Document No. 1410, 62nd Congress, Third Session.

In regard to these foregoing reports, I have examined the reports of the Review Officers, including those of the Chief of Engineers and the Secretary of War.

I have examined Executive Document, House of Representatives, No. 110, 41st Congress, Third Session, containing reports of the Secretary of War, Chief of Engineers, and Major Craighill, covering a survey conducted in 1870 and 1871 on the James River and Kanawha Canal.

Also the Annual Report of the Chief of Engineers for the year 1873, containing a report of an additional survey of the James River and the Kanawha Canal.

A report of the Special Board of United States Engineers on the James River and Kanawha Canal, in 1874.

An extract from the Annual Report of Chief of Engineers, 1875, concerning additional surveys on the James River and Kanawha Canal.

Also what is known as the 308 Report on the Kanawha River and its tributaries, known as House Document 91, 74th Congress, First Session.

Also House Document No. 190, 70th Congress, First Session, being a report by Major Ardery and his reviewing officers on the improvement of the Kanawha River.

2293 Also House Document No. 31, 73rd Congress, First Session, being a report by Major Herman and his reviewing officers on improvement of Kanawha River.

Q. Major, do the reports of the District Engineer and his subordinates, or at least some of them, during the period 1873-1891, and the report of Major Alstaetter, 1912, refer to certain maps not published with the reports?

A. They do.

Q. Did you examine those unpublished maps?

A. I have, so far as they have been made available to me, and I understand all obtainable maps have been made available.

Q. In particular, have you examined the unpublished map and profiles which accompanied Major Alstaetter's Report of 1912?

A. I have examined those.

Q. Have you examined the maps of United States Geological Survey covering New and Kanawha Rivers?

A. I have.

Q. Will you state particularly whether you studied and examined the reports of the Mile-by-Mile Survey of the 128 mile stretch of New River extending from the Lead Mines to the mouth of Greenbrier, as set forth in the report of Major Craighill, and in the attached report accompanying it of N. H. Putnam, both appearing in the annual report of the Chief of Engineers 1873?

A. I have.

Q. Will you also please state in particular whether you examined the report of the mile-by-mile survey of New River from the mouth of Wilson Creek to the Lead Mines, as it appears in Report of Major Craighill, and the separate reports of his subordinates Capt. Cuyler and Mr. Scott, all appearing in the report of the Chief of Engineers 1879?

A. I have examined all.

2294 Q. Please state in particular whether you examined the Mile-by-Mile Survey contained in the Moore & Briggs Report of 1819?

A. I examined that also.

Q. Have you personally inspected or examined the New and Kanawha Rivers?

A. I have.

Q. Will you please state generally the nature and extent of your examination of the New and Kanawha Rivers?

A. About the year 1930, on behalf of the navigation company in which I was and still am interested, I made an examination of the Kanawha River with a view to the possibility of transporting coal from that district by water to St. Louis. That examination had to do with the navigation facilities existing on the stream at that time, including some of the coal loading facilities.

More recently I made an inspection of the New River between points on each of its forks in North Carolina to its mouth, and of the Kanawha River from the junction of the New and Gauley Rivers to its mouth, and included that section of the Ohio River between the mouth of the Kanawha and the lock and dam now under construction at Gallipolis.

This inspection was made by automobile, but at many points I found it desirable to get out and make closer inspections on foot.

Q. Major, will you please describe the physical characteristics of New River as you found them from your study of the early engineering reports, the Mile-by-Mile Survey, and your personal inspection of the river?

A. New River is a stream of comparatively steep slopes, flowing down between stable banks in general, which are fairly steep and high in most places.

There are not many places along New River where you will find bottom lands over which the river can spread out in times of flood.

There seems to be some difference in the characteristics as far as the banks and uplands are concerned, in the upper section as compared with the lower, having in mind that from, 2295 perhaps, in the neighborhood of McCoy or opposite Parrott's Mine these characteristics change.

Up-stream of that location we find the river flowing in general between uplands which do not extend to comparatively great heights, and the presence of more bottom lands in that section than further on down.

Below McCoy, the river begins to assume gorge characteristics, the banks are more steep and rise in many cases directly into mountains. There are fewer bottom lands, and while there are stretches where the characteristics described for the upper section seem to apply, in general more and more the river assumes the characteristics of a stream flowing through a gorge, and below Hinton, down to the mouth of the river, the gorge characteristics are almost continuous.

Q. What is the character of the bed of the stream?

A. The bed of the stream in general is rocky, composed of either ledge rock in place, or in some places shoals and gravel and boulders and fixed rocks.

Q. What is the relation of the flow of the stream to the Allegheny Mountains?

A. Below the point I mentioned a little while ago, below McCoy, where the characteristics begin to change a bit, at that location is where the river begins to cut through the Alleghany Mountains towards its mouth.

Q. At low water, what are the characteristics of the stream with reference to the condition of pools and the like?

A. The river at low water seems to be a succession of short pools, interrupted at irregular and frequent intervals by ledges and rocks, boulders and other similar obstructions.

Q. Major Putnam, please state whether or not, in your opinion, New River, in its natural and ordinary condition, was susceptible of practical use by boats carrying any substantial cargo, trade or commerce?

Objection. Sustained.

By Mr. **Jackson**:

Q. Please state whether, in your opinion, New River, in its natural and ordinary condition, was susceptible of use by boats?

Mr. **Thompson**. I object to that. That calls for the conclusion of the witness also.

The **Court**. There is a great deal of latitude as to the use of boats.

Mr. **Thompson**. Didn't we put that same question to Mr. McWhorter and it was refused?

Mr. **Jackson**. We will settle it by asking this question.

Q. (By Mr. Jackson.) Major Putnam, will you please state whether or not in your opinion, New River, in its natural condition, was susceptible of navigation?

Mr. **Thompson**. I object to that.

Mr. **Jackson**. That happened to be the form of question which Col. Watkins was permitted to answer over my objection at page 2616 of the record.

Mr. **Thompson**. Please read it.

Mr. JACKSON (reading): "Mr. Watkins, will you state whether or not, in your opinion, New River is susceptible of navigation in its natural state?" I said "We object to that question because it calls for a conclusion," and the Court overruled the objection and the defendant by counsel excepted for the reasons stated.

I would like to have an exception noted on the record to the sustaining of the objections to the questions which I have heretofore asked.

The COURT. If I admitted the question in that form before, he can answer it.

By Mr. JACKSON:

2296 Q. Will you state whether or not in your opinion New River was susceptible of navigation in its natural state?

A. In my opinion it was not.

Q. Will you please state the reasons for your opinion?

A. In my opinion, as shown by the Mile-by-Mile Surveys, New River was a succession of comparatively short pools, interrupted by rapids and shoals and falls. These rapids, shoals, and falls were composed of ledges, fixed rocks, loose boulders and gravel beds, and were of such a nature and so frequent that in my opinion the river could not have been navigable. The surveys show that in some locations chutes existed, through which the main flow of the river proceeded, but the——

The COURT (interposing). Let me interrupt you. Were those chutes artificially created?

A. No, sir. I am talking about the natural passage for the main flow of the stream before the artificial creation.

The COURT. I thought he meant the present condition.

Mr. JACKSON. I intended to ask about the present condition later.

WITNESS. Where these natural chutes existed, the course in general was tortuous and of such nature as to make navigation not only difficult but hazardous. The same conditions were possibly even more serious as to obstacles, and hazards, in my opinion, even when the river was at higher stages than might have prevailed during the time when these Mile-by-Mile Surveys were made.

This, in my opinion, is due to the fact that, with increased stages, the velocity of the stream increases to a certain extent; some of the exposed obstructions to navigation become wholly or partially concealed, and the combination of those circumstances (that is increased current velocity), with partially or completely submerged obstacles, would make the navigation of the sections where these conditions exist equally, if not more, difficult than at lower stages.

2297 Another point I have in mind in reaching this conclusion is that in some places, which is characteristic of streams of this character, the main flow of the water hugs the outside of the bend and in some situations we find along the outside of the bends rocky cliffs against which it would be rather serious for boats to strike.

Furthermore, as the result of the Mile-by-Mile Surveys, the War Department Engineers made reports to Congress stating that in order to attempt to make certain sections of the river susceptible to use by boats, it would be necessary to spend what was then a substantial sum of money with the idea of providing a channel of the least depth of two feet through a great many critical locations.

Q. In your opinion could small boats have moved about the pools in the river?

A. Oh yes, they could have in several places, and I would say that they could get, in occasional instances, from one pool to another, but based on the facts as drawn out by the mile by mile surveys, which I have referred to, such cases could not have been continuous, or regular, but quite to the contrary, and certainly in my estimation accompanied by a considerable degree of hazard.

Q. Now, Major Putnam, will you state whether or not, in your opinion, New River, in its present state, is susceptible of navigation?

By Mr. Thompson. I object to that question as calling for a conclusion. He has not been on the river, or at least hasn't so stated, to know whether there is navigation on there. It seems to me the question calls for a conclusion.

By the Court. I think it is the form of question I permitted before—it apparently is.

By Mr. Thompson. Exception.

A. In my opinion New River is not susceptible of navigation in its present state. This is based on the fact that my examination of the river itself, and the more recent reports of the officers having to do with reporting on the New River for the purpose of navigation——[interrupted].

2298 By Mr. Thompson. What reports—you said more recent reports? What dates?

By the Witness. I think up to the neighborhood of 1925, as I recall.

A. (Continuing) That the changes which have occurred since the early mile by mile surveys were made have been insufficient to have any material effect upon either improving the conditions as to navigability or upon the question of making conditions more adverse.

Q. Major Putnam, in your opinion, would it be economically practical to develop and improve New River artificially, so as to provide a useful channel for three foot navigation?

A. It would not be.

Q. Will you give the reason for your answer?

By Mr. **Thompson**. We except to all this line of testimony.

By Mr. **Jackson**. I think it is perhaps irrelevant, but it meets what you offered, and what was admitted over my objection as to its relevancy.

A. In the first place I do not believe that three foot navigation as such could in itself compete with other methods of transportation available to the territory at the present time; and over and above that, I do not see from my examination of the territory, and of the possible commerce that might be available to such an improvement, that there would be enough commerce likely to make use of such a route to justify any expenditures involved.

Q. As a matter of engineering, state whether the improvement of New River so as to provide three foot navigation would require the construction of locks and dams?

A. Assuming that three foot navigation meant three feet below extreme low water, such improvement would, in my judgment, require the use of locks and dams at certain critical locations.

Q. Would it be possible, in your judgment, to improve New River so as to provide nine foot navigation?

A. I think it would be possible.

Q. In your opinion, what would be the approximate cost of improving New River so as to provide nine foot navigation?

A. From the mouth of the New River to the mouth of Wilson Creek, a rough estimate of cost for a nine foot channel would be in excess of two hundred million dollars. 2299

Q. That would be a slack water system?

A. That would necessarily be a slack water system.

Q. In your opinion would the improvement of New River to provide nine foot navigation be economically feasible?

A. It would not.

Q. Will you state briefly the basis of your opinion?

A. As I see it, the mere annual carrying cost alone of the investment required, plus such maintenance cost as would be involved in keeping up the structures and plus operating costs at the locks and dams, would amount to a sum well in excess of what any anticipated savings through the use of the river by navigation could be.

2300 Q. In a Government project like the one for the improvement of the Kanawha River, or rather by dams and slack water pools, from what elevation is the project depth in the upper end of the pool measured and maintained?

A. It is measured and maintained below the elevation corresponding to a level pool.

Q. Major Putnam, referring to the conditions at or in the neighborhood of mile 90.5 on the Kanawha River, which the evidence shows to be the head of navigation of Government project in the London pool, at what discharge of the stream would the velocity of current become so great as to affect navigation adversely?

A. I would say it would be between 20,000 and 25,000 cubic feet per second, depending upon the elevation of that particular pool.

Q. In your opinion what, if any, difference would the rate at which the stage or discharge increased from some lesser amount up to this maximum discharge make?

A. It makes no difference to navigation what the rate is, as long as this maximum is not exceeded.

Q. Referring again to the portion of the London pool downstream from the official head of navigation project at mile 90.5 on the Kanawha River, would there be any adverse effect on navigation if there were a decrease in inflow at a rate not exceeding 2,000 second feet per hour, providing the inflow did not become less than that necessary to keep the London pool substantially at the minimum project elevation?

A. There would be no adverse effect on navigation.

Q. Major Putnam, in your opinion what, if any, adverse effect on navigation would result from an increase in stage at the head of the Marmet pool, at a rate not exceeding 1½ feet per hour?

2301 A. There would be no adverse effect upon navigation if the rate of increase in stage did not exceed 1½ feet per hour up to a point where a critical discharge of 22,000 second feet or more obtained, at which point it is possible current velocities would be such as to begin to interfere with navigation.

Q. Would that effect depend upon the rate of increase to that flow or upon the existence of the flow regardless of the rate?

A. It is the existence of the flow entirely.

Q. Please state, in your opinion, what if any adverse effect on navigation would result from an increase in stream flow at the head of the Marmet pool at a rate not exceeding 6,000 second feet per hour?

Q. Major, in your opinion, what if any effect upon navigation would result from an increase in stream flow at the head of the Marmet pool at a rate not exceeding 6,000 second feet per hour?

A. There would be two effects under these conditions; one would have to do with the possible reaching of a critical velocity which would be reached in the vicinity of 22,000 cubic feet per second, and the other would have to do with an increase in stage at the loading terminals where the relationship of the barge to the loading tipple would change as the stage increased.

Q. Would there be any adverse effect on navigation in your opinion?

A. There would be no adverse effect on navigation as long as this 6,000 second foot increase in stream flow did not produce a total in excess of the neighborhood of 22,000 second feet.

Q. And would any adverse effect at 22,000 feet depend——[interrupted].

Q. Would any adverse effect you have mentioned at 22,000
second feet depend upon the rate of increase in inflow or
2302 upon any other circumstances?

A. It would depend solely upon the current velocity as produced and not upon the rate of increase.

Q. Major Putnam, in your opinion what, if any, effect upon navigation in the Marmet pool would result from a decrease in stage at the head of the Marmet pool for not more than two hours at a rate not exceeding 1½ feet per hour.

A. The rate of change in stage would have no effect on navigation, adverse or otherwise, except the necessary adjustments to lines and spars where boats are tied up at the terminals, so long as this rate did not continue to a point where the pool was no longer maintained at its project elevation.

Q. Can you explain more fully what you mean by the last statement?

A. By that I mean this rate of decrease should not go on to a point where the flow remaining would be less than that necessary to take care of lockage, leakage and evaporation, and the draft through the power house.

There is another qualification I would like to make on that, and that is this is subject to the condition the roller gates are closed, and also subject to the qualification that I would assume under the conditions as I described them, that boats were not loaded beyond the drafts coming within the project depths, and furthermore, that barges were inside the limits of the channel, wherever it might be, of project depth.

Q. Now, Major Putnam, in your opinion what, if any, effect upon navigation in the Marmet pool would result from a decrease in stage at the head of the Marmet pool for not more than two hours at a rate not exceeding 6,000 second feet per hour?

A. The same limitation——[interrupted].

A. The same limitation would apply, and I believe I could very well clear up the point right here, and that is this, that as far as rate of increase or decrease is concerned, or as far

as the rate of increase is concerned, there is only one
2303 limitation, and that is when the current velocities of the
stream become obstructive. The rate of decrease and the total decrease is limited at the lower end by the maintenance of pool levels.

Q. Major, in the case of the Marmet pool, what if any effect upon navigation would result from variations in flow in the amount of 2,500 second feet upward and downward from the prevailing average flow?

A. You mean the average flow at the particular time?

Q. That is right.

A. There would be no material effect one way or the other as far as the variation in flow in the amount of 2,500 second feet is concerned, as long as the pool level is maintained. [Interrupted.]

A. (Continuing.) I will modify that to state that as long as pool levels are not below those required by the project. If, for instance, the discharge of the stream at any particular time is comparatively low a reduction or increase of 2,500 second feet will not be material. If the discharge gets high enough so we are approaching one of the critical discharges I described the percentage by which the velocity of flow is either increased or decreased is comparatively small, as for instance we have a total discharge in the stream of around 22,000 second feet, an increase or reduction of 2,500 second feet is in the order of change of 10% in the current velocity on the average. If you get still higher velocities the percentage of change is less and from the point of view of navigation is imperceptible.

By Mr. Jackson:

Q. Major, in your opinion, what, if any, effect upon navigation would result from increase in stage at the head of Winfield pool at a rate not exceeding two feet per hour?

2304 A. The rate would have no effect until the discharge had
reached 30,000 second feet. At that point, or in the vicinity of that discharge, the current velocities begin to become what I would term obstructive.

Q. In your opinion is that condition dependent upon rate of increase by which 30,000 second feet flow would be obtained?

A. No, sir, the rate has nothing to do with it. It is the total flow that produces current velocity.

Q. Major, assuming the maximum discharge, not exceeding 30,000 second feet, what, if any, effect upon navigation would result from an increase in stream flow at the head of Winfield pool at a rate not exceeding 6,000 second feet per hour?

A. As long as the maximum discharge did not exceed 30,000 second feet, the rate of increase is immaterial.

Q. In your opinion, what, if any effect upon navigation, would result from a decrease in stage at the head of Winfield pool for not more than two hours at a rate not exceeding two feet per hour?

A. There again we have the same condition as to the necessity of limiting reductions to a point where the pool is maintained at project elevation.

Q. What does that require?

A. That requires enough flow coming into the pool to take care of lockage, leakage and evaporation and draft at the proposed power plant, and as long as that is taken care of and as long, as I said in the other case, boats are not overloaded and keep within channel the rate of reduction has no material effect one way or the other on navigation.

Q. In the case of Winfield pool, what, if any, effect upon navigation would result from variations in flow to an amount of 2,500 second feet upward and downward from the prevailing average flow?

A. The effect on navigation of a variation of 2,500 second feet
between the upper and lower limits I have referred
2305 to previously, one the critical velocity and the other
maintenance of pool level, a variation of 2,500 second feet
will have no material effect on navigation. As I illustrated before, when the discharge is high the percentage of change in current velocity is relatively low, so it is not appreciable. If the discharge is low, the discharge itself does not produce current velocities having any substantial effect on navigation.

By the COURT:

Q. Are you stating that as a general proposition or does it apply to the Winfield pool?

A. That will apply to any pool ordinarily on the Kanawha River.

Q. Are you applying that statement only to the Kanawha River, and to the particular physical characteristics there?

A. Yes.

Q. It would not be true if you had a very narrow channel something in the form of a canal, which would increase the flow and might have a considerable difference.

A. Yes, if you produce destructive cross-currents and things of that character..

Q. It would increase the level, wouldn't it?

A. Yes, sir.

Q. You made a statement and I was wondering if you meant it to be a general statement or to apply to the physical characteristics there present on the Kanawha?

A. The latter is true because I have examined the cross-section of the stream and applied it accordingly.

By Mr. JACKSON:

Q. Am I right in understanding that you impose a lower limitation, as to how far the low flow may be reduced?

A. Yes, sir; I impose that same limitation, that is, maintenance of pool level, allowing for lockage, leakage, evaporation and same restrictions as to the loading of boats, and their location within the channel.

2306 Q. In your opinion, what effect, if any, upon navigation would result from increase in stage at the head of Gallipolis pool at a rate not exceeding 1½ feet per hour?

A. The rate itself has no material effect one way or other on navigation. It is only material when the increase continues to a point where the discharge exceeds 22,000 second feet, when we get resultant current velocities which might adversely affect navigation.

Q. Is that figure based upon your consideration of the physical characteristics of the Gallipolis pool?

A. It is.

Q. And was that true of the similar figures you gave for London, Marmet, and Winfield?

A. That is true for the other pools.

Q. In your opinion, what, if any, effect upon navigation would result from increase in stream flow at the head of Gallipolis pool at a rate not exceeding 7,000 second feet per hour?

A. The answer I gave to a previous question with reference to change in rate of flow would apply here, in other words, the rate is immaterial, it is a question entirely of reaching a critical stream flow velocity.

Q. Major, in your opinion, what, if any, effect upon navigation of the Gallipolis pool would result from a decrease in stage at the head of Gallipolis pool for not more than two hours at a rate not exceeding 1½ feet per hour?

A. Under those conditions, in my opinion, the same restrictions must be applied as in the case of the other pools. This rate of decrease in flow, in itself, is not particularly material, it is only when the flow gets below a certain total, which should be enough to take care of maintaining the pool at project level and allow for loss by lockage, leakage and evaporation, and the same 2307 restrictions I previously applied as to the loading of boats and their location in the channel would apply in this case.

Q. Instead of assuming the figures in stage, at the head of Gallipolis pool, for not more than two hours at a rate not to exceed 1½ feet an hour, assume figures in discharge at the head of Gallipolis pool for not more than two hours at a rate not exceeding 7,000 second feet per hour, what, if any, effect upon navigation would result?

By the COURT. What do you mean by 7,000 second feet per hour?

By Mr. JACKSON. If the flow at the Gallipolis pool was 20,000 second feet at noon, and later at one it was 13,000 second feet there would be a decrease of 7,000 second feet in the hour.

A. The answer I just gave with reference to change in stage at that particular location would apply in reference to figures in discharge at the rate given in view of the relationship existing between the decrease in stage and decrease in total discharge.

Q. Major, in the case of the Gallipolis pool, what, if any effect upon navigation would result from variation in flow into that pool in the amount of 2,500 second feet upward and downward from the prevailing average flow?

A. There again in view of the conditions of the channel and the critical cross section, a variation of 2,500 second feet, upward and downward, from any given stage, above that required to maintain project pool elevation; making allowances for the usual losses, any such variation would not have a material effect on navigation in that pool.

Q. What, if any, practical effect would an increase in stage, at a rate not to exceed two feet per hour, with a total rise in stage, not exceeding 5 feet, have upon the mooring, loading and unloading of barges or other vessels in harbors or at terminals along the Kanawha River?

A. I understand there is a total limitation or another limit placed on the total amount of change and that is placed at 5 feet. That being the case, the only effect on navigation under those conditions would be that the barge men would have to keep their eyes open more actively so that on a decreasing stage their 2308 lines would not part, and on a rising stage they could take in their lines, and whichever direction the stage was going they could properly adjust any spars they used for keeping their barges off the banks.

Q. You referred to rising and falling stages. I think I only asked about rising stages. Is your answer applicable to either rising or falling stages at the rate of 2 feet per hour with a maximum change of 5 feet.

A. Yes, it is.

Q. What is the present annual amount of commerce on the Kanawha River?

By Mr. **Jackson**:

Q. Have you investigated such records as are available as to the amount of commerce on the Kanawha River?

A. Yes, such as are included in the list I have.

A. The annual commerce on the Kanawha River, based on the reports I have examined, is in the neighborhood of 2,000,000 tons a year.

By Mr. **Jackson**:

Q. Assuming the Winfield and Gallipolis dams to have been placed in operation and assuming the present conditions of commerce on the Kanawha River, what would be the effect, if any, upon navigation, in the pools in the Kanawha River, if the flow into the London pool were to be reduced for a prolonged period to 200 second feet?

A. There would be no material effect.

Q. Why do you say that?

A. Because on the basis of the existing commerce in the neighborhood of 2,000,000 tons a year, in my opinion there is amply water available to take care of losses by leakage and evaporation and take care of locking that volume of commerce.

Q. Assuming the Winfield and Gallipolis dams to have been
placed in operation and assuming an annual amount of commerce
on the Kanawha River of 15,000,000 tons, what, if any, adverse
effect upon navigation on the pools of the Kanawha River, would
result if the flow into the London pool were reduced for
2309 a prolonged period to 500 second feet?

A. There would be no adverse effect under those conditions.

Q. Please state why?

A. Because it would still be possible to maintain project pool elevations and have enough water for losses due to leakage and evaporation, and to lock through commerce to the amount of 15,000,000 tons a year.

Q. Now assuming the Winfield and Gallipolis dams to have been completed and placed in operation, and assuming an annual commerce of 30,000,000 tons at Gallipolis, what, if any, effect upon navigation on the Gallipolis pool would result if the flow of Kanawha River at its mouth would be reduced for a prolonged period to 500 second feet?

A. There would be no adverse effect under those conditions.

Q. Please give your reasons for that.

A. If the flow into the Ohio River from the Kanawha were reduced 500 second feet there would still be enough water in the Ohio River at the Gallipolis lock and dam to take care of the requirements for lockage, leakage and evaporation, even with an annual commerce of 30,000,000 tons.

By the COURT:

Did you make your calculations in respect to that question with reference to the number of vessels that might be carrying or bearing the tonnage?

A. I did not quite make it that way, but with the same results, probably, because I took and assumed the loading of a particular barge. Take a thousand ton barge for instance, I assumed it would be loaded——

Q. What I meant was that you must have taken some basis in that regard.

A. Yes, there is a basis for that matter. I assumed 48 lockages per day, through the locks, and that the average tow would be 2,500 tons, composed of four to six barges. In other words, 2310 going downstream, the loading would be considerably more than 2,500 tons. Then the barges might come back light, so that would reduce the average tonnage and the average tonnage per lockage, and on that basis with 48 lockages per day and 2,500 tons per lockage, for a 300 day period, allowing 60 days for miscellaneous interruptions, which is more than ample on the Ohio River, it comes out 36,000,000 tons a year.

By the COURT:

The reason I asked this question was I wanted to find out how much weight to give your evidence, and I wanted to know the basis on which you made your statement.

A. Is that clear enough?

Q. Major, in arriving at this answer or figure that you have just given, did you compute the lockage requirements?

A. I did.

Q. Did you compute it in accordance with any practice recognized by army engineers in reporting on the subject?

A. I couldn't say I took their actual method of calculation, but it is entirely based upon figuring out what is the reasonable expectation in the way of number of lockages per day you can get through a lock in the first place. In other words, if you assume there is going to be some interruptions and traffic will not move without a hitch entirely, and you assume a lock of a certain lift, say in the neighborhood of 20 feet, one lockage, according to experience would take, on the average, about half an hour. That would mean 48 operations per day, if the locks were being used continuously. Then you compute the amount of water contained in a single lockage.

By the COURT:

Q. Do you have the dimensions and capacity of those locks?

A. Yes, I have.

By Mr. Jackson:

Just finish your answer.

A. Then running that into the number of days per year, you
get the total number of cubic feet of water required
2311 in the 48 lockages per day. Then you have to convert
the total number of cubic feet back to day second feet,
that is, cubic feet per second, used continuously throughout the day. For purposes of illustration, at the Gallipolis lock, at 48 lockages per day, and in the first place a single lockage requires 20 day second feet, and therefore 48 lockages per day would require 960 day second feet, in other words, 960 cubic feet per second would be required.

By Mr. Jackson:

Q. Am I right in assuming or understanding that on that hypothesis there would be continuous operations at the locks for 24 hours?

A. Practically so, and then convert that into tonnage, and you can make an assumption of how much would be the average cargo locked through at a certain time.

Q. Do engineers, in studying this subject, make estimates this way?

A. They do. As a check, I found the War Department had a lock on the Ohio River with over a 13 foot lift, they allowed 45 lockages per day and gave an annual capacity of 37,000,000 tons per year. That was approximately the figure I got, 36,000,000 tons.

Q. Please state whether as a practical matter it is possible to maintain a slack water navigation pool at constant elevation without any minor variations from the nominal pool level?

A. Based on experience, from the navigators end, I have learned that in practice the pools are not kept at the theoretical project elevation, but there is usually a minor variation, possibly 6 inches one way or the other.

By Mr. Jackson:

Q. Major, shortly before recess you testified that as a practical matter, minor variations up to 6 inches above or below nominal pool level do occur at slack water navigation. Will you please state what, if any, effect, such minor variations from nominal pool level have upon practical navigation?

2312 A. Navigators themselves take this into consideration
when it comes to the loading and maneuvering of their
vessels.

It has been found from experience that dredging operations themselves cannot be conducted to that particular degree of accuracy, namely 6 inches. It is also the experience of navigators that nature itself upsets conditions more rapidly and to a greater extent than the minor changes in pool levels under consideration would. It has also been found by experience that the operators of the pool cannot maintain that degree of accuracy. For that reason I made my first statement, that navigators, having these various elements of uncertainty to contend with, find that the possible fluctuations in pool levels are only one of several things with which they contend, so that in making allowances for these other difficulties, they, at the same time, make allowances for minor fluctuations in pool levels.

2313 Cross-examination by Mr. THOMPSON:

Q. Mr. Putnam, I think you said that you took a course at the Army Engineers School, did you not?

A. I did.

Q. That involved two inspection trips, one on the Ohio, and one on the Monongahela?

A. Yes, sir.

Q. The Monongahela is a tributary of the Ohio?

A. Yes, sir.

Q. How long were those inspection trips?

A. I don't recall.

Q. Were you there a week?

A. We took a trip which included both streams at the same time. We started on the Monongahela river and went downstream to Pittsburgh and down as far as Louisville. I thought it would take a week or ten days, and it was somewhere in that range, but I would not say exactly.

2314 Q. How long were you at the Army Engineering School?

A. From September 1914 to May 1916.

Q. That is located where?

A. At the present time it is located at Fort Belvoir, Virginia.

Q. Where was it when you took your course?

A. At the Washington Barracks.

Q. As a matter of fact, all of your work there was technical, that is, theoretical?

A. All the work I had at the Army Engineering School with respect to river and harbor improvements, outside of these two inspection trips, was confined to the study of text books, documents and lectures.

Q. And most of your work there was with regard to the movement of troops?

A. No, sir.

Q. Or engineering work in that line?

A. No, sir, it was not.

Q. I think you said you went to Europe on a trip?

A. Yes, sir.

Q. And that you went to Germany?

A. Yes.

Q. Did you inspect the canal that runs from the Danube to the Rhine River?

A. I did not.

Q. Do you know there is a canal that goes over two ranges of mountains and connects those two rivers?

A. I have heard of some such project.

Q. When you were in Europe I thought you made studies of these various conditions?

A. I made studies in Europe which I thought would apply to a local situation.

Q. The local situation was the Chicago situation, was it?

A. It had largely to do with the question of the relationship between barge transportation and ship transportation and 2315 whenever I found a combination of the two, I made investigations accordingly.

Q. You know that the canal that connects these two rivers is a barge canal?

A. I don't know much about that particular canal.

Q. Was your trip to Europe—over how long a period of time was it?

A. It was between two and three months.

Q. How many countries were you in?

A. I was in France, and I went through Switzerland to get to a certain point on the Rhine in Germany. I went through Amsterdam to get to Belgium and I was in Belgium and in England and in the southern part of Scotland.

Q. You did not, therefore, see many projects of power development or anything of that kind over there on navigable or non-navigable rivers?

A. I just recall one or two; not to any extent.

Q. Your trip was more or less a pleasure trip, wasn't it?

A. No, sir.

Q. What did you do in the way of hydrography, in the way of study?

A. Nothing in the way of hydrography.

Q. And you did not do anything in the way of construction, did you?

A. I inspected the construction of several projects.

Q. And none of these projects were power projects?

A. No, sir.

Q. When you returned, you returned to Chicago and you were the assistant district engineer, I believe?

A. That is not correct.

Q. That was afterwards, was it?

A. Yes, sir.

By Mr. **Jackson**. That was before.

By the **Witness**. Before the European trip, I was district engineer at Chicago.

By Mr. **Thompson**:

Q. You represented some company in Chicago. What was the organization that you represented when you came back from Europe.

A. I was connected with or engaged by the Commercial Club at Chicago.

2316 Q. Do you still represent them?

A. No, sir.

Q. You represent the other company—the shipping company, do you?

A. I am secretary and treasurer for that company.

Q. Did you give the name of the company?

A. No, sir.

Q. What is the name?

A. Leathem-Smith-Putnam Navigation Company.

Q. The Leathem-Smith-Putnam Navigation Company?

A. Yes, sir.

Q. Their office is in Chicago, is it?

A. Yes, sir.

Q. Do you spend most of your time there?

A. Most of my time, yes, sir; I will say about seventy-five per cent.

Q. How long were you district engineer?

A. About four years.

Q. So that approximately you were with the Government about five years?

A. Approximately—exactly five years, yes, sir.

Q. And since then you have been in Washington practically all of your professional life?

A. In Chicago.

Q. I mean Chicago. Please excuse me. The area around Chicago is very flat, isn't it?

A. Yes, sir.

Q. Do you know the course of the Des Plaines River?

A. Fairly well.

Q. Do you know of a divide from Chicago River that you had to go over in times past to get to the Des Plaines River?

A. I live within about two miles of it.

2317 Q. It is a fact that in Chicago that this river, the Des Plaines, runs through the town of Cicero part of the way on one edge of Cicero, isn't it?

A. It may for a fraction of a mile go near Cicero. I don't think it touches it.

Q. There are a great many bridges—cement bridges crossing that river, are there not?

A. Yes, sir, there are.

Q. And there are places where it is almost impossible to observe what was the channel of the river?

A. (No answer from witness.)

Q. Do you recall where the park is now?

A. There is a forest preserve section, I believe, around that particular point.

Q. And in the forest preserve, you cannot see anything but sand?

A. The old channel is obliterated by artificial filling and things of that character.

Q. And isn't it a fact that it is practically impossible for a child even to put a play-boat on there at that point?

A. At that particular location?

Q. Yes?

A. No, I don't think so, at that identical spot. I don't know the exact point—it is pretty hard for anybody to identify that, but in that vicinity there is a small amount of cano'ing.

Q. There is no possibility of navigation on that stretch of the river now, is there?

A. Not in its present stage, no, sir.

Q. And there hasn't been any navigation there for one hundred years, has there?

A. I don't know.

2318 Q. What do you mean when you speak of navigation?

A. By navigation I mean the practical use of a stream by boats carrying cargoes or trade or commerce of some form and variety.

Q. What size boats do you mean would do it?

A. I would not place any restrictions on the size except below a point where they will be so small as not to be of practical use.

Q. Would you say that a channel that was carrying canoes that carried two tons or less, for one-third of the year only, would be navigable?

A. For one-third of the year only?

Q. Yes.

A. I would not.

Q. You would not think that was navigable.

A. No, sir.

Q. Do you know that in the case of the Economy Light and Power Company the question arose over the navigability of the Des Plaines River and the records show that for only one third of the year in times past, in the early days, there was a possible navigation without having to portage one-third the distance of the Des Plaines River?

By Mr. **Jackson**. We object to that because it does not correctly state the record and it is immaterial and irrelevant and incompetent.

By the **Court**. He may answer.

By Mr. **Jackson**. We except to the ruling of the Court for reasons stated.

A. I don't know that the records show that.

Q. If the records show that, would you say that the Des Plaines River was navigable in its natural state?

By Mr. **Jackson**. We object to that, because it does not include the full statement of the record.

By Mr. **Thompson**. I am just testing his judgment as to what he means by navigation. He says it is not navigable.

The foregoing objection is overruled and the defendant, by counsel, excepts to the ruling of the Court for reasons stated.

By Mr. **Thompson**:

Q. I will ask that the question be read. [The question is read.]

A. That would all depend on whether or not that was the only means of transportation involved, and as to whether or not there were other means available that were more practicable, so that there would not be any choice between the two methods. As I previously stated, the question of navigability has some relationship to its practical use.

Q. Do you consider the Des Plaines River a navigable river?

A. I made no study of that with that in view.

Q. You can look at it. You don't have to study it.

A. It may have been susceptible of use in the early days by the boats that then prevailed.

2319 Q. How many railroad bridges are over it within the distance of ten miles of Chicago?

A. I don't know.

Q. How many various railroads run by it, do you know?

A. Yes, sir.

Q. The Santa Fe?

A. Yes, sir.

Q. And the Rock Island?

A. Not the Rock Island.

Q. That is about a mile over there?

A. It comes in fairly close to the Des Plaines in Joliet.

Q. The water is taken out by canal out of the river and subsequently, away below is brought back in the river?

A. No, sir; that is not true.

Q. What canal is that?

A. The Chicago Drainage Canal.

Q. The Chicago Drainage Canal?

A. It takes no water out of the Des Plaines except in time of floods, the Des Plaines flows into it.

Q. What is the canal between the lake and the river—the older canal?

A. The one to the southerly side of the drainage canal?

Q. I am not sure that it is south?

A. It is south and easterly, a diagonal line; that is the old Illinois and Michigan Canal.

Q. Doesn't it take water out of the river?

A. It may have years ago, but I don't think so. The main drainage canal is between this small canal and the Des Plaines River.

Q. You know something about the Des Plaines River and its location, do you?

A. Yes, sir.

Q. The question I want to ask you is, if in your opinion, you think it is a navigable river.

A. I cannot give such an opinion.

2320 Q. You have looked at it a great deal more than you did at the New River?

A. There is no question about that.

Q. And you have lived within two miles of it?

A. Yes, sir.

Q. And from your own observations, would you say it is a navigable river?

A. From my own observations, I would say it is not susceptible to use by boats carrying trade or commerce.

Q. Do you know whether or not there has ever been any navigation on New River?

A. I have noticed references to—in some of the earlier reports of the Chief of Engineers, of the use of the river by boats in certain sections.

Q. What kind of boats were those?

A. As I recollect the description, they were called bateaux.

Q. And those boats were about how long?

A. Roughly, I would say fifty feet.

Q. How many tons would they carry?

A. I don't recall that definitely; I will say in the neighborood of two or three tons, on a very slight draught, that is about ighteen inches or two feet.

Q. Didn't the Army report say that they carried six or eight r more tons?

A. I don't recall that.

Q. Do you remember from the Army Engineers' reports, how nany of those boats there were on the river—on New River?

A. According to those reports, as I remember them, they referred to some ten or twelve boats or thereabouts that were in xistence on the river at one time.

Q. Didn't they finally go to eighteen or twenty-five boats?

A. I don't remember that figure.

2321 Q. In reading these reports of the early days of the engineers you gave credence to those reports, didn't you?

A. Yes, sir.

By Mr. Thompson:

Q. You said that it was not navigable in its natural state?

A. I said it was not navigable in its natural state, yes, sir.

Q. Let me read to you from Plaintiff's Exhibit No. 47, on age 6: "In 1883 there were about seventeen keel boats in this raffic and there are still about ten or twelve of such boats now n the river. These keel boats, as they are called, in this traffic, ave an average length of about sixty feet and a width of six or ight feet; their draught is about two feet."

Do you remember that statement?

By the Witness. I do remember that substantial statement.

By Mr. Thompson:

Q. I will read another paragraph No. 9: "From Hinton to len Lyn, a distance of 30 miles, there was some commerce, onsisting of grains and miscellaneous merchandise." In view f that statement, would you say that New River, between these oints, was not a navigable river?

A. Yes, sir; I would say so.

Q. Upon what theory would you say so?

A. Upon the theory that this particular report that you refer o deals with the period shortly after the time some work was lone on the river between those points by the Government engieers, and my understanding of the question of what is and what s not a navigable river, refers to the river in its natural state.

Q. So you think that, New River having been improved, take t out of the class of a river that is navigable in its natural tate?

A. Not necessarily, but I don't want to be understood as saying hat it is navigable because they have made improvements.

Q. Is it your understanding that, if improvements are 2322 made on the river, it takes it out of the class of being navigable in its natural state?

A. Not necessarily.

Q. You don't know anything about the question of navigation on New River prior to the improvements made by the Government, do you?

A. The question of navigation—the fact of navigation—of navigation having existed?

Q. Yes?

A. No, sir, I do not.

Q. Let me refer you to Government's Exhibit No. 31, being report of Chief of Engineers of 1873—when were the improvements first made on New River by the Government?

2323 A. They began, as I remember it, either in 1872—I mean 1877 or 1878; I think it was 1877.

Q. I am reading from a report of the Chief of Engineers. I have just given you the Exhibit number; "The present system of transportation on this portion of the river is by keel boats, which carry from two to three tons and are rowed or floated down the river and poled up," and I am now referring to the point from the Lead Mines to the Greenbrier. Would you say that there was not any navigation on the river prior to the improvements made by the Government; after reading that statement?

A. I would not say that there was not any navigation.

Q. If there was navigation, wouldn't that part of the river in its natural state be a navigable river?

A. No, sir.

Q. Why not?

A. Because there is nothing in this report to say whether or not that was a regular or an intermittent system of transportation; what time of the year it occurred—whether or not they handled that in August or more or less through the year regularly. There is nothing in that statement to cover that.

Q. That statement doesn't mean a thing to you, then?

A. It only means what it says—that the present system is by keel boats.

Q. If they were keel boats, wouldn't that mean that the river was navigable?

A. No, sir; not necessarily.

Q. I call your attention to Government's Exhibit No. 33, at page 62, being the report of 1877. "A survey of this portion of New River—the improvement of New River from Wythe County to the mouth of the Greenbrier River. A survey of this portion of New River was made in 1872 and the report was printed in

the Annual Report of the Chief of Engineers for 1873.
2324 Two estimates were submitted, one looking to an improvement to facilitate the navigation by keel boats, now used, at a cost of $100,000; the other contemplated a three-foot steamboat navigation to cost $1,000,000." Do you recall reading that section?

A. Yes, sir.

Q. Would that have any effect upon your determination as to whether or not there was navigation prior to the improvement on the river by the Government?

A. No more than the previous extract that you read to me and for the same reason.

Q. You spoke about John Marshall's report. You read that report, didn't you?

A. I did.

Q. When did you read that report?

A. About two weeks ago.

Q. In the preparation of this case?

A. Yes, sir.

Q. You also spoke about Moore and Briggs' report?

A. Yes, sir.

Q. You read it, did you?

A. Yes, sir.

Q. About two weeks ago. Both of these reports tell about trips going down the river from Hinton to the mouth of the river, do they not?

A. I am not sure about both, but I am reasonably sure that one or the other did.

Q. Which one of them did?

A. The Moore and Briggs', as I recall.

Q. Did you forget about the trip of Chief Justice Marshall, when he said that he got all the way down, except that he had to get out at one place?

By Mr. Jackson. We object to that.

2325 By the Witness. He came down towards——

By Mr. Thompson. (Interrupting.) To the mouth.

By the Witness. Beeween Hinton and the mouth.

Q. And he went through what is known as the Narrows—the gorge, I mean.

A. I recall a reference to that.

Q. Would you call a trip like that navigation?

A. No, sir; I would not.

2326 By Mr. Thompson:

Q. The fact that Moore and Briggs went from Sinking Creek to Hinton and to the mouth of the river, would that have any influence upon you as to whether or not you could determine if this river, in its natural state, was susceptible of navigation?

A. It would not.

Q. If it is a fact that a man by the name of Laomi Baldwin made a trip down the river through the gorge, would that have any effect on your conception of navigation?

By Mr. **Jackson.** We object to that because it is highly improper. That report was introduced only to show that Baldwin went to Kanawha Falls and he failed to get by there and finally they had to meet him in a boat from Charleston.

By Mr. **Thompson.** I challenge that statement.

By the **Court.** There was a big dispute as to whether or not Baldwin travelled by land or sea.

By Mr. **Thompson.** He is interrupting me [indicating Mr. Jackson].

By the **Court.** Let's get the Baldwin statement.

By Mr. **Jackson.** If counsel will point out to me anything showing that he travelled by boat down there, I would like to see it.

By Mr. **Thompson.** That is about a survey that he made.

By Mr. **Jackson.** That is an official report.

By Mr. **Thompson.** That report is silent on that question.

By Mr. **Jackson.** If he can show me what I asked for, I will withdraw my objection and apologize.

By Mr. **Thompson.** We have here a history of Summers County [indicating].

By Mr. **Jackson.** That is not in evidence and is not proper.

By Mr. **Thompson.** Mr. Kegley said it was worthy of consideration; Mr. Kegley vouched for it. There is no mention of his going down the river in that report.

By Mr. **Jackson.** That is the reason you did not put it in.

By Mr. **Thompson.** Certainly not. It is entirely silent.

By the **Court.** What does it say there?

By Mr. **Thompson** (reading): "The New River country was visited by Chief Justice Marshall, and they went down the river as far as its mouth at Foss east of Summers Courthouse, and then they turned up New River and proceeded to the mouth of Indian Creek, then they ran on down the river to the present site of Hinton, and then down New River to its mouth."

By Mr. **Jackson.** That is impeached by Mr. Baldwin's own report.

By the **Court.** The historian says that they moved up and down New River on a boat and came to the mouth of the Greenbrier and proceeded up the river in a boat.

By Mr. **Thompson.** That report is perfectly accurate, but it does not refer to this trip.

By Mr. **Abbot**. Which shows that he did not take it.

By the **Court**. Does the historian say the date of that?

By Mr. **Thompson**. Yes, sir; in 1817.

By Mr. **Jackson**. He has got that confused with Moore and Briggs and the history of Summers County is a work that is strikingly notable for its absence of authorities.

By Mr. **Thompson**. He gives the length of the boat as 50 feet long.

By Mr. **Jackson**. That is pretty conclusive.

By the **Court**. What was the question?

By Mr. **Thompson**. I asked him if such a trip was made by Baldwin in 1817 down the river, through what is known as the gorge, whether or not that would have any effect on his opinion as to whether or not New River was navigable waters in its natural state.

By Mr. **Jackson**. We object to that, because the only evidence in the record shows that he never went down the river in a boat.

By Mr. **Thompson**. May I read to the Court a paragraph from Rogers on experts at page 79 and 80: "On cross examination of a witness, counsel may be permitted to ask hypothetical questions, whether or not the facts were testified to by the witness or not."

By the **Court**. I don't think that quotation is at all applicable. You asked him the question about Baldwin going down the river and you are asking him to assume that it is true. I don't know—this man has written a long report here and he said he had a great deal of difficulty. I don't know whether he said he went down New River or not.

By Mr. **Thompson**. There is not a word about it, no, sir.

By Mr. **Abbot**. No, sir. He says he went to Kanawha Falls and could not go down New River to do that, and that he met a boat below Kanawha Falls sent up from Charleston to meet him. Why would he do that if he had just gone down the river.

By the **Court**. He does not mention New River in his report.

By Mr. **Thompson**. No, sir. We objected to it.

By Mr. **Jackson**. We did that because you implied that he made a trip down the river in a boat, and we wanted to show what he did do.

By the **Court**. It comes to this—you have introduced a history of Summers County, in which some historian says that Baldwin made a trip on New River in a boat in 1817. In rebuttal of that, here is presented a copy of Baldwin's report himself, which is made to some official body—the Board of Public Works of the General Assembly of the State of Virginia—it is directed to them, relating about the trip that he took the same year, only it appears that his explorations were along the Jackson River and overland route connecting with the Kanawha River. He does not mention that he was on the New River, but his report shows that he was on the upper reaches of the James River and the Jackson River, and surveyed a road overland to Gauley River, possibly where the Gauley runs into the Kanawha, and from that point, he traveled, at least a portion of the way, by boat. Now, we have here two conflicting pieces of evidence. You want me to assume that the historian is correct and that as to Baldwin himself, his report is inaccurate.

By Mr. THOMPSON. I do not understand that they are in conflict in any way. I don't know how long that trip took, but my recollection is that it was a few months. There are nine months left in which he could make that trip. I don't understand that they are in conflict. That is the reason I objected.

By Mr. JACKSON. The History of Summers County has not been received in evidence and if anyone goes on the stand to vouch for it, we want to cross-examine the witness. I don't think you can find a reputable historian to vouch for it.

By Mr. THOMPSON. We can produce the record and show where Mr. Kegley said it was reliable.

By Mr. THOMPSON. We had it marked for identification.

By Mr. JACKSON. You offered it and we objected and were sustained.

By Mr. THOMPSON. We will offer the book in evidence.

By Mr. JACKSON. We will want to cross examine whoever presents it.

By the COURT. I think the statement in this history is not of value. The statement of Baldwin does not say anything about New River. He says he came over Kanawha Falls at the same time that the historian says he traveled up and down New River and the historian does not say anything about the difficulties of the travel or anything about the size of the boat——

By Mr. THOMPSON. Yes, sir; he says it was fifty feet long.

By the COURT. All right; but he says nothing about the difficulties; he says they traveled in a boat 50 feet long and went to the mouth of the Greenbrier——

By Mr. THOMPSON. He says the exploration was made in a boat 50 feet long and that they went to Foss, a mile East of Summers courthouse, and turned up New River and went down the river to the site of Hinton on New River at its mouth.

By the COURT. He says nothing at all about the difficulties or the lack of difficulties. Your question is based on the implication that the man went up and down New River on a boat, without any difficulties. In view of his report, I do not believe that the man was traveling on New River at all at that time. He says nothing at all about it in his own report. You can ask the question but I want to tell you what I think about the history of Summers County.

The defendant, by counsel, excepts to the ruling of the Court for reasons stated, and because it is immaterial and irrelevant and not based on the evidence in this case.

By Mr. **Thompson**:

Q. I will ask that the question be read.

(The question is read.)

A. Even if such a trip were in fact made, it would make no difference in my opinion.

Q. Major, I want to read you a reference from the report of the Chief of Engineers for the year 1879, Exhibit 35:

"The detail maps of the season's operations completed in the office, the property collected together and put in repair, and, finally, all boated down to Hinton, West Virginia, at the mouth of Greenbrier River, a distance of 84 miles, to which point, under your decision, operations were to be transferred in the future as a base. Everything was closed up by October 15."

Do you remember reading that?

A. What page, if you please?

Q. I have got the original here, but I haven't the exhibit.

By Mr. **Thompson**:

Q. Would that affect your judgment as to whether the river was navigable, or not, in its natural condition?

A. It would not affect my judgment.

Q. It would not affect your judgment?

A. No.

Q. Would the fact that the Army Engineers had sent a boat with a motor attached to it, an outboard motor, drawing about two and a half feet, from Hinton to Allisonia and back, within the last few weeks, influence your judgment as to whether
2327 New River is a navigable river?

Mr. **Jackson**. I object to the question unless he states the size of the boat and the difficulties encountered in pulling over ledges and bars.

By the **Court**. I think there should be some indication of the size of the boat.

By Mr. **Thompson**:

Q. A boat 16 feet long, and five feet wide, and drawing two and a half feet of water at the most?

Mr. **Jackson**. I think it should be shown that the witness stated——

Mr. **Thompson**. I do not care to have counsel address me.

The COURT. I think the question should contain all the conditions attending that movement—the number of persons in the boat and such as that.

By Mr. THOMPSON:

Q. Four persons in the boat, and a survey outfit, and the parties getting out only once on the trip from Allisonia down to Hinton, and then getting back into the boat—in other words, not portaging—and getting out on the trip five times over shallows, but not portaging, would that influence your judgment as to whether New River is navigable?

Mr. JACKSON. I object to the question unless he shows how many times he had to pole, and unless he shows what falls they had to get out and walk over.

The COURT. You may answer the question and save the point.

Mr. JACKSON. Exception.

A. That would not affect my judgment.

By Mr. THOMPSON:

Q. How far up the river did you say you went?

A. I touched the river at a point on each of the forks in North Carolina, and then jumped back to the mouth of Wilson.

2328 Q. And when you were noticing the flow of the river, did you know whether or not the Buck dam was closing down for any period of a day and then discharging water?

A. No, I did not.

Q. So that, when you looked at the river, you would not have known whether that was having any effect on the depth of the river, would you?

A. I would not know how much effect it would have on the depth of the river.

Q. You would know, though, it would have effect?

A. It would have some effect on the depth of the water in the pools and the amount of water that went across the falls.

Q. Would your judgment have been changed by the fact that, at the time you were looking at the pools, or shallows and water, the water had been shut off, or whether the wave had reached that point?

A. I do not think so, because I could see from the water line where the water had been some time during the day previous, and still showed exposed rocks and boulders and shoals that had no evidence of the water line.

Q. That would indicate that you did notice that there was fluctuation?

A. Yes, I did notice that there was a fluctuation.

Q. Now, let me get the date that you went over there? Where did you start from?

A. I started from here.

Q. From Roanoke?

A. Roanoke, yes, the morning of July 28th, this year; then eaded for North Carolina, crossing the river enroute at Jackn Ferry; then beyond Galax, coming back on the other side of e river; then at a point where I crossed New River some little stance this side of the line, and then down in North Carolina— rst crossed the South Fork and then the North Fork, and then back a road.

29 Q. Where did you stop that night?

A. I came all the way back to Roanoke, getting in about o'clock in the evening.

Q. How many miles did you travel that day?

A. I will say between 300 and 350. I don't know exactly.

Q. Did you attempt to look at the river that day at all?

A. I did.

Q. And is that all the time you spent on the river up-stream— at is, from Radford?

A. That is all the time I spent on the river between Jackson erry and the North Carolina points I mentioned.

Q. Is that the only time you were ever up there?

A. No. I was up there in the lower end again last Saturday, the location just below the Buck dam—a little above Ivanhoe urnace.

Q. But you did not go up above Buck dam at any other time, d you?

A. No, I did not.

Q. That was the only time. Well, now, how many places did u stop on your trip when you made the 350 miles in a day— at is on the river?

A. About ten different places.

Q. About ten.

A. Yes.

Q. The water in the river is very low, isn't it?

A. I have no information as to the amount of water in the ver. There was not much water at certain places I looked, if at is what you have in mind, but I would say that is below the wer dam. Above it would depend on the natural flow.

Q. You do not know the natural flow?

A. Only as reported in previous surveys, which I had studied eviously.

Q. On your ten stops, did you make any measurements of the depth of the river? Did you get out into the river yourself?

30 A. No.

Q. You just looked at it from the shore?

A. Yes.

Q. So, if there was a channel there, you would not know how deep the channel was?

A. I would not.

Q. Now, what time were you at the power dam?

A. I would say between 3 and 4 o'clock in the afternoon.

Q. And was the project discharging water at that time?

A. I don't know.

Q. What was the condition of the flow of the stream on that Saturday when you went up on the trip from here to the power dam, as to flow?

A. The stream was in a pretty low condition.

Q. In a pretty low condition?

A. Yes.

Q. What did you do when you got out on those visits? Did you just stand on the shore and look at the river?

A. I looked at the river, looking at the configurations of the bank, to see what effect would happen, roughly, with increased stages. I noted wherever I happened to drop in whether or not there was a section of pools there, whether or not there happened to be riffles, or boulders or shoals.

Q. There was not any way, on this trip, for you to make any check as to depths, as to whether the mile-to-mile depths, as shown by Craighill and others, were correct or incorrect?

A. No.

Q. As a matter of fact, if you made ten stops and covered 350 miles in a day, a part of which I understand was on pretty rough roads, they were short stops?

A. It was a long day.

Q. What time did you start?

2331 A. 7 o'clock in the morning.

Q. What time did you get back?

A. I think about 10:30 or 10 o'clock.

Q. What time did you get to New River? What time did you first see New River on that day?

A. That is when I crossed at Radford, which would be an hour to an hour and a half from here.

Q. Do you remember what your next stop was?

A. I didn't stop at that particular crossing, as I wanted to get up at the far end, and I went to Jackson Ferry, and then went to these other places, and stopped at the last point before I went into North Carolina.

Q. What time of day would it have been?

A. 11:30 in the morning.

Q. So the ten stops you made were made from 11:30 until what time in the day?

A. The last stop was at 5:30 in the evening.

Q. That is six hours. Now, can you remember where the stops were you made—at what points?

A. Not without reference to my notes. I can remember some, but not all.

Q. Can you give us those you remember?

A. I remember the stop at the highway crossing just before getting into North Carolina. I remember the stop at the two branches up in North Carolina. I remember the stop just below the mouth of Wilson and a stop at the foot of what is known as Osborne's Shoals.

Q. Where is that?

A. Roughly, six and a half miles below the mouth of Wilson. The next stop I can recall was just below Fries. The next was in the vicinity of Ivanhoe Furnace. The next was the Lead Mines. The next was just above Jackson Ferry, and the last was at Foster Falls.

2332 Q. That is nine, I believe.

A. I must have missed one. I just counted ten.

Q. Well, four of those stops were made at points not downstream further than Wilson Creek?

A. There were two of them made beyond the mouth of Wilson.

Q. I think you gave four made at Wilson or further upstream?

A. The point the highway crosses is just below the mouth of Wilson.

Q. Just below?

A. Several miles. I don't know how many, but four to six.

Q. If you had spent all your time at these various places, you would have spent about half an hour at each one of them, wouldn't you?

A. A little more than that.

Q. So that subtracting from that the time you took to make the automobile trip, you had very little time to stop and look at the river, did you not?

A. I don't imagine I averaged over ten or fifteen minutes at any one point.

Q. At what other time have you seen the river? The first trip was on the 28th, and then I believe on Saturday you went to the Buck dam?

A. That was last Saturday I went back. The first time was on the 28th of July.

Q. Now then, from Radford down, what did you do in the way of looking at the river?

A. My first visit there was on the 29th, starting in at the Radford dam site. From there I worked on down to Hinton, getting there late in the afternoon.

Q. And you ran from Radford to Hinton from the morning until the late afternoon?

A. Yes.

Q. What time did you start in the morning at Radford?

A. I think I started at Radford abut 8:30.

2333 Q. And you got down to Hinton about 4 or 5?

A. About 5 o'clock.

Q. It is 84 miles by road, isn't it?

A. I don't recall. It is not a very long way.

Q. How many times did you stop during that time from Radford to Hinton?

A. I stopped at the Radford dam site.

Q. That is about six miles above town, isn't it?

A. Yes. Then Ingles Ferry, crossed over at that point, and stopped there a few minutes. Then went down to the vicinity of Parrott Mines, and followed along the river to Walker's Mount Falls, I believe that they call it. Then I retraced my trip, and got back to the main highway, and went through to Pearisburg and over to the river at Klotz Quarry, I think is the name of the plant. Then back through Pearisburg to Narrows, Glen Lyn; then down on the back road along the river, passing Shumate Falls, stopping at Wylies, continuing on down that road to Crumps Bottom. I did not stop there. Then down to above Bull Falls, where I took the ferry across the river. Then down to Hinton.

Q. Do you make that eight stops altogether?

A. Seven would be the actual number of stops. I may have mentioned one for two stops.

Q. You were gone, as I figure it, from Radford eight hours and a half—that is, from 8:30 to 5—and you stopped off about an hour for lunch, did you?

A. Half or three-quarters of an hour. I did not take the full hour.

Q. We will call it a half an hour. You traveled approximately 100 miles. You doubled back?

A. No; I spent the night at Hinton. I doubled back a part of the way. It would make it, roughly, 100 miles from Radford.

2334 Q. And a good part of that time you were not in sight of the river, were you?

A. From the time I cut across from Radford and back to the river at Parrot Mines, I did not see the river in that stretch, and from Pearisburg there is a stretch of about 30 miles in there I didn't see it. The rest of the time the river was in sight most of the time.

Q. So your stops were about the same as the day before—about ten minutes?

A. I think that they would be longer, because I had more time.

Q. How long do you make them?

A. Not over an average of 20 or 25 minutes.

Q. Did you cover on your trip the stretch from Foster Falls to Radford?

A. No, I didn't get in that section at all.

Q. You didn't see that section at all?

A. No.

Q. That is a distance of how many miles?

A. Twenty-five to thirty.

Q. About thirty-eight by the Geological Survey. Did you go any farther down by Hinton by motor?

A. Yes, the next day I went down from there to the mouth of the Kanawha.

Q. That was on the 30th was it?

A. That was on the 30th.

Q. And that was from Hinton to the mouth of the Kanawha?

A. Yes, sir—No, I mean the mouth of the New River, pardon me.

Q. When did you start that day?

A. I left Hinton at 7:45 in the morning.

Q. And when did you get down to the mouth of the river?

A. A little before noon.

Q. That would be about four hours?

A. Yes, four hours.

2335 Q. You didn't follow the river, couldn't see the river part of the time, could you?

A. I could not see the river for quite a part of the time.

Q. How many stops did you make between Hinton and the mouth of the river?

A. Stopped at Stretcher Neck, in the vicinity of Stone Cliff, crossing the river at that point and back-tracking to get up on the road on top; thence to Fayette, and down toward Fayette station, and stopped again at that location; then I back-tracked again and the next place I got to the river was at the main highway crossing below Hawk's Nest development.

Q. Did you go up to the Hawk's Nest?

A. Yes, I went down to a place overlooking the valley where you could see the Hawk's Nest development.

Q. That would be four stops you made there and Stretcher's Neck, Fayette and Hawk's Nest.

A. Stopped at the crossing below Hawk's Nest.

Q. That would be five?

A. Yes, sir.

Q. So you didn't have much time to stop and view the river, did you, covering that distance in four hours?

A. No, I would say ten or fifteen minutes to a stop.

Q. Was it upon that basis of time you made your estimate of $200,000,000 for cost of improving navigation to a nine foot depth on New River?

A. No, sir.

Q. That was your sole inspection of the river, was it not?

A. Yes, sir.

By Mr. **Jackson**:

Q. You don't mean those three days was the only inspection?

A. No, I testified I had on August 10th made another trip in the vicinity of Buck, and it was on that trip I took in several other points that subsequent study had shown I ought to look at with more detail.

By Mr. **Thompson**:

2336 Q. What other places beside Buck?

A. From downstream working up, so I can remember the chronology, I began at Bulls Falls, Wylie's Falls, Shumate Falls, Walker's Mountain Falls.

Q. You mean you looked at those the second time?

A. Yes, sir; and the Sifford's Falls.

Q. Did you stop and look at Bulls Falls?

A. Yes, sir.

Q. Would you regard that as passable by a motorboat?

A. It might be passable.

Q. So that that spot you would say was navigable?

A. No.

Q. If it was passable by motorboat you wouldn't say it was navigable?

A. No, sir.

Q. You think navigation by motorboat is not navigation?

A. If it were continuous and substantial it might be navigation, but a mere passage by motorboat would not make navigation.

Q. What would lead you to believe it wasn't continuously passable?

A. No question was put to me as to that.

Q. Would you say it was not continuously passable or navigable by motorboat?

A. I would say most times you could go downstream in a motorboat, but that doesn't make it navigable.

Q. Could you go upstream?

A. I would say possibly at low water. Take a pretty good motorboat to do it.

Q. If you could go at low water, couldn't you go in a motorboat at average flow?

A. I wouldn't know because I wouldn't know what the current velocity would be.

2337 Q. So far as that particular spot is concerned, you don't know whether it is navigable or not?

A. Yes; I do; in my own estimation.

Q. Your own opinion?

A. Yes.

Q. Based on what you told us here?

A. Yes, sir.

Q. Would you say Bulls Falls was impossible for a motorboat to go up if a party could take one of these punts or flat-bottom boats and push it over the Falls at low water?

A. I am not sure I am clear as to what you mean by punt.

Q. What they call a punt is a canoe or some name for a flat bottom boat.

A. Such as you see on some of these pools around here?

Q. Yes.

A. What is the question?

Q. Isn't that Fall there practically navigable so far as getting up the river is concerned?

A. No; it is not. Probably at low water it constitutes a drop of two or two and a half feet.

Q. Have you ever heard there was navigation for many years by bateaux up and down that river at that point?

A. You read to me an extract from a report showing during certain years a certain number of bateaux had operated in there.

Q. That would not affect your judgment as to whether that particular part was navigable?

A. No, sir.

Q. How did you arrive at this expenditure of $200,000,000; in other words, how many reservoirs did you figure on constructing?

A. I figured an average lift of twenty feet at each dam, making roughly about 1,800 feet of fall, approximately 1,800 feet between the head of the London pool and the mouth of Wilson. I mean, to overcome that fall some 90 locks and dams would 2338 be required, with an average lift of twenty feet.

Q. Why did you only make it twenty feet?

A. Because, there were two reasons for that, in the first place I felt if I exceeded twenty feet in some locations we would get into difficulties with the railroads along the bank; in the second place there is from the point of view of improving a stream for navigation an economical limit, beyond which it is not wise to go on the question of lift, in other words, in attempting to save the number of dams, the cost of your structure per foot of lift increases somewhere above that point; and between those two I reached the conclusion a twenty feet average lift would be a reasonable assumption to make.

Q. The road-bed of the railroad, the C. & O. up through what is known as the Canyon is at least forty feet above the river, isn't it?

A. I am not sure it is.

Q. Any reason why you could not put in a dam higher than twenty feet, just as the Hawk's Nest people did?

A. If we don't get into trouble with the C. & O., the only reason would be an economical reason, and as I previously explained, it is generally cheaper to build two twenty foot dams than one forty foot dam for navigation alone.

Q. The dam at Hawk's Nest has a pool in it that is navigable, hasn't it?

A. Probably throughout the length of the pool; in other words, you can put boats there, if that is what you mean.

Q. And run them?

A. Yes, sir.

Q. Do you know any river where they have twenty foot dams?

A. Not exactly twenty feet, no, sir, some are twenty-four, some twenty-six, some eighteen and some down as low as ten, lots of them.

Q. Would you not, if you were building that project, or making that river navigable, for a nine foot depth, wouldn't
2339 you create power at the same time you stored your water?

A. It depends on the instructions I had. If I were told to put in a navigation project pure and simple I would put in something different than what I would if told to do something else.

Q. In this case were you told just to consider navigation?

A. This was purely a navigation project.

Q. You were not thinking in terms of what might be saved by the creation of power and amortizing that cost?

A. This was purely a navigation project.

Q. If you had created power on these projects you could have amortized your cost very considerably, couldn't you?

A. I do not know.

Q. Now the Radford project will have a pool twenty-one and a half miles, won't it?

A. I don't know.

Q. Don't you know the length of the pool?

A. No, sir.

Q. Do you know the defendant here has a project down at Bluestone, a double project, one at Bulls Falls and one to be at Bluestone also?

A. I have noticed reference to a possible project on the profile but that is about all I know of it.

Q. And the water from the after bay dam on the Bluestone will back the water right back up to Bulls Falls, won't it?

A. I do not know.

Q. And make it ten feet deep there?

A. I don't know.

Q. So you don't know anything about this question of proposed construction of dams up and down the river?

A. Only as I have seen from some profiles.

Q. You know the defendant is not intending to build any ten or twenty foot dam on the river?

2340 A. Any of those dams for which I have seen profiles on the river indicate some head greater than twenty feet.

Q. And everyone of those dams will improve navigation, or there will be navigation for boats?

A. There will be a navigation depth, a dependable navigation depth for the drawn down length of the pool, whatever that may be; there would remain a stretch between the high and low point you would have to do something to.

Q. You would have a pool for usable storage?

A. Possibly.

Q. And that would create navigation as the Hawk's Nest dam has created navigation?

A. It might.

Q. Now you have not given me very much information in regard to how you fixed this figure of $200,000,000. I am curious to know about that.

A. From my study of river and harbor projects elsewhere I have information as to the cost per foot of lift for locks the size used on the Kanawha at the present time 56 x 360 feet, and in this particular instance I would need 90 of those, on my assumption. Then I also have information available as to the cost of dam construction with rock foundation, roughly twenty feet of lift, or whatever unit you want to use, and combining these two I get a cost per foot of lift of the combination locks and dams, and making allowance in the dams for the relative width of this stream compared to others the cost is very close to $100,000 per foot of lift, so that comes out in the neighborhood of $180,000,000. Now the reason for rounding out that to $200,000,000 was in some places the river was pretty narrow and if you put a lock in there you restrict the stream, and might cause trouble with the flow, so there should be some margin of safety for such contingency, and still maintain the natural flow capacity of the stream. It is no more than a normal factor for safety.

2341 Q. You only made a very cursory examination didn't you, you wouldn't have anyone invest money on that basis?

A. No, I would not, sir, but I would guarantee it would not be more than 25% less than that under present conditions.

Q. As an engineer you wouldn't advise the Government to build a dam as low as the London and Marmet on as heavy a basis as those dams are built, would you, powerful, up on the New River?

A. Well I don't think those on New River would cost as much per foot of lift for the reason we are dealing with smaller quantities of flow.

Q. As I get it, you made your trip as you described it here, and then from your experience in Chicago and elsewhere, you estimated the value or cost of building these navigable dams only up the New River?

A. My answer applies to navigation dams only, but is based on a good deal more than you mentioned. It is based on not only this hurried trip over the river, but a study of all available maps and profiles and such reports as might apply to that class of construction and my experience in studying projects elsewhere.

Q. When you were along the river did you notice that the clearing away of the road-bed for the various railroads had caused rock and debris to be thrown down into the river?

A. I could see the railroads had a bank very close to the river, but whether it actually encroached on the original lines or not I had no way of telling.

Q. Do you know how far the headwaters of the New River are from the headwaters of the Tennessee River, the Holston?

A. No, I don't. Fairly close I would say, but I don't know.

Q. You stated that the river was frequently interrupted by obstructions, you were not making that statement from the stretch from Hinton up to the Buck dam, were you?

2342 A. Yes, sir; I was.

Q. That is the stretch I thought you had not been (interrupted)

A. From Hinton?

Q. I should have said Radford.

A. That statement was based on the mile by mile survey and not exclusively on observation.

Q. Can you show me in your mile by mile survey where there is low water, less than nine inches, going over the shallows from Radford up to Allisonia?

A. You can't tell from the mile by mile survey how many inches of water or what the depths are over the rapids and falls.

Q. Didn't Major Craighill in his report state it was about a foot in low water down over these shallows?

A. He may have. I don't recall that.

Q. If he did say that, then wouldn't you say that there would be navigability for boats over those shallows?

A. No; I would not.

Q. Why not?

A. Because as I said before I interpret navigability to include substantial use by boats carrying commerce and trade, and I can't conceive of boats carrying commerce and trade on a twelve-inch channel over rapids and falls.

Q. Do you consider logging and rafting navigation?

A. I would not. You have no control over that class of movement of goods.

Q. Did you know that there has been testimony here that millions of feet of lumber were floated from Hinton down to Charleston or down to what they call the gorge near Charleston?

A. No, sir.

By Mr. **Jackson**. I object to that. There is no such testimony in the record.

By Mr. **Thompson**. Do you say there was no such testimony?

By Mr. **Jackson**. Not that I heard of.

By Mr. **Thompson**. Mr. James testified to that effect.

2343 Q. Did you know when the C. & O. Railroad was being built in what is known as the gorge, that the materials, much of the materials being used on that road, were transported by boat from Hinton down the river?

A. No; I didn't.

Q. Would that affect your judgment as to whether New River was navigable?

A. I would have to inquire further into the conditions under which that stuff moved and as to whether it actually moved.

Q. If you actually found in your inquiry it did move down the river and was unloaded at Sandstone Falls and reloaded and carried further down the river, and then moved on the railroad, would that affect your judgment?

A. I can't very well make an estimate of navigability of that section of the stream on such slight information as I am getting now.

Q. What information did you have when you formed your judgment as to nonnavigability?

A. All the Government reports which I read into the record this morning, plus what I actually observed as a matter of my recent check on river conditions compared with those obtaining in the early days.

Q. Do you recall that Government reports do report that materials were floated down the river for the construction of the C. & O. Railroad?

A. I don't recall that.

2344 By Mr. THOMPSON:

Q. When you assumed, as I understood it, that decrease in the flow at the head of London pool would not cut navigable depths below 9 feet, at mile 90.5 you did not consider the possibility of a surge or oscillation below the normal pool level, did you?

A. I did not take any possible surges or oscillation into consideration in any of my replies that I made this morning.

Q. If there had been a discharge down from the London pool to the Marmet of, let us say, 6,000 second-feet, and it was suddenly cut off, would there be oscillation in the Marmet pool, in your opinion?

By Mr. JACKSON. We object to the question because it has no relation to the examination in chief and is not proper cross-examination.

By Mr. THOMPSON. I object to his guiding the witness.

By the COURT. I do not think that he is guiding the witness. Read the question. [Question read.]

By the COURT. Mr. Jackson, you examined this witness, did you not, about the decreasing and increasing depths in the pool?

By Mr. JACKSON. At certain rates per hour with a limitation, when the flow was never reduced below the amount which would maintain pool levels, or would be sufficient to meet lockage, leakage and evaporation, but this question refers to completely cutting off the water.

By Mr. THOMPSON. I understood that Mr. Jackson referred to a drop as much as 2 feet in the pool below, and he asked if they kept the pool level the same, whether there would be any effect on navigation.

By the COURT. I understood him to inquire about it, and to state if they kept the pool level at least up to its minimum depth.

By Mr. THOMPSON. I do not see how that could happen unless there was a change in the flow of the river.

By Mr. JACKSON. But not cutting off the flow entirely.

By the COURT. He may answer the question.

Defendant excepts.

By Mr. JACKSON. Read the question. [Question read.]

A. I do not know whether there would be oscillation or not.

By Mr. THOMPSON:

Q. If the flow from London to the Marmet dam was diminished, 2,500 second-feet in an hour, would that cause any oscillation in your opinion in the Marmet dam pool?

A. I made no study of the effect of oscillations or how they might be produced in those pools, so I cannot answer that question.

Q. So, as I get it, for the record, in all of this testimony which you gave this morning, you were not referring in any way to any effect that might produce oscillation.

A. No, sir; and if you will remember, I put in somewhere to this effect that they must keep up the level of the pool, if what I said were to apply. You could not have a level pool, as I see it, if you had oscillation, that is, if you had oscillation it might go below the level of the pool.

Q. As an expert engineer on the question of flow of streams, &c., will you not state, or will you state whether or not the cutting off of 2,500 second-feet from the London to the Marmet dam inside of an hour would create oscillation in the Marmet pool?

2345 A. I cannot say because, as I said before, I have not studied all the characteristics of the London and Marmet pools in sufficient detail to answer the question.

Q. Would you say the same thing in regard to the Winfield and Gallipolis dams?

A. Yes, sir.

Q. You said navigators accommodated themselves to the conditions of the river, I believe, this morning?

A. Probably words to that effect, yes, sir.

Q. Do you consider it the duty of a navigator to be on the watch for changes in the flow of the stream due to the discharges from a power plant?

A. If he has public notice that the power plant is there, then for his own protection he would be wise to carry on his operations in such a way that he will not be caught in difficulty.

Q. I did not ask you whether it was a wise thing for him to do if he knew about it, but is that his duty on a navigable river?

A. You are now getting into a question of law there that I would not be able to answer.

Q. Suppose you were a navigator and going up the river and a fog struck you and you had to spar in at some place as rapidly as possible, would you feel it was your duty, notwithstanding that the power plant, let us say, was going to cut off the discharge, and drop the stage, let us say, two feet in an hour?

A. I wouldn't say it was my duty, but it would certainly be a thing that I would look out for.

Q. Now your only answer to my question is that it is up to the navigator to look out for himself on the river, even though this discharge may come.

2346 A. As a matter of practical operation he should watch out for all these things.

By Mr. **Thompson**:

Q. Then as I understand it, you were not testifying as to the fluctuations caused by a power plant, on navigation?

A. There was no specification as to the agency which caused these fluctuations, that I discussed this morning.

Q. Can you give any instance of any river fluctuating two feet in an hour from natural causes?

A. The Kanawha River itself has done that on the rise.

Q. But that was during some very high floods, wasn't it?

A. The discharge was in the water, 65,000 second-feet, at those particular times, when the change in stage was 2.6 feet.

Q. That was during the flood, but do you know whether a storm would break over a watershed and it would rise, say the Kanawha, that there would be a rise of two feet?

A. I imagine that these discharges that I just referred to were the result of storms of sufficient intensity to produce such a rise. However, I am not quite sure that I understand you.

Q. I must have misunderstood your examination this morning, because I understood you were referring to discharges produced by artificial conditions, but as I understand you now 2347 these discharges you spoke of were produced by natural conditions?

A. No, sir; I said the agency that produced these fluctuations were not discussed this morning.

Q. Do you know in any normal times that any storm has produced on any river a fluctuation of two feet within an hour?

A. It depends on what is meant by normal. This illustration I gave is a flood condition. By normal do you mean somewhere about mean stage of the river?

Q. Yes, that is it.

A. No, I don't know of any.

Q. You said navigators easily adjusted themselves to a six inch fluctuation in the pool level. Fluctuations of 1½ to 2 feet are more serious, are they not, than six inches?

A. As long as the pool is not below project depth, they are no more critical, until you get up to the critical discharges I mentioned this morning.

Q. When they are repeated several times daily, they are more serious, are they not?

A. They are not serious until you get up to a point where the velocity of flow is such as I stated this morning, until the velocity of flow gets up to that.

Q. Are these fluctuations of more than 1½ to 2 feet not productive of oscillations in the pools below?

A. I don't know, I did not study oscillations.

Q. I believe you testified this morning, or what was it you testified to as the amount of water necessary for lockage at the London and Marmet dams?

A. With reference to navigation on the Kanawha the testimony was to the effect that if the flow were reduced to 200 second feet there would be no adverse effect on navigation, and I explained specifically, because the water available would be sufficient for lockage, leakage and evaporation for existing commerce; 2348 but there was an assumption that was put to me on that, assuming that the old dams had been replaced by new ones in the lower river.

Q. Do you know that there is an allowance of 250 second feet in the arrangement between the Government and the Kanawha Valley Power Co. for lockage and leakage on the Kanawha, on the London and Marmet dams?

A. No, I do not.

Q. Would you knowingly advise a client to expend millions of dollars on the London lock and dam and then permit the water supply to be reduced so that its full capacity could not be utilized?

A. I don't think I would.

Q. You spoke about a condition that will exist when the Gallipolis dam is completed?

A. Yes, sir.

Q. And that there was a certain amount of water there that would be used for lockage and leakage, I believe very little for leakage, mostly for lockage?

A. I stated that 960 feet per second would be necessary for lockage if we allowed 48 lockages a day of 2,500 tons a piece.

Q. Do you know that there have been quite a number of occasions when the flow in the Kanawha River during low water periods, into the Ohio, at Point Pleasant, had been greater than the flow from above Point Pleasant from the Ohio?

A. No, I do not.

Q. If you allowed simply 250 second feet during very low water periods for lockage on the Kanawha River, and you had a low water condition such as existed in October 1930, and the Ohio, and also existed in 1925, what would happen with regard to the dams below Gallipolis dam if they only had the flow that was coming through from the Gallipolis dam?

2349 A. I do not think I could answer that question because I don't know what the actual figures are as to the flow in the Ohio River at those particular times.

Q. You know the dams below the Gallipolis dam are wicket dams and they have to be caulked and needled, don't you?

A. Yes, sir.

Q. When the water gets low that becomes a very important matter with respect to navigation on the river, does it not?

A. That becomes important whenever the leakage will approximate the low water flow.

Q. And does that situation ever arise?

A. I have known in several seasons where they had to needle these dams and caulk them pretty well.

Q. Isn't it a fact they have to do that every year and at certain periods of the year?

A. We had not had so much trouble with low water then as they probably have had since.

Q. So your testimony here today goes as far as the Gallipolis dam and not beyond?

A. It does not go beyond the Gallipolis dam.

Q. You do not pretend to say what the effect on such conditions would be below the Gallipolis dam?

A. I do not.

By Mr. Thompson:

Q. I understood you to say before recess that the fluctuation on the Kanawha River of 2,500 second feet was not material to navigation on any of the pools. Am I correct in that understanding?

A. Not entirely correct. I qualified that by stating if the project pool level was maintained.

Q. Suppose that the project pool level were maintained and there was a fluctuation of 8 or 9 thousand second feet, what would you say?

A. Above or below a certain given elevation of pool,
2350 That might be there at that particular time?

Q. Yes, sir.

A. I would say that might be serious.

(Exhibit 88, being Declaration of Intention of New River Development Company dated June 25, 1925, having earlier been offered by plaintiff for a limited purpose, was offered in evidence by defendant for all purposes.)

(Exhibit 90-A, being maps accompanying Application for License dated August 30, 1936, having earlier been offered by plaintiff for a limited purpose, was offered in evidence by defendant for all purposes.)

(Exhibit 568, being letter dated July 1, 1925, from O. C. Merrill, Executive Secretary of Federal Power Commission, to Mr. C. Bascom Slemp, was offered in evidence as a part of the course of the proceedings between defendant and the Federal Power Commission.)

(Exhibit 569, being letter dated July 3, 1925, signed by C. B. Slemp and addressed to O. C. Merrill, Executive Secretary of Federal Power Commission, was offered in evidence as a part of the course of proceedings between the defendant's predecessor, and the Federal Power Commission.)

(Exhibit 570, being letter dated October 24, 1925, addressed to Federal Power Commission and signed by Curtis, Mallet-Prevost, Colt & Mosle, was offered in evidence to show part of course of conduct by defendant's predecessor.)

(Exhibit 571, being letter dated October 24, 1925, addressed to Major General Harry Taylor, Chief of Engineers, War Department, and signed by Curtis, Mallet-Prevost, Colt & Mosle, was offered in evidence as a part of the proceedings between defendant and plaintiff.)

(Exhibit 510, being letter dated February 5, 1927, from Major Trippe to F. W. Scheidenhelm, was offered in evidence.)

(Exhibit 511, being letter dated February 4, 1927, from F. W. Scheidenhelm to Major Trippe, was offered in evidence.)

2351 Mr. Abbot. On day before yesterday notice was given for the making of the motion with reference to the taking of the deposition of Colonel Ardery.

(The motion was duly filed.)

Mr. Abbot. I have an order which I desire to present on that motion, which is as follows:

ORDER

"The defendant, pursuant to Federal Equity Rule 47, having filed its verified motion for the purpose of taking the deposition of Lieutenant Colonel E. D. Ardery, Engineer, Fifth Corps Area United States Army, Fort Hayes, Columbus, Ohio, and good and exceptional cause having been shown by the defendant for the taking of said deposition at the time and place hereafter set forth.

"It is ordered that the defendant be and it hereby is authorized and permitted to take the deposition of said Lieutenant Colonel E. D. Ardery before Kenneth L. Sater, a Notary Public, in and for Franklin County, Ohio, at the office of Sater & Sater, 50 East Broad Street, Columbus, Ohio, on August 28th, 1936, beginning at 11 o'clock in the fore noon of said day with respect to the following matters:

"(*a*) Whether or not power waves from the Byllesby and Buck Hydro Stations during the years 1927–30 caused any interference with navigation on or the navigable capacity of the Kanawha River.

"(*b*) Whether or not during the power wave test conducted during March 1930 there was interference with navigation on or the navigable capacity of the Kanawha River and whether or not there was interference with the operation of the navigation works, and

"It is further ordered that the defendant be permitted to apply to the United States District Court for the Southern District of Ohio, Eastern Division or to such proper officer as the defendant may be advised for a subpoena to compel the attendance of said Lieutenant Colonel E. D. Ardery at the time and place aforesaid."

The **Court**. That is for Friday, is it?

Mr. **Abbot**. Yes, sir. Lieutenant Colonel Ardery has stated that he will give his deposition on that day.

(Above mentioned Order was signed by Hon. John Paul on August 26, 1936.)

Mr. **Thompson**. If the Court please: Yesterday your Honor entered an order permitting the taking of the deposition of Colonel Ardery, at Columbus, Ohio.

I have consulted with my associates since the adjournment last evening, and learn that the trip is about a thousand miles, going and returning, and I may say that so far, at this stage, we do not know how Colonel Ardery would answer the two questions that are to be propounded to him under the order—that is, the questions A and B—but in order to avoid taking this trip, and in view of the fact that our position has been that there was no evidence introduced to show that the wave from Buck and Byllesby dams did affect navigation down the river, but that they were introduced to show how the wave went down the river and how far it went, we are prepared to stipulate, although, as I say, we do not know how he would answer, we are prepared to stipulate that with regard to A as follows: That Col. Ardery would testify that the power waves from the Byllesby and Buck dams, from 1927 to September, 1930, inclusive, did not cause any interference with navigation on or the navigable capacity of the Kanawha River.

We are further willing to stipulate as to B that, during the test of the power waves in March 1930, that Col. Ardery will testify that there was no interference with navigation on or the navigable capacity of the Kanawha River. and there was no interference with the operation of the navigation works.

I have read the two questions which are to be propounded to him. We would, of course, want it understood that we are not by this
statement (the Government is not) admitting that those
2353 waves did not affect navigability or navigation down the
Kanawha River, and we are offering this stipulation on the condition that we will not have to take the deposition.

Mr. **Jackson**. Of course, I would want it stipulated further that Lieutenant Colonel Ardery was, at the time (that is 1927–30) and at the time of the power wave tests in March 1930, the District Engineer of the Corps of Engineers of the United States Army in charge of the Huntington District and in charge of the Kanawha River and navigation works on the Kanawha River and their operations, and also on certain parts of the Ohio River.

Mr. **Thompson**. This does not go to the Ohio River. It runs to the Ohio, but does get in it.

Mr. **Jackson**. The Huntington District includes to the mouth of the Kanawha and a certain distance down the Ohio River.

Mr. **Thompson**. We will agree to that, but we also want it understood and agreed to that Colonel Ardery was District Engineer and was there during all of this period that he speaks of.

My associates suggest that we are willing to stipulate that he was District Engineer during the time the official records show that he was such.

Mr. **Jackson**. We haven't official records, but we are stipulating that he was District Engineer during that time.

Mr. **Thompson**. What time?

Mr. **Jackson**. 1927–1930, inclusive, and particularly during the period of March, 1930, when the so-called tests were made with waves from the Buck and Byllesby plants.

Mr. **Thompson**. Will it be understood that his duty there expired in September, 1930?

Mr. **Jackson**. Sometime in September; yes.

2354 Mr. **Thompson**. We stipulate that, your Honor.

Mr. **Jackson**. And that these tests in March, 1930, were made in cooperation with his office as District Engineer?

Mr. **Thompson**. Do you mean cooperation with the defendant?

Mr. **Jackson**. Yes; and others, and, so far as that is concerned, that he cooperated in making the tests.

Mr. **Thompson**. All right, we will stipulate that.

Mr. **Abbot**. Shall that be put in the form of an order? I did not mean that there would be an order, but I think the record had better be read back.

Mr. **Jackson**. I think it can be read back, or checked so if there is any error we can correct it.

The **Court**. Will you please read it back?

Note.—The above was then read back.

Mr. Thompson. I would like to expunge from the record the motion that was made. The order is sufficient, it seems to me, to tie in the stipulation.

Mr. Jackson. It is all a part of the record, Mr. Thompson.

Mr. Thompson. I know, but we are not admitting any part of that.

The Court. I do not see any reason why it should be expunged from the record. It has been a part of the proceeding of the Court. If there is an appeal, or anything of that sort, you gentlemen might want it in the record, but we can omit any immaterial matters, but I think the record of this Court should show everything that happened.

Mr. Thompson. We are not conceding any of the statements set forth in the motion.

The Court. No.

(Exhibit 573, being defendant's Exhibit 505 identified by Col. Edgerton as part of the minutes subsequently printed as the minutes of the meeting of the Federal Power Commission of June 1, 1927, was offered in evidence.)

(Exhibit 574–a, being letter of July 1, 1927, from Federal Power Commission to Curtis, Mallet-Prevost, Colt & Mosle, was offered in evidence.)

(Exhibit 574–b, being certified copy of the minutes of the 38th Meeting of the Federal Power Commission held on June 1, 1927, was offered in evidence.)

(Exhibit 574–c, being form of major license tendered for project on navigable waters by Federal Power Commission to Appalachian Electric Power Company, was offered in evidence.)

(Exhibit 575, being a letter dated March 1, 1928, to Hon. Dwight F. Davis, Secretary of War, Hon. Hubert Work, Secretary of Interior, Hon. William N. Jardine, Secretary of Agriculture, constituting the Federal Power Commission and signed for Appalachian Electric Power Company by Curtis, Mallet-Prevost, Colt & Mosle was marked for identification. Inasmuch as said letter was set forth in the Eighth Annual Report of the Federal Power Commission, contained in Exhibit 91, the defendant did not offer the document marked Exhibit 575 for identification but instead was granted leave to refer to the text of Exhibit 575 in Exhibit 91 as though the document originally marked Exhibit 575 for identification had been offered in evidence.)

(Exhibit 529, being letter dated February 4, 1930, from Appalachian Electric Power Company, by Curtis, Mallet-Prevost, Colt & Mosle, to Federal Power Commission, re minor part license, was offered in evidence.)

(Exhibit 530, being memorandum dated February 4, 1930, re minor part license, prepared by Curtis, Mallet-Prevost, Colt &

Mosle, was offered in evidence, for the purpose of showing what the memorandum was which accompanied Exhibit 529, and to show what kind of an application Appalachian Electric Power Company was making.)

ebruary 24, 1932, to Chief of Engineers, was offered in evidence.)

(Exhibit 509, being letter from Secretary of War dated
ebruary 25, 1928 transmitting report from the Chief of Engi-
eers on preliminary examination and survey of Kanawha River,
Vest Virginia, House Document No. 190, 70th Congress, 1st
ession, 1928, was offered in evidence.)

(Exhibit 586, being letter dated September 18, 1934, to Secre-
ary of War, and signed by Appalachian Electric Power Com-
any, was offered in evidence to show position and intent of and
ction taken by the defendant.)

(Exhibit 587, being letter dated October 9, 1934 to Appalachian
Electric Power Company, and signed by G. H. Dern, Secretary
f War, was offered in evidence.)

(Exhibit 588, being letter dated October 18, 1934, from Appa-
chian Electric Power Company to George H. Dern, Secretary
f War, was offered in evidence to show position and intent of
nd action taken by the defendant.)

(Exhibit 589, being letter dated September 18, 1934 to Frank R.
IcNinch, Chairman of Federal Power Commission, signed by
ppalachian Electric Power Company, was offered in evidence
show position and intent of and action taken by the defendant.)

(Exhibit 590, being letter dated October 19, 1934 to Frank R.
IcNinch, Chairman of Federal Power Commission, from Appa-
achian Electric Power Company, was offered in evidence to show
osition and intent of and action taken by the defendant.)

(Exhibit 591, being letter to M. F. Millikan, American Gas & Electric Company, signed by G. W. Lineweaver, dated October 23, 1934, was offered in evidence.)

(Exhibit 572, report of General Taylor, Chief of Engineers, dated December 29, 1925 to O. C. Merrill, Executive Secretary of Federal Power Commission, having previously been received in evidence for a limited purpose, was reoffered and received in evidence for all purposes.)

2355 S. M. Yarbro on Direct Examination testified as follows:

I live at Charleston, West Virginia. I am assistant construction engineer for the Kanawha Valley Power Company. I am at present occupied at Winfield, West Virginia.

I took some photographs on New River, on June 2nd, 1936. I didn't take them myself, but I accompanied the professional photographer. The photographer's name was Mr. R. Nunnally. Those photographs were taken on June 1st, 2nd, and 3rd, at Goodwin's Ferry, above Eggleston, Virginia; Round Bottom Creek, above Glen Lyn. The photographs on June 1st were taken from Glen Lyn to Round Bottom Creek. On June 2nd the majority of the photographs were taken from Narrows, Virginia, to Ripplemead, Virginia. On June 3 the photographs were taken from Eggleston, Virginia, to Pembroke.

Q. Mr. Yarbro, I hand you an album marked "Defendant's Exhibit No. 592," in which there appears a map showing the locations of certain photographs by number, and a series of photographs from 61 to 113, both inclusive, and I will ask you if those are the photographs which you have just mentioned?

A. Yes; they are.

Q. Does each one of those photographs fairly portray the situation that appears at the place and time mentioned under the bottom of these photographs?

A. Yes.

Mr. Abbott. If your Honor please, I now offer in evidence "Defendant's Exhibit No. 592," and with reference to the map in the beginning of it I will state that it is not being offered as evidence as to the State or County lines. That is all we wish to ask. (Exhibit 592 introduced in evidence.)

The witness on Cross-Examination testified as follows:

I was present when all of these photographs were taken. We took them on June 1st, 2nd, and 3rd and some on June 29th also.

I was instructed to take the pictures by my immediate 2356 superior. I believe he said that they were to be used in this suit. We went back on June 29th, because some of the pictures that we took on June 1st, 2nd, and 3rd were not very good, and we took the same pictures over again. I do not recall which ones were not good.

Q. What was the instruction that you had about taking the pictures?

A. Well, I was instructed to take pictures of the Rapids and falls between the points I have mentioned.

Q. The rapids and the falls?

A. Yes, sir.

Q. And they did not tell you to take any pictures of the pools?

A. No, sir.

Q. So what you did was to take pictures which would detail as much as possible the rapids and falls?

A. That is correct.

Photograph No. 111 is one we took on the 29th of June. I do not believe that we had taken that particular scene before. I was not sent back because I had missed scenes or views. They sent me back because some of the pictures did not show clearly; some were sun struck or light struck. They did not show the condition of the river. This picture (No. 111) was not taken before, because we missed this part of it. In driving down the road in an automobile we did not see it. I believe we removed all the pictures that were light struck. I selected the sites which I photographed. I had lived in the vicinity about ten years, and I know the river along in that section.

Q. What was the condition of the river when you took the photographs on June 1st, 2nd, and 3rd?

A. In the elevation of the river?

Q. Yes; the elevation of the river?

A. It was considered normal.

Q. Normal?

A. Normal elevation.

Q. Do you mean by "normal low water" the average flow?

2357 A. Average flow.

Q. Average flow?

A. Yes, sir.

Q. Did you learn that simply by observation, or did you happen to look up the gage station records?

A. Gage station records.

Q. And what was the flow say at Round Bottom Creek on June 29th?

A. I can tell you what it was at Glen Lyn steam plant of the Appalachian Electric Power Company. I can give the elevation of the river.

Q. What was it?

A. 1492.5. I believe that is the elevation, but I can't say positively.

Q. What was the stream flow?

A. I don't know what that was.

By the COURT:

Q. Where was that point?

A. That was at Glen Lyn Steam Station.

By Mr. THOMPSON:

Q. What is the number of your picture at Glen Lyn?

A. We don't have one right at Glen Lyn.

Q. What was your nearest to Glen Lyn? 97 or 8, they say; have you got those?

A. Yes, sir.

Q. You say you don't know what the second feet in flow was at that time?

A. No, sir; I do not.

Q. So really your statement about the amount of water in that river is simply your estimate by eye, isn't it?

A. My statement about the amount of water in the river meant that the elevation of the river on those days was what was considered normal by the Government gage. There is a gaging station at Glen Lyn.

Q. Did anybody say that that was the normal, or is that something you have learned?

A. Well, I understand that that elevation is fixed as normal flow by the Government.

2358 Q. And who in the Government told you that?

A. Well, I was informed that that was considered normal by the officials of the plant.

Q. That is hearsay. The officials of the plant?

A. Yes, sir.

Q. And the plant is the plant of the Appalachian Electric Power Company, isn't it?

A. Yes, sir.

Q. You did not attempt in all instances here to get the full river; what you were trying to get was shoals?

A. That is it.

Q. Were you taking just cross river views?

A. We took them from the best angle.

Q. From the best angle to show up the shoals?

A. Yes, sir.

I live at Charleston, West Virginia. I lived at Glen Lyn on New River from 1925 to 1931. From 1931 to 1934 I was at Narrows.

The condition of the river on June 2, 1936, when Photograph No. 61 was taken, was the same as the condition that prevailed when the other photographs were taken. I would say that this photograph was made about 3:00 in the afternoon. When Photograph No. 62 was taken we were standing on the bank of the river but the photographer had his camera elevated too high to get the bank. I think he had a Graflex camera.

The witness, recalled for further Cross Examination, testified as follows:

I covered a distance of about 36 miles in taking these pictures on the river. I never counted the number of shoals we took pictures of.

Q. Do you know what the distance was that the shoals covered of the 36 miles?

A. How is that, now?

Q. The distance up and down stream that those shoals covered of the 36 miles?

2359 A. No, sir; I do not.

Q. If I were to say it was five miles out of 36, would you agree with that?

A. I really have no information at all on that.

Mr. Abbot. I object to the question. The witness says that he doesn't know.

The Court. Objection overruled.

Mr. Abbot. Exception.

By Mr. Thompson:

Q. Would you not say that it was over five miles?

A. I merely had these pictures taken, but I have never measured the distance and have no idea at all what distance they cover.

Q. And you took the worst conditions of the river in the 36 miles, didn't you?

A. Well, I took the shoals and the rapids.

Q. And they are the worst conditions in the river, are they not?

A. What do you mean by "the worst conditions?"

Q. I mean the obstructions on the river—the greatest obstructions in the river or in that section?

A. Yes, sir.

I did not notice any channel in the river when I took photographs Nos. 61, 62, 63 and 64. Those pictures, Nos. 61, 62 and 63, were taken near Eggleston, Virginia.

Photographs Nos. 62, 63, 64, are all at about the same place in the river.

Photographs Nos. 65, 66, 67, 68, 69, 70 and 71, inclusive, were all taken within a distance of about a mile. They were not all taken of one shoal. There is a shoal for each picture except 69 and 70 are of the same shoal.

Q. What do you mean by a shoal?

A. Well, it is swift water, where water falls over an obstruction, such as projecting rocks.

Q. It is more than one particular ledge running across the river, isn't it?

A. It could be.

Q. Haven't you a series of ledges within a very short distance, that are practically all one shoal?

A. These pictures you have referred to are within a radius of about a mile, and that is all swift water in there.

2360 Q. They were taken about as closely as they could be taken, in order to get different views of the river?

A. Well, they were taken to show these shoals up to the best advantage.

Q. And by "the best advantage" you mean by showing them up as outstanding as possible, do you not?

A. Well, when we took these photographs we attempted to show the river as nearly the true condition as we could. I would not say that we tried to show the river as rough as possible, but tried to make a true picture.

Q. You were trying to make a true picture of the shoals?

A. Yes, sir.

Q. And that was the roughest part of the river at that particular place?

A. Yes, sir.

Q. And you said yesterday, I believe, you were not trying to take pictures of the pools above and below?

A. No; we paid no attention to those.

72, 73 and 74 are not of the same place exactly. They follow one after the other. 72, 73, 74 and 75 are from 4.1 miles below Eggleston to 4.7 miles.

Q. So you have a very close area there in which you took this series of pictures?

A. That is right.

Q. That is correct, is it?

A. Yes, sir.

Q. While you show these, are you familiar with the Hutton Survey?

A. No, sir.

Q. You don't know that the Hutton Survey shows that is only four-tenths of a mile instead of six-tenths, as you have it?

A. No, sir.

Q. Did you not know that the stretch where you were, or did you know that the stretch where you were taking pictures had been surveyed and that there was a channel there 16 feet 2361 wide, 2.3 feet deep? Let us take, for example, the reference back to Photograph No. 72: That looks like fairly rough water there, doesn't it?

A. Yes, sir.

Q. Did you know that there was a channel there 16 feet wide and 2.3 feet deep?

A. No, sir.

Mr. **Abbot.** We object to that question. There is no evidence in this record of any such channel.

The **Court.** I don't recall any testimony along that. He can answer it.

Mr. **Abbot.** Exception.

By Mr. **Thompson:**

Q. Did you know that there was a channel at No. 78 that is 30 feet wide and 3 feet deep?

Mr. **Abbot.** We make the same objection.

The **Court.** Overruled.

Mr. **Abbot.** Exception.

A. No, sir; I didn't know that.

By Mr. **Thompson:**

Q. And that the same condition existed at 79, 80, and 81?

Mr. **Abbot.** The same objection.

The **Court.** Where is the evidence of the present existence of a channel at that place?

Mr. **Thompson.** We have the testimony of Mr. Gerdes and those that went over it in a boat that there was a channel of this width and depth. They went there this summer and made the trip.

The **Court.** I remember that they made the trip, but I don't remember the other.

Mr. **Thompson.** Yes, sir. The answers to my questions were as to specific widths and depths, and that they actually measured the depths and got out in the water.

Mr. **Abbot.** If your Honor please, my recollection of Mr. Gerdes' testimony is not that he measured any channel lengthwise in the river, but when his experienced eye showed it was a critical point, then he measured across the river. There was no lengthwise measurement of any channel at any point.

Mr. **Thompson.** If there is any question about that we will have reference to his testimony.

The **Court.** Answer the question.

Mr. **Abbot.** Exception.

Note: The last two questions asked were read.

By Mr. **Thompson**:

Q. You didn't know that?

A. No, sir.

Photographs Nos. 78, 79, 80, and 81, inclusive, are located close to each other, they are not identical.

2362 Photographs Nos. 85 and 86 were taken of the same place on the river, but one is taken closer up than the other.

Q. I believe you testified yesterday that you were told by representatives of the Appalachian Electric Power Company, at Glen Lyn, that the stream flow on the days that you took these pictures was about normal?

A. That is correct.

Q. Do you know what they said the flow was, how much it was, on any one of those days?

A. Do you mean the elevation of the river, or second-feet?

Q. Second-feet?

A. I do not.

Q. Have you tried to find out since yesterday?

A. No, sir.

Q. Did you know that there was a variation in flow from 1700 to 2500 second feet during those days?

A. No, sir.

Q. There was not any storm on the river on those particular days, was there?

A. Not at the point where we took the pictures.

Q. You did not hear of any storm upstream?

A. No, sir.

Photographs Nos. 87, 88, 89, 90, 91, 92, and 93, inclusive, were all taken above Bluff City, and approximately within one-half mile of each other.

Photographs Nos. 103 and 104, were taken of the same spot in the river, 4.5 miles below Glen Lyn. 102 is not the same spot.

Photographs Nos. 109, 110, 111, and 113, inclusive, are all pictures of the river at Round Bottom Creek. There were indications that a Creek came into New River at Round Bottom, but there is no creek there now.

We took a great many photographs we didn't put in this Album.

Photographs Nos. 106, 107 and 108, inclusive, are views of 2363 Wylie's Falls, taken at practically the same place.

I have crossed the river several times in boats.

(Exhibit 250, being photograph No. 58 contained in album of aerial photographs of New River—exhibit 273 was marked for identification.)

(Exhibit 251, being photograph No. 56 contained in album of erial photographs of New River—exhibit 273 was marked for dentification.)

(Exhibit 252, being photograph No. 57 contained in album f aerial photographs of New River—exhibit 273 was marked or identification.)

I have heard the natives in the location of these pictures (107 nd 108) say that at certain points there were channels, but no ne has ever pointed out to me any channel there. If any chanel was there no one has ever pointed it out to me, and I could ot recognize it from looking at the river.

Defendant's exhibit 515 marked for identification is the same s No. 96 in Defendant's exhibit 592.

364 **HAROLD A. THOMAS**

Direct examination by Mr. JACKSON:

Q. Will you please state your full name and residence for the ecord?

A. Harold Allen Thomas. Pittsburg, Pa.

Q. What is your occupation?

A. I am a Professor of Civil Engineering at Carnegie Institute f Technology.

Q. Professor Thomas, will you please state what has been your ducation?

A. I spent six years at Columbia University, receiving the legree of A. B., in 1906, and Civil Engineer degree in 1908.

Q. State what has been your experience as a teacher since your raduation from Columbia University?

A. I spent a summer as instructor in Columbia University Surveying School. I taught a year and a half as instructor in Civil Engineering at the University of Washington, Seattle, Washngton.

From 1910 to 1923 I was Professor of Civil Engineering at Rose Polytechnic Institute, Terre Haute, Indiana.

Q. What were you in charge of at Rose Polytechnic Institute?

A. Civil Engineering courses, and among them courses in ydraulics and Hydraulic Engineering.

Q. Will you proceed?

A. Since 1923 I have been Professor of Civil Engineering at Carnegie Institute of Technology, Pittsburgh, Pa.

Q. Will you state what, if anything, your duties as Professor f Civil Engineering at Carnegie Institute of Technology had to lo with hydraulics or hydraulic engineering?

A. I have charge of all courses in Hydraulics and Hydraulic Engineering, which includes the graduate courses in Hydraulic Engineering and the courses in Advanced Hydraulics.

2365 Q. Does that include Water-Power Engineering?

A. Yes, sir; that includes Water-Power Engineering. I am also in charge of the Hydraulic laboratories.

Q. Outside of your work as a teacher of Hydraulic subjects, have you had any experience in engineering of a hydraulic character?

A. I have had a considerable amount of experience of such kind.

Q. Will you briefly indicate something of your experience in engineering work outside of your teaching activities?

A. During the fall and early winter of 1908 I was a member of the Engineering Corps of the New York State Water Supply Commission, engaged in surveys for water power and flood protection on the Genessee River, New York State.

During the summer of 1918 I was Assistant Engineer of the Corps of the Great Northern Railroad, at Monroe, Washington, where a part of my duties were to make investigations of flood heights along the Snoqualmie River, Washington.

Q. Will you proceed?

A. In the years 1914 and 1915 I was Consultant for the Pennsylvania Railroad, in connection with damage from floods arising in the Wabash River and White River Valleys in Indiana.

During the summer of 1918 I ws Assistant Engineer of the Miami Conservancy District, Dayton, Ohio, where my duties were to make computations on the hydraulic behavior of the flood retarding reservoirs, and to prepare a report on the hydraulic features of the flood protection system for Dayton, Ohio, and other cities in the Miami Valley.

In 1927 I was Consulting Engineer for the City of Pittsburg on studies having to do with the design of walls along the river front to protect the city from floods, and I made studies to determine how the construction of those walls would affect flood water heights in the Pittsburg District.

2366 During the summer of 1928 I served as senior engineer in the U. S. Engineer office of the War Department at Philadelphia, Pa., having charge of a survey and investigation of the water resources of the Delaware River, for future embodiment in the so-called 308 report.

Beginning 1928 I served as Consulting Engineer for the Flood Commission of Pittsburg. That engagement has continued to the present time. My principal duties have been to advise the Flood Commission on matters pertaining to flood protection of the Pittsburg District, and particularly to review and report on studies of flood protection made by the U. S. engineers.

Q. That covered what different rivers?

A. Alleghany, Monongahela and Upper Ohio River below Pittsburg.

About 1928 I established the Hydraulic Research Laboratory at Carnegie Institute of Technology, and since that time that Laboratory has carried on a great many investigations by means of models to study the action of various hydraulic structures, particularly dams, spillways and river navigation structures, such as locks and dams. During that time the structures we have investigated have included some of the largest structures built in the United States in recent years.

Q. Has your work outside of your teaching included any work for the Corps of Engineers of the U. S. Army along hydraulic lines?

A. We have done a great deal of work in the Laboratory for the Corps of U. S. Engineers. They maintain an office at Carnegie Institute of Technology where they have six men at present cooperating with my men on studies of various structures.

Q. Has that got to do with hydraulics?

A. Yes, sir.

2367 Q. Will you name some of the U. S. Engineering offices for which you have done work as Hydraulic Consultant?

A. The Philadelphia office, the Pittsburgh office, the Huntington, West Virginia, office, the Mobile, Alabama, office and the Panama Canal Zone.

Q. Have those studies anything to do with currents in connection with structures in the rivers?

A. We have made a number of studies to determine the best method of eliminating or controlling dangerous cross currents in the vicinities of the entrances to locks at navigation dams on rivers.

By Mr. Jackson:

Q. Please state a few of the navigation structures in regard to which you have made hydraulic studies of the character you have described.

A. We have made such studies on Lock and Dam No. 4, on the Monongahela River and Lock and Dam #9, on the Alleghany River; the Gallipolis Dam now under construction on the Ohio River; the New Emsworth Dam on the Ohio River, six miles below Pittsburgh, and we have made certain studies involving navigation at the Tuscaloosa Dam on the Warrier River in Alabama.

Q. In the course of those studies have you inspected or studied the actual operation of navigation locks and dams?

A. Yes, sir; I have had occasion to visit various locks and dams and in certain cases to make detailed surveys to show the direction and velocity of river current in the approaches to the navigation locks. I have also had occasion to observe the action of boats or tows moving in and out of locks, to determine how these were affected by river current.

Q. You stated you had studied, among other structures, the Gallipolis Dam. For what engineering office, if any, did you make that study?

2368 A. The Huntington office.

Q. Have you carried on any other studies of structures, involving hydraulic structures, for the Huntington office?

A. Yes, sir.

Q. Please state what they are.

A. During the past eight months we have been making very intensive studies of a number of models for the Bluestone Dam on the New River.

Q. Are you employed in any capacity with respect to the Bluestone Dam or the design of it?

A. Yes, sir; in addition to being in charge of the model studies at that dam, I am consulting engineer on the hydraulic design.

Q. Professor Thomas, are you the author of any technical or scientific articles on engineering subjects?

A. I have written a number of technical articles for engineering magazines.

Q. Can you name a few of them?

A. The Back Water Curve, published in Rose's Technic, back in 1915.

By Mr. **Thompson**:

Q. Is that a school or college?

A. Yes, sir; that was a school. I have also written short articles on methods of computing outflow from retarding reservoirs.

By Mr. **Jackson**:

Q. Did you have anything to do with any report on the Miami Conservancy District?

A. I prepared the original manuscript for the technical report of the Miami Conservancy District on the subject of "Hydraulics of the Miami Valley Flood Control System."

I prepared the report of the Pittsburgh Flood Commission reviewing the 1928 report of U. S. Army Engineers on Flood Protection for the Pittsburgh District.

2369 I am the author of a bulletin published by the Carnegie Institute of Technology on "Hydraulics of Flood Movements in Rivers."

Q. Are you a member of any professional or scientific society?

A. I am a member of the American Society of Civil Engineers; I am a Fellow of the American Association for the Advancement of Science; and I am a member of the Society for the Promotion of Engineering Education.

Q. Professor, have you any specialty in the field of hydraulics?

A. I have specialized in unsteady flows, irregular and fluctuating flow of water, particularly in rivers, and other open channels, studying such things as flood movements, flood waves or power waves or power tides, as we call them.

Q. What do you mean by river tides?

A. A condition in which the flow of the river increases and decreases alternately rather slowly. Though it is sometimes called river waves I think the term "tide" is more appropriate because the rise is gradual and the fall is gradual; because the thing resembles an ocean tide very much more than it resembles an ocean wave; for example, power tide in the river usually has a period of 24 hours, rising slowly and then receding slowly.

Q. Will you state a little more particularly what has been the nature of your specialization in connection with these river tides or fluctuating movements?

A. For many years I have been interested in the mathematical theory of unsteady flow in rivers and other open channels, and have done a great deal of work to develop mathematical methods of studying such action. I have also done a great deal of work studying the possibility of investigating such action by means of models, and I might say at the present time that the use of models is becoming a recognized method of solving all problems which are too intricate to be solved by strictly mathematical methods.

2370 Q. Have you employed these various methods, mathematical and model, in hydraulic work?

A. Yes, indeed; I employed both methods extensively.

Q. Are you familiar with the Kanawha River?

A. I have visited the Kanawha River, or the portion of it between Charleston and the mouth of Cauley River, particularly in the vicinity of the London and Marmet Dams.

Q. On those visits, have you observed any hydro-electric plants?

A. Yes, sir; I have visited the Marmet and London hydr'-electric plants, spent considerable time in each plant, observed the method of operating the plant, and observed the automatic gauges which record the water level in the forebay, and tailrace, of those plants.

Q. Are you familiar with the hydraulic conditions along the Kanawha River between Charleston and Kanawha Falls, and the methods for observing or measuring the hydraulic behavior of the river?

A. Yes; I have had an opportunity to inspect the various maps of the Kanawha River and to see the rating curves and rating tables at the various gauging stations, and those are the principal things that would affect the hydraulic characteristics of the river.

Q. What did you say about the rating tables, or what about them?

A. I have seen data on discharge of river, both in the form of rating curves and rating tables.

Q. Have you at any time made any examination or inspection of the original chart of the automatic gauges?

A. Yes; I have inspected those charts of the automatic gauges for various periods during the past few months.

Q. Have you inspected any original records of Lock Gauges at any navigation locks and dams?

A. Yes, sir; I visited the dams at Marmet and London and observed the operation there personally.

2371 Q. Have you any acquaintance with New River?

A. I visited the Radford dam site and then visited various other portions of New River, such as I could reach by automobile, from Radford dam site to the mouth of the river.

Q. Did those portions of the river which you visited include Glen Lyn region or not?

A. Yes; I traveled by automobile from Glen Lyn down the bank of the river as far as Hinton.

Q. What, if anything, did your inspection and study of the Kanawha River and New River have to do with the present suit?

A. As far as the Kanawha River is concerned, I visited it on account of the present suit. In connection with New River I visited it both in connection with the present suit and because of my interest in the hydraulic design of the Bluestone Dam.

Q. Have you ever had occasion to visit New River in connection with the Bluestone?

A. No, sir; this was my first visit in that connection.

Q. Was your visit to the Bluestone Dam in connection with this suit or in connection with some other employment?

A. The trip was made for both reasons, to inspect in connection with this suit and also at the authority of Col. Conklin, to inspect the site of the Bluestone Dam.

Q. Who is Col. Conklin?

A. He is the District Engineer in the Huntington District.

Q. You mean of the U. S. Army Engineering District?

A. Yes, sir.

Q. Will you describe briefly the methods which are accepted and employed in determining river flow conditions?

A. The best method of studying river flow conditions is by means of tests on the actual river, if it is possible to make 2372 such tests. If conditions are such that it is impossible to make actual tests, one can have resort to mathematical methods; but in general those methods are apt to be so cumbersome and intricate as not to be workable. That is particularly true in the case of steep rivers, and when studying waves of duration as short as a day under those conditions it is almost impossible to solve the problems in a satisfactory way by a purely mathematical method on account of the great amount of labor and the great length of time involved in getting results.

Another method of studying such problems is to construct natural scale models of the river, showing all the curves and ledges. That method is not very satisfactory in the case of a river such as New River, because the model has to be extremely long, or if the model is made shorter it has to be excessively shallow.

Another method of studying such action is to construct what we call an integrating model which does not show curves and all details of the river and yet shows the fundamental hydraulic action in such a way as to satisfy mathematically the requirements. It might be called a simplified model of the river which is used for solving mathematical equations of flow in the river.

Q. Does that method combine the mathematical method and the model method?

A. Yes, sir; I should say so.

2373 Q. Have you read the testimony of the plaintiff's witnesses in this case in regard to the so-called power waves, such as Mr. Kramer and Col. Watkins?

A. Yes; I have read that testimony.

Q. On the subject of so-called power waves or tides, do you use the same terminology as that employed by the plaintiff's witnesses, or perhaps you might briefly define the terminology that you use, so that your testimony will be clear.

A. I think I am in substantial agreement with their terminology, but I also use other terms which they did not include, and I would like to have an opportunity to explain those terms at the present time by making a sketch, if I may.

Q. Will you proceed and briefly explain the terms you use in these hydraulic matters in regard to the so-called power waves or tides?

A. This curve would represent what I call a hydrograph of the power tide curve, in which vertical distances represent flows in cubic feet per second, and horizontal distances represent time. The discharges are measured above the line of zero flow, which I can mark zero.

By Mr. Thompson:

Q. Will you finish stating the terms that you wish to use that these other witnesses did not?

A. One term I used is called hydrograph, as it describes that type of curve.

By Mr. Jackson:

Q. Go ahead.

A. The line connecting the lowest points of the two troughs of the tide I call the base flow line, B–B. I consider that a straight line, although my sketch shows it a curve.

By Mr. Thompson:

Q. Are you going to give the vertical there?

A. Yes sir. By amplitude of the tide I mean the length of the vertical line A—drawn from the crest of the curve to the base flow line. By volume of the tide, I mean the area of 2374 the curve above the base flow line, or the shaded area. By the average or mean flow line, I mean line drawn parallel to the base flow line, and I will letter the mean flow line M–M. It is drawn in such a way that the area between lines M–M and B–B, between the trough of the waves is equal to the volume of the tide above the base flow line. In other words, the mean flow line is drawn in such a way that the volume of the wave above the mean flow line would fill in the volumes of the troughs between the mean flow line and the base flow line.

Q. Is that on both sides or one side?

A. On both sides, the combined volume of both half troughs. I think that is all I need show on this sketch.

By Mr. Thompson:

Q. You have not given your vertical ordinate?

A. It is line A—which I call amplitude of the wave.

By Mr. Jackson:

Q. I will ask the reporter to mark the sheet of paper upon which Prof. Thomas has drawn the sketch referred to in his testimony as Defendant's Exhibit 593.

(Said sketch, exhibit 593 offered in evidence.)

By Mr. Thompson:

Q. That mean flow line, is that the average flow line?

A. Yes, sir.

Q. Instead of the mean flow line?

A. I can use either the average flow line or the mean flow line interchangeably.

By Mr. **Jackson**:

Q. You said there was some other term that you wanted to explain.

A. I also in my testimony would like to use the word "seiche" to describe fluctuations in reservoir or pools, or rather to describe the periodical fluctuations or oscillations in the surface of the reservoir or pool.

Q. What is the relation between the term "seiche," as you use it, and the term "oscillation" as was used by some of the Government Witnesses, if any?

A. I think it signifies the same thing, but the term "seiche," is a recognized technical term to describe oscillation in a large body of water.

2375 Q. Do you draw any distinction between variations in a power tide and an oscillation or seiche?

A. Yes, sir; in a seiche in a pool or reservoir, the ends of
the pool or reservoir are raised alternately, in a manner
2376 which is analogous to the oscillations which occur in a
plate of soup when it is tipped. That analogy is rather
helpful in describing what is meant by seiche. Another term
which I would like to use——

Q. (Interrupting.) May I ask you this: Will you state whether the variations in a power wave are above or below the average line or flow?

A. The variations of a power wave may be considered to be above or below the line of average flows. Those variations may be roughly one-half the amplitude of the waves.

By Mr. **Thompson**:

Q. Is that a universal rule?

A. I should say that is a simple definition of the use of the term.

Q. I mean does it have a general application?

A. Yes, sir. Another term which I should like to define is the volume of the crest of the wave.

By Mr. **Jackson**:

Q. Will you proceed to define it?

A. The volume of that portion of the wave which lies above the mean flow or average flow line, is the volume of the crest of the wave. It is that portion which would have to be removed by a reservoir which would regulate the wave so as to dampen off the irregular flow in the river. The volume of the crest is normally equal to the volume of the two half troughs, which would correspond to the volume of the reservoir required to dampen out the waves.

Q. Can you on the sketch that has been marked Defendant's Exhibit 593, put a cross-hatching in some fashion on the particular part of the wave which you have described as the volume of crest and indicate what would have to be removed from the wave in order to regulate it or iron out the irregularities, and show where that would be put?

A. What I have defined as the crest of the wave, is the part which I am double hatching.

Q. Will you double hatch the part of the trough into which that volume of the crest would be put in case of reregulation?

(Witness does so.)

2377 Q. Now for the record, will you state whether or not the portions of the trough which you have cross hatched lie between the line M–B, and below the line M–M, and the outline of the base of the wave?

A. Those two cross-hatched areas which you have just described, represent the volume of reservoir required to completely take the crest off the waves and produce uniform flow in the river.

Q. What I wanted to know is, for the record, whether my description of those cross-hatch areas on Exhibit 593 was correct?

A. Yes, sir; that is correct.

Q. Was your purpose in drawing that sketch to make the volume of crest equal to the two cross-hatch one-half troughs below the line M–M?

A. Yes, sir; that is the principle used in drawing the mean flow line M–M.

Q. Will you state generally what is the relationship between the height of a power tide or wave and its length, that is, some general description, of what is the length and height of a power tide generally?

A. A power tide usually lasts for 24 hours, and in the New River their velocities are in the vicinity of three or four miles an hour: if the velocity was three, the tide would be 72 miles long, and the height of it might be a few feet or a few inches. The tides passing Kanawha Falls are usually a few inches in height and about 70 miles long.

By Mr. Thompson:

Q. Are you referring now to the Buck and Byllesby waves?

A. Yes, sir.

By Mr. Jackson:

Q. Some time ago when I asked you about your observations on the Kanawha River, you stated you had observed the operations of the London and Marmet hydro station, of the Kanawha Valley Power Company. Will you please state in a little more detail what was involved in those observations?

2378 A. Those observations were made on August 14 and 15th of this year, and on those days the power plants at London and Marmet were operated under special conditions at my direction to produce a particular rate of increase and decrease of the flow of the river.

Q. At that time did you, in addition to observing the operation of the plant, make any study of the logs and charts?

A. Yes, sir; on those dates I visited the automatic gauges many times to study the fluctuations of the river level which were occurring at that time.

Q. Were these the tests that you were making?

A. Yes, sir.

Q. Describe the first tests that you made.

A. During the first test, the flow through the turbines of the London plant was regulated in loads so as to produce a power tide similar to tide No. 2 of the March 1930 series of tides, but with fifty percent greater amplitude. That test was of twenty-four hours duration.

Q. You say it was a fifty percent greater amplitude—is that amplitude in stage or in flow?

A. In flow.

Q. In second-feet?

A. The amplitude was approximately 4,100 second-feet.

Q. What was the relation between that and number two power tide in the 1930 series?

A. Number two tide in the 1930 series had an amplitude of just two-thirds of that.

Q. Proceed with the description of this test.

By Mr. GERDES. What was the volume of the 1930 wave?

2379 A. I don't have that computed except as to amplitude

By Mr. THOMPSON. You expressed the amplitude how?

A. In cubic feet per second.

Q. 4,100 cubic feet per second?

A. Yes, sir.

Q. That was in 1930?

A. No, sir; that was the actual test.

By the COURT:

Q. By that is it meant that that much water was released—4,100 second-feet, that the flow was increased that much?

A. Yes, sir; the water was partly released from the London pool or partly entered it at the upper end. They operated the plant so as to produce that flow in the pool according to that load throughout the twenty-four hours.

By Mr. **Jackson**:

Q. This relationship to wave No. 2 of 1930, was that the wave in your test was 150 percent of that wave as produced at Kanawha Falls, or in that vicinity?

A. Yes, sir.

By Mr. **Thompson**:

Q. That 4,100 second-feet, was that the difference between what entered the pool and what went out of the pool?

A. No, sir; that was the amplitude of the wave. That was a wave having an amplitude of 4,100 second-feet, approximately.

By Mr. **Jackson**:

Q. Tell us about the test, as to maintaining the pools.

A. It was operated in such a way as to maintain the pool between London and Marmet to satisfy Government regulations so as to allow for variations in the stage of that pool.

Q. What was the form of the outflow from Marmet?

A. The outflow from Marmet was very similar to outflow from London station. The pool between the two stations
2380 was maintained at as nearly a constant level as practicable.

Q. What was the relation between the outflow at Marmet station and No. 2 wave in the 1930 tests?

A. At the Marmet station, the water rose in the tail race during the test and then receded, giving a wave such as could be measured at Marmet.

Q. I am getting at this: What was the relation in volume between the wave or discharge at Marmet, and No. 2 wave of the 1930 tests, as it came down that part of the river?

A. It was fifty percent greater than the wave of the 1930 tests. The flow from Marmet was practically equal to the flow from London, because the pool was maintained at a practically constant elevation.

Q. What was the result of these tests at London and Marmet in respect to the navigation of the pools of the Kanawha?

A. I might say that our principal object in running the tests was to determine whether or not a wave could be employed to produce any seiches or periodic oscillations in the Marmet pool.

Q. And what did you find?

A. I found that there were no seiches in that pool which could be attributed to the waves that we ran. During the test there were minor seiches. The automatic gages—I might say
2381 that, during any period, the pencils of the automatic gages are continually moving indicating that minor fluctuations are constantly traveling up and down the surface of the navigation pools.

Q. What is the cause of these minor fluctuations?

A. The cause of these minor fluctuations are fourfold: they ay be due to lock operation—the discharge of the water from e navigation locks; they may be due to changes in the discharge rom the turbines of the power plant, as the turbines are started p or stopped, or as additional blocks of load are put on the urbines; they may be caused by the operation of the roller gates; nd they may be caused by gusts of wind.

Q. When you refer to taking off blocks of load on units of a ower plant, will you describe a little more fully what you mean y that?

A. These power plants are operated in such a way that it is ot feasible or convenient to increase the load of the unit slowly r gradually, but, if it is desired to change the load, it is changed y steps. In other words, they refer to that as taking off or utting on a block of load.

Q. Are these blocks large or small, in comparison to the total oad?

A. They are small as compared to the total load.

Q. When you refer to roller gates, are those the roller gates f the dam?

A. Yes, sir.

Q. Does the wind have any effect on minor oscillations?

A. Yes, sir; the wind has an effect on minor oscillations. I did ot complete my answer to your question. You asked me a uestion about the effect of the tests and I started to describe and nly completed part of the answer.

Q. Go forward, Professor Thomas, with your answer.

382 A. The tests showed numerous minor fluctuations, but showed no large fluctuations which could be attributed to the main wave. There were absolutely no seiches of such nature that corresponded to the periods of the main wave, or hat could be associated with the main wave, or main tide, in any ay. In regard to the minor fluctuations, I personally was in he gage house at a time when a boat passed through the lock nd I had a chance to see there that one of the oscillations of the age was caused by the boat coming through the lock—the eiche of water from the lock just after the—before the boat came ut of the lock. I also had a chance to witness the movement f the pencil after a load change was made in the turbine and aw that that particular oscillation was caused by the load change.

Q. Who operates the roller gates?

A. The Government.

Q. What was the total amplitude or vertical movement of these inor oscillations or fluctuations that you have mentioned?

A. Due to lockages, it was approximately 0.2 of a foot, in the test I witnessed, and in this test a seiche of 0.4 of a foot was caused by putting on a block of load at the London plant.

Q. Are any of these minor oscillations due to the power wave itself passing down the pool?

A. No, sir; they are absolutely not due to the power wave.

Q. What is the extent of the fluctuations that could be caused by roller gate operations?

A. It would be possible to cause a tremendous fluctuation by roller gates, if the roller gates were opened completely and simultaneously; they could cause a tremendous flood wave to travel down the pools.

Q. How would that compare with the potentialities of anything that could be produced by power stations?

A. Vastly greater than anything produced by power stations.

By the COURT:

You said that you noticed a minor fluctuation of 0.4 of a foot amplitude, resulting from putting on an extra load at the London plant? 2383

A. Yes, sir.

Q. That would create a fluctuation in the pool where?

A. Just below London; it was measured just below the plant at London.

Q. In the Marmet pool?

A. Yes, sir.

Q. Is that a power wave?

A. No, sir; that is not a power wave, in the sense of using the term power tide. It was a local fluctuation.

Q. Due to the discharge of an increased amount of water through the machinery at London, wasn't it?

A. Yes, sir. But that is not what I call a power tide. Power tides rise gradually over a period of several hours, and recede about in twenty-four hours. This was an almost instantaneous discharge of the local plant.

By Mr. JACKSON:

Q. Do minor fluctuations occur from the operation of any plant a considerable distance upstream from a given point?

A. No, sir; they could not occur from such a cause.

Q. Does it represent what could occur in the tail race of a power plant?

A. Yes, sir.

Q. Did you, during this test, observe the amplitude of the wave at the foot of Marmet Dam below the Marmet Power Station?

A. Yes, sir; I observed that on the record of the automatic gage.

Q. What was it?

A. It was about 1.3-foot rise.

Q. And you said that this amplitude in volume was 4,100 second-feet?

A. Yes, sir.

Q. And that compared how with wave No. 2 of the 1930 series?

A. That was fifty percent greater than wave No. 2.

2384 Q. When I said 4,100 second-feet volume, it should have been amplitude in second-feet. When the discharge out of Marmet Power Station was cut off, was there any resulting oscillation in Marmet pool approximateing this amplitude of 1.3 feet?

A. No; indeed.

Q. What did occur in—

Q. (Continuing.) I mean the discharge from London Station into Marmet was cut off.

A. During that test, the discharge of London Station was cut off, gradually, and no oscillations occurred in the pool from that.

Q. Have you completed the description of the first test?

A. Yes, sir.

Q. Did you make any other tests?

A. Yes, sir.

Q. Describe that test.

A. That was a test in which the operation of the London plant was suddenly stopped; in which the flow at London plant was cut off almost instantly.

Q. What was the volume of flow involved when it was cut off—the rate of flow?

A. It was about 3,800 second-feet—was dropped instantly.

Q. Are you sure that it was 3,800 feet?

A. I will have to refer to my notes on that (witness refers to papers). I looked at the records on the gage later on. It was 3,200 second-feet.

Q. Will you describe more fully what was the object of this test—what were you trying to determine?

A. I wanted to determine for my own satisfaction whether or not the sudden dropping of considerable load at that plant would produce a surge in the Marmet pool; in other words, to be certain whether or not some of these oscillations I witnessed in the pool were actually due to their sudden load changes in the plant.

2385 Q. You said "surge"—that is the same as seiches, is it?

A. Yes, sir.

Q. What were the results?

A. This sudden dropping of the load produced a definite surge, with an amplitude of .3 of a foot.

Q. Where was that?

A. Just below the London plant.

Q. Could such a seiche arise from a wave emitted from Radford?

A. No, sir.

Q. Why not?

A. The reason is that a wave emitted from Radford, by the time it reached the Marmet pool, would have its form changed, so that its rise would be very slow, occupying a period of several hours, probably from four to five hours, and that rise would be altogether too slow to produce any seiche in the Marmet pool.

Q. Does what you have said about Marmet pool apply to the London pool?

A. Yes, sir; both pools.

Q. Do these tests that you have described represent the reasonable typical conditions of the operations at the Marmet and London hydro stations?

A. I would say, with reference to the second test, that would not represent the typical conditions, in that the rate of the stopping of the plant was at a much more rapid rate than would have been done typically.

Q. Professor Thomas, does the concurrent operation of the London and Mamet stations, under any circumstances, produce a result different than would be produced by the operation of one plant alone, on the Kanawha?

A. Yes, sir; it is possible for the plants to be operated in such a way as to amplify the seiches.

Q. How would that happen?

2386 A. If the London plant were suddenly shut off, the water level below London would be lowered, and that would produce a negative wave which would travel down the river, and about an hour later would lower the water level at Marmet. If Marmet were suddenly started, with the load increased, it would lower the water level still more.

Q. The conditions have got to be concurrent?

A. Yes, sir; one superimposed on the other.

Q. Did you, in your test and study of the record, observe such a condition?

A. I observed conditions where I thought there was amplification of the waves, but I would not state that I could prove such amplification, because the time records of the automatic gages are not accurate enough to definitely prove that one surge amplifies another, but I consider that certain surges were caused by amplification.

Q. You took a time record, you say—do you refer to the clocks?

A. Yes, sir.

Q. I show you a copy of Government's Exhibit No. 229, which I would like for you to look at. (Hands paper to witness.) Now, you observe there a fluctuation on June 16th, 1936, according to that exhibit, do you?

A. Yes, sir.

Q. And have you any opinion as to the cause of that fluctuation?

A. My opinion is that that fluctuation was caused by the variations in the load at London and Marmet plants,—rather sudden variations.

Q. Have you any opinion as to whether or not this was caused by the simultaneous, or as the result of the concurrent operation of the two plants?

A. My opinion is very strongly that such is the case, but I have studied the records very carefully and I cannot prove it on account of the uncertainty of the time recordings of the automatic gages. 2387

Q. State from the exhibit the time when that seiche occurred and its extent.

A. It occurred at four o'clock P. M. on June 16th.

Q. May I substitute this so I can hand a copy to the Court, so that your testimony may be followed.

A. (Continuing.) It had a maximum amplitude of about .7 of a foot.

Q. Does that chart, Government's Exhibit 229, show any secondary oscillations?

A. Yes, sir, there is a secondary oscillation at the upper end of Marmet pool, in the latter part of the morning, about ten o'clock, showing a——

Q. (Interrupting.) What date was it?

A. (Continuing.) showing a surge resulting in a vertical line on top of the main wave.

Q. When was that?

A. June 16th.

Q. You refer to a perpendicular line at the top with this notation "591.0," 11,000 C. F. S."

A. Yes, sir.

Q. Have you any opinion as to the cause of that?

A. My opinion is that it was caused by the operation of the lock. That oscillation is exactly of the character and amplitude of the other oscillations that were observed from lockages.

Q. Did you examine the lock records?

A. I examined the lock records and there was a record of lockage at London at that time.

Q. Referring to the notation "591.0" and 11,000 second feet, state whether or not in your opinion the discharge at that time actually was 11,000 second feet? 2388

A. No, sir; I think it is very improbable that it was 11,000 second feet.

Q. And going back to the line you said you thought was caused by lockage, is that what you call a seiche or not—that short vertical line?

A. It is the beginning of a seiche. It runs into or is obscured by the main wave and is not evident on this chart.

Q. Does this phenomenon indicated by the legend 591.0—11,000 second feet, represent a seiche or not?

A. I should say there was a seiche in the pool at that time and, therefore, the ordinary relation between a stage of water and discharge in second feet does not hold at all. The ordinary relation would not hold. At the bottom of the seiche is marked zero cubic feet a second, but the flow was not zero cubic feet a second. Both power plants were in operation at the time, so these figures of 11,000 second feet and zero feet have no meaning. They were clearly not the true discharges at that time.

Q. Are you familiar with what has been referred to in this case as the 1930 wave tests?

A. Yes, sir.

Q. Will you state to what extent, if at all, you have taken this tests into consideration in your study?

A. I have studied these tests very carefully, making a close study of the decrease in amplitude of the various waves as they travelled down the river, passing various gaging stations.

Q. I show you a chart marked Government's Exhibit 227, and ask you whether or not you examined that chart in connection with your studies?

A. Yes, sir; I examined that chart.

2389 Q. What importance, if any, did this power wave test of 1930 have on your studies of the possible effect of the Radford power station.

A. These waves are of great importance in such a study, because they make it possible for one to check his results with his computations or decisions and determine the action of possible waves from future construction on the river. This series shows waves of different amplitude and different volumes, and waves occurring at different stages of the river, and the whole series is just a gold mine of information on the behavior of waves on this river.

Q. What, if any, conclusions did you draw from the wave tests of 1930?

A. One can draw the general conclusion that, as waves travelled down the river, they decreased in volume and amplitude.

Q. Substantially or otherwise?

A. Substantially.

Q. Do they in any instance disclose an increase at a particular point as they travel downstream?

A. In rare instances there is a slight increase in amplitude, occurring about where a wave of approximately rectangular form is changing from that form to triangle form; just after it is introduced in the channel, it may show an increase in amplitude or is likely to show it.

Q. What, if any, significance does that phenomenon have in the consideration of the effect of any such waves in the Kanawha River?

A. Little or no significance in that connection.

Q. Is there such a thing as the characteristic shape of a wave on New River?

A. I should say there is a characteristic shape of waves on all steep rivers, and these waves on New River have that characteristic shape.

2390 Q. How would you describe that shape?

A. The shape of the wave is plotted on the hydrograph and it is triangular with the downstream slope somewhat steeper than the upstream slope, the crest slightly rounded.

Q. Well, now, you say that the front of the wave is steeper than the back. Can you give some indication of the order of that slope in front of the wave?

A. Yes, sir; I could take, for example: No. 2 at Kanawha Falls which has an amplitude of stage in the neighborhood of six or seven inches, as near as I can read on the chart, say seven inches. For its total length we have a wave of twenty-four hours duration and moving three miles an hour, which would be seventy-two miles long. According to the chart, the period of rise is about, as near as I can read the scale, is four or five hours, say about four hours, and at three miles per hour, that would be twelve miles long for the wave front and a height of about seven inches.

By Mr. THOMPSON:

Q. That is No. 2.

A. Yes, sir.

By Mr. JACKSON:

Q. A slope of how much?

A. Seven inches in 12 miles, approximately. I am reading just without scaling it precisely. The rear of the wave would have a fall of about 7 inches in 20 hours and three times twenty would be 60 miles, giving a slope of seven inches in 60 miles, for the rear or descending part of the wave or tide.

Q. State whether or not it is the characteristic of the power tides on New River that they retain their amplitude and volume in passing down the river?

A. No; the characteristic is just the opposite. They lose their amplitude and volume in passing down.

Q. What is the relation between succeeding waves—do they tend to catch up with one another as they go down stream?

2391 A. The front of each wave tends to overlap the tail of the preceding wave. The individual wave being sent down the river would develop a tail in a duration of more than one day—perhaps two or three days—and each subsequent wave arrives on the tail of the preceding wave, so that the amplitude of the crest is not the same as the amplitude of the original wave—it is much less.

Q. Does that mean that the decrease is greater with a periodic power tide of twenty-four hours duration or not?

A. Periodic waves would have much less amplitude as they reached the Kanawha River than an individual wave would have.

Q. What do these 1930 power tests show with reference to the decrease or persistence of power tides in amplitude and volume?

A. They show in general that the tides decrease in both amplitude and volume as they travel down the river, with one minor exception that I mentioned.

Q. Have you made any study of the form or forms of power tides which might be released from the Radford power station?

A. Yes, sir, I made studies of such tides.

Q. What were the forms of those tides?

A. One tide I studied had a rectangular hydrograph having an amplitude of 9,000 second feet and a duration of eight hours.

Q. What does that mean with reference to the initiation of the flow and the cessations of the flow?

A. It assumes the flow to start instantly and continue eight hours for 9,000 feet a second and a cessation instantly.

Q. I show you Government exhibit No. 132, and direct your attention to the green square in the lower figures on the chart, and ask you whether or not, as to shape, that is the kind of wave about which you have just been testifying?

A. Yes, sir; that is the shape.

2392 Q. And this was peaking how many second feet.

A. Nine thousand for 8 hours. This [indicating Pl. Exhibit No. 132] is nine for 6⅓ hours. 2,000 second feet was an error; because that was not enough water to peak 6⅓ hours but only 5⅓ hours.

Q. Professor Thomas, in the light of your experience and knowledge of water power engineering, is it reasonably conceivable that waves—that a wave of that rectangular form, would ever be emitted from the Radford hydro station?

A. No, sir; I think it is highly improbable that a wave of that form would be emitted from the Radford station.

Q. What is the significance of the consideration of a wave of that form. Is it practical or theoretical?

A. It seems to me theoretical.

Q. I now produce a chart bearing the label Appalachian Electric Power Company—Estimated Discharge from Radford power station, and ask that it be marked Defendant's Exhibit No. 594 for Identification.

(Said paper was so marked as indicated.)

Q. I show you, Professor Thomas, Defendant's Exhibit marked for Identification No. 594, and ask you to examine it and state what it is?

A. This is a hydrograph given me by the Appalachian Electric Power Company, as representing a possible hydrograph of operation from the plant during rather severe peaking operation. It shows the discharge from the plant in cubic feet per second at various hours of the day.

Q. In your opinion, is the form of weekday operation shown on Exhibit 594, for identification a reasonable form of peak weekday operation for the Radford plant?

By Mr. Thompson. We object to that. It is not in evidence yet.

By the Court. Read the question. [The question is read.]

By Mr. Thompson. The document is not in evidence yet. It has simply been marked for identification.

By Mr. Jackson. I asked if it was a reasonable form before I offered it.

By the Court. He wants the witness to say whether it is a reasonable form, before putting it in evidence.

By Mr. Jackson. We are dealing with a plant not yet in existence, and I want the witness to consider certain hydraulic effects of certain operations, and I am asking him whether or not this possible method of operation would be a reasonable one.

By Mr. Thompson. Mr. Jackson consistently objected over and over again to any testimony going in with reference to our exhibits which were being offered in evidence, until they were offered in evidence. Here is a question being put to the witness as to whether or not this program is reasonable.

By the Court. He is familiar with the plans of the plant, I suppose, its capacity, etc.

By Mr. Thompson. I don't know whether he is or not. He has not testified to that.

By the Court. He may answer it.

The complainant excepts to the ruling of the Court, for reason stated.

By Mr. Jackson. Read the question. [The question is read.]

By Mr. THOMPSON. He has not qualified him on that subject. His qualifications have gone, as far as I can observe from the rapid fire of questions, to the fact that he advised the City of Pittsburgh, and other cities, in respect to walls they would build along the river banks to protect them from floods.

By the COURT. I think he is qualified. If for no other reason than that he was employed by the Government in consultation as to hydroelectric matters at Bluestone dam; that indicates that he is qualified.

By Mr. THOMPSON. No foundation has been laid for his knowledge of the Radford project or how they will operate it or anything of that sort.

By Mr. JACKSON. They can only assume the methods of operation. It is not in operation and not built.

By Mr. THOMPSON. Further, this Radford project is part of the system of the Appalachian Electric Power Company.

2393 By the COURT:

Q. Mr. Thomas, do you know, generally or specifically the plans for this Radford project?

A. Yes, sir.

Q. The height of the dam?

A. Yes, sir; generally.

Q. What is to be installed as to the hydro-electric capacity?

A. Yes, sir.

By Mr. JACKSON:

Q. In your opinion, is the form of weekday operation shown on Exhibit 594, for identification, a reasonable form of peak weekday operation for the Radford plant?

A. Yes, sir, in my opinion this is a reasonable form of operation for that plant.

Q. In your opinion, what other forms or methods of operation—or rather would other forms or methods of operation for that plant be reasonably possible?

A. Yes, sir.

(Exhibit 594 offered in evidence.)

By Mr. JACKSON:

Q. Professor Thomas, how many years have you taught water power engineering?

A. Since about 1912.

Q. And you have taught at the Rose Polytechnic Institute and the Carnegie Institute of Technology since that time?

A. Yes.

Q. And have you seen the system load curve of the Appalachian Electric Power Company, introduced by the Government as "Government Exhibit 142," to which I direct your attention?

A. Yes.

Q. Have you examined other load curves of the Appalachian Electric Power Company?

A. Yes.

2394 Q. In your opinion, would the operation of the Radford plant, in accordance with the method shown on defendant's Exhibit No. 594, be a reasonable or an unreasonable method of operation?

A. I consider it to be a reasonable method of operation.

The COURT. Let me get something straight: What is meant by the 3000 second foot days?

By Mr. JACKSON:

I will ask the witness to explain that.

A. It would be 3,000 cubic feet times 86,400 seconds in a day. 3000 second feet would be flowing for one day—that volume of water. It represents the total volume of water of the wave or tide, so to speak, measured in second foot days instead of in cubic feet. You will obtain the cubic feet by multiplying the number of second-feet-days by the number of seconds in a day.

By the COURT. Q. Does that mean, for example, that this wave represents the release of the same amount of water, although it is distributed, as would be released at a constant flow of 3000 feet a day?

Mr. JACKSON. It means a peaking of that draft of 3000 second feet a day, resulting in these various flows at various times.

By Mr. JACKSON:

Q. You stated that you had studied two forms of discharge of the Radford power station; am I right in understanding that the first one is a rectangular wave, such as is shown at the bottom of Government Exhibit No. 132, with an amplitude of 9000 second-feet in a duration of eight hours?

A. Yes, sir.

Q. The other wave is one with the characteristics shown on Exhibit 594?

A. Yes.

Q. And do those waves each deal with the same volume of water daily, or not?

A. Yes, for the same amount—3000 second-feet days.

2395 Q. Is the Ivanhoe Gaging Station near the Radford dam site?

A. Not very near.

Q. Is it above or below?

A. Above it.

Q. What were the volumes of the larger power tides of the 1930 series of wave tides in the form in which they pass the Ivanhoe Gaging Station?

A. The first is about 2,700 second-feet days and they vary from that down to 2,000.

Q. Those waves represent the peaking in the particular form of either 2,000 second-feet days or 2,700 second-feet days?

2396 A. Yes.

Q. Coming back to these two hypothetical waves which you have studied, the one the rectangular form and the other the form shown in Exhibit 594, did you reach any conclusion as to the amplitude of these hypothetical power tides if released from the proposed Radford power station, upon their reaching the Kanawha River?

A. Yes.

Q. Upon what do you base your judgment in that respect?

A. My judgment is based on studies of the 1930 series of power tides in the river, taking into consideration the rates of reduction of the amplitudes, and it is also based on the result of experiments I made on an integrating model, showing that portion of the New and Kanawha Rivers.

Q. Did you give any consideration to the mathematical relationship involved?

A. I made certain computations along those lines, although not a complete mathematical analysis of the progress of the wave.

Q. Have you stated the basis on which you reached your conclusion?

A. Yes.

By Mr. Thompson:

Q. Will you state it again?

A. Integrating model tests and a study of the 1930 series, and also certain computations.

By Mr. Jackson:

Q. Professor Thomas, in your opinion, what would be the amplitude of a power tide emitted from the Radford station in the form and volume shown on Exhibit 594, when it reached Kanawha Falls?

A. In my opinion, the amplitude of such a tide would be approximately 3,500 second-feet.

Q. And that would be a reduction from the maximum of what at the point of discharge?

2397 A. 9,000 second feet.

Q. And, in you ropinion, what would be the amplitude of the rectangular wave with 9,000 second feet amplitude in eight hours, as emitted from the Radford Station, when it reached Kanawha Falls?

A. About 4,000 second feet.

Q. And that would be a reduction from what maximum amplitude in second feet at the Radford station?

A. From 9,000.

Q. What would be the maximum of the amplitude of those two waves—the theoretical 9,000 second feet rectangular wave and the one corresponding to Exhibit 594, expressed in terms of variation upwards and downwards, from the equivalent natural flow at Kanawha Falls?

A. This variation would be approximately half the amplitude I gave before. In other words, approximately 1,750 cubic feet per second for the wave shown on this exhibit, and approximately 2,000 above and below the mean in the case of the rectangular wave.

Q. Is it my understanding that that means, in the case of the wave represented by Exhibit 594, there would be at Kanawha Falls a maximum variation of 1,750 second feet below what would otherwise be the natural flow?

A. Yes.

Q. And the same amount above?

A. Yes, sir.

Q. And the situation would be the same for the rectangular wave except the variation would be 2,000 second feet?

A. Yes.

Q. Are these results which you have just given applicable to isolated power tides, or to periodic power tides?

A. They are applicable to periodic power tides occurring for a succession of days.

2398 Q. How long would these figures apply if you had a power tide of the same kind you have described following each day?

A. They would be indefinite, each following the other as long as the series lasted.

Q. Assuming that the power stations were entirely out of operation on a Sunday, would the results be true of power tides at Kanawha Falls caused by power station discharges of the two given forms on the succeeding Monday?

A. Yes, the amplitude would be about the same on Monday as on other days.

Q. And assuming that the power station had been shut down for a period of a day and a half at the week end, would the figures that you have given be applicable to the emission of power waves at the two times you have described on the following Monday?

A. Yes, those figures would apply to them.

Q. Assume that the power plant were to be shut down for a period of two days, would the conclusions that you have stated be applicable to waves of the form and amplitude that you have described, if they were emitted from the plant on the following Monday?

A. Yes.

Q. Have you any opinion as to what would be the maximum rate of increase in flow of these two forms of power tide, the rectangular tide and the one corresponding to exhibit 594, at the time they were passing Kanawha Falls—the rate of increase in flow? I want to know what would be the maximum rate of increase in flow when power tides of the two kinds you have described having been emitted at the Radford dam site came down the stream and were passing the Kanawha Falls?

A. For the rectangular tide, the maximum rate of increase at Kanawha Falls would be about 1,200 second feet per hour, 2399 while for the tide corresponding to the exhibit 594, the maximum rate of increase at Kanawha Falls would be about 800 second feet per hour.

By the COURT. Q. What is the difference between this question and the answer and the question you asked a minute ago, where you said the answer would be the wave would increase 4000 feet?

Mr. JACKSON. 3500. The difference is this: The answer to the succeeding question shows a wave that had an amplitude at the time of discharge in the rectangular form of 9,000 would have decreased to 4,000 when it got to Kanawha Falls, and if it were in the form of 594, it would have decreased to 3,500. I am seeking to draw from the witness the question of rate of increase in flow. That is, if one of these waves comes down, it increases the flow, and I am now seeking to draw from the witness the rate in which that increase takes place. For instance, if it was a wall of water, it would have an instantaneous increase of, say 4,000 second feet, and, on the other hand, if it was a gradual flow, the increase would be only so much. In other words, it would be a gradual rise at Kanawha Falls.

The COURT. The crest of that wave would be—do I understand the crest of the wave would be carrying an increase at the rate of 4,000 feet?

Mr. JACKSON. Eventually a point would be reached on that wave, if it was a rectangular wave, when there would be an increase at Kanawha Falls of 4,000 second feet, but that point would not be something which happened as an immediate change. It would be a gradual change in condition, and the point of this question is to bring out from the witness how gradual it would be. That is, if it was a wall of water, it would have one effect, and if it was a gradual increase it would have no effect. I might ask the witness to illustrate it, as I should have done before, as he could do it much better.

By Mr. **Jackson**:

Q. Can you illustrate that a little more clearly than I can explain it to the Judge?

A. Yes. (Witness makes diagram.) If this diagram would represent the hydrograph of one of these waves at Kanawha Falls, say the wave caused by a wave at Radford similar to Exhibit 594, the figure of 3500 second feet which I gave as the maximum amplitude of that wave at Kanawha Falls, would be the height of the wave, and the figure which I gave for the rate of rise would be the increase of rise in one hour. If a vertical line is drawn from the curve intercepting a
2400 horizontal distance of one hour, the rate of rise per hour which I gave as 800 second feet would be represented by this line. One is the total amplitude of the wave, and the other the steepness of its front, as measured by the rate of rise per hour.

By Mr. **Thompson**:

Q. What is the distance across there?

A. 24 hours.

By Mr. **Jackson**:

Q. Will you mark that for the two figures?

A. Yes. (Witness marks on plat.)

By the **Court**:

Q. That is 800 feet?

A. That is the rise of one hour.

Q. Then it would be some time in the progress of that wave before the rate of flow would have been increased by as much as 3500 feet over what it was before the wave reached there?

A. Yes.

By Mr. **Jackson**:

Q. And would the rate of that increase depend upon the slope of the front of the wave and the rate of travel?

A. Yes, it would depend on those two things.

Q. And this kind of wave, roughly, what would be the length of the slope in the front of the wave.

A. Assuming that the velocity of travel of the wave is three miles an hour, and the duration of the rise from here to here [indicating] is about four hours, the length of the front of the wave would be three times four, or twelve miles.

Q. It would be about twelve miles?

A. Yes.

By Mr. THOMPSON:

Q. That is the crest of the wave?

A. The length of the front of the wave.

By Mr. JACKSON:

Q. That wave, if it is 3,500, it would be a little more than four hours?

2401 A. Yes. I used as an illustration four hours. The actual rise is more than four hours.

Q. You said the base of the front of the wave would be around twelve miles or better in length?

A. Yes.

Q. Do you know what is the vertical height of that front of the wave?

A. I do not have that figure exactly in my mind, but it is in the way of seven or eight inches at Kanawha Falls. That is just approximately.

Q. So the slope of the front of the wave, as it moved down the stream at Kanawha Falls, would be in the way of base of twelve miles and a vertical height of seven or eight inches?

A. Yes.

By the COURT:

Q. Do your figures and statements there—could they in any way be modified by the stage of the water in the stream below the point of release?

A. No, the waves seem to have about the same amplitude at different stages. There is not much variation in the amplitude with the stage.

By Mr. JACKSON:

Q. Mr. Thomas, will you mark on your diagram there, so as to indicate the length of that wave in miles, on an average, and in hours at the bottom of the wave?

A. (Witness marks on chart.) I might say I used the figure three miles an hour velocity as a representative figure. I did not happen to have the exact figure at this time, but it is between three and four.

Q. It would be somewhere around 72 miles or better?

2402 A. Yes. I do not like to mark this on this diagram, as this is a diagram of time. If I mark miles on it, it would not be correct. I can say corresponding to 72 miles on the profile. The correct time on the other would be comparative.

Mr. JACKSON. Mr. Reporter, will you mark the chart on which Mr. Thomas has drawn as "Defendant's Exhibit No. 595."

NOTE.—The chart is marked accordingly.

Q. Now, Professor Thomas, assuming a discharge at Radford of waves of the forms you have considered, that is the rectangular wave of 9,000 second feet amplitude, and eight hours duration, and the wave corresponding to Exhibit #594, please state what would be the maximum rate of decrease in the discharge or flow as these two power waves or tides, respectively, passed Kanawha Falls?

A. For a wave corresponding to Exhibit #594, the maximum rate of decrease would be about 250 second feet per hour. The figure here is not to scale [referring to drawing] and on this sketch this is not short enough compared to the 800 but the maximum rate of decrease would be 250 second feet per hour.

Q. What would be the maximum rate of decrease per hour at Kanawha Falls in the case of a rectangular wave of 9,000 second feet amplitude of eight hours duration, at the Radford dam site?

A. About 300 second feet per hour.

Q. Why does the rate of decrease per hour in the case of each of these two waves on passing Kanawha Falls differ from the rate of increase per hour at the same point for the same waves as they approach and pass Kanawha Falls?

A. Because the front or downstream face of the wave is steeper than the tail or up-stream face of the wave.

Q. Do you know how those rates of increase and decrease in flow at Kanawha Falls, resulting from the passage of the two forms of power waves from Radford which you have just described, compare with the actual rates of increase and decrease in flow out of the London and Marmet power stations?

A. These rates are very much smaller than the present
2403 rates of increase and decrease out of the London and Marmet
stations. At those stations the maximum rates which are ordinarily used are in the neighborhood of 3,000 second feet per hour, and several times greater than the rates I have mentioned.

Q. That is the rates in increase and decrease in flow at those points?

A. Yes, sir.

Q. From the standpoint of the possibility of producing seiches and oscillations in the pools, what is the more important, increase or decrease in flow?

A. Decrease. These seiches are ordinarily caused by decrease. In my test I made on that matter of decrease the decrease of 3,200 second-feet per hour produced a seiche of 3/10 of a foot. That was at London. The height of the seiche was 3/10 of a foot. The decrease which produced that seiche was more than twelve times this rate of decrease of 250 second-feet per hour.

By Mr. THOMPSON:

Was that the upper or lower London——

By the WITNESS:

Lower.

Q. Did you state the ratio between the rate of decrease of this experiment at London and the rate of decrease for your wave?

A. Yes; I stated that.

Q. That applied to Exhibit #594?

A. Yes, sir.

Q. Can you tell me what was the ratio between the rate of decrease in this test at the London dam and the rate of decrease which you found for a rectangular wave discharged at Radford by the time it had reached Kanawha Falls?

A. The rate of decrease for the rectangular wave by the time it had reached Kanawha Falls was 300, which was less than 1/10 of that observed during the test at London.

Q. In your opinion would it be possible for power tides from the Radford power station of the two forms and sizes which you have described to cause seiches or oscillations in the Kanawha navigation dam pools?

2404 A. No. In my opinion it would be impossible for waves released from a point as far upstream as Radford to cause any perceptible seiche in those navigation pools.

Q. Could the instantaneous shutting off of the flow of 9,000 second feet out of the Radford power station cause any seiche or oscillation of the London or other Kanawha River navigation pools, sufficient to cause any perceptible drop below the normal pool level?

A. No, it could not. Although the wave might be shut off instantly at Radford, this is, the tail of the wave would be vertical at Radford, by the time it had traveled downstream its tail would have flattened out, so the decrease would take many hours; therefore, the instantaneous shutting off at Radford would have no effect at all in producing a seiche.

Q. What is the period, natural period, of oscillation of the London pool at elevation 614 or 611?

A. It is approximately 1.2 hours.

Q. And what is the natural period of oscillation of the Marmet pool?

A. Approximately 1.8 hours.

Q. Will you explain what is meant by that?

A. If one of these seiches occurs which has been likened to the tilting of liquid in a plate of soup, the period of oscillation is the time from the rise at any one time to the subsequent rise at that same point. If a seiche occurs in the Marmet pool, the water at one end of the pool will gradually rise and fall, that is, from the high point and low point back again is the period of oscillation.

Q. If a seiche occurred at the upper end of the Marmet pool would the period of oscillation have any relation to the time it would take for that seiche to travel down to the dam and back to the upper end of the pool again?

A. Yes. The period of oscillation is equal to the time it would take a wave to travel the length of the normal pool and back.

Q. What, if any, relationship is there between the natural periods of oscillation on the London and Marmet pools, and the
possibility of a possible power wave, such as you have de-
2405 scribed, the two kinds you have been considering, being dis-
charged at Radford causing any oscillation in the London
or Marmet pools?

A. In order to cause oscillation in a body of liquid, you have to have an impulse of shorter duration than the period of oscillation. In tilting a plate of soup, to start this oscillation, you have to tilt it quickly. If slowly, you cause no oscillation in the surface. These tides from Radford will occupy several hours to rise and fall, those periods being much longer than the oscillation at those pools; therefore, they would cause no seiches in those navigation pools.

Q. Can you state what would be the period of time required for one of those Radford power tides to rise at the London and Marmet pools, and the period of time required for the fall of those waves at the London and Marmet pools?

A. The time of rise is approximately five hours, four and a half to five hours; and the time of fall is the difference between that and twenty-four, or in the neighborhood of nineteen hours.

Q. In your opinion, is there any possibility that power tides from the Radford station could cause the London pool or any other Kanawha navigation pool to have its water surface tilted in such way as to cause the upstream end to be lower in elevation than the downstream end?

A. No. In my opinion it would be impossible to tilt the water in those pools that way.

Q. Professor Thomas, assuming the discharge of a wave at the Radford power station with the same form as that shown on Exhibit #594, but with a smaller maximum amplitude, would the effects produced by the resulting power tides at Kanawha Falls be greater or less than those you have described in connection with the wave corresponding to Exhibit #594?

A. They would be no greater, and probably less.

Q. Professor Thomas, assuming a wave of the same form as that shown upon Exhibit #594, and particularly the same duration, but with a lesser maximum amplitude, and using a lesser total volume of water, would that wave, in your opinion cause seiches or oscillations in the navigation pools on the Kanawha?

A. No.

2406 Q. Now, Professor Thomas, assuming a form of operation which would result in a peak load output of 3,000 second foot days, or in other words, using 3,000 second feet days for peaking purposes, but with a greater duration of peak load than shown on Exhibit #594, what would be the effect of the resulting power tide having been emitted at Radford when it reached Kanawha Falls, as compared with the effects of the tides from the two forms of waves you have already testified about in detail?

A. Under conditions as set out in your question, the amplitude of a wave at Kanawha Falls would not be greater and would probably be less than of that which I previously described.

Q. And what would be the situation as to the possibility of seiche or oscillation in the navigation polls?

A. Such waves could cause absolutely no seiche or oscillation in the navigation pools.

Q. I want to invite your attention again a moment to a hypothetical rectangular form of wave which you considered, that is, the hypothesis of the discharge of a perfectly rectangular wave at Radford, with an amplitude of 9000 second feet, and a duration of eight hours, what is your opinion as to whether any conceivable operation of the Radford station could at Kanawha Falls produce tides with amplitudes greater than would be produced by a discharge from the Radford station in this particular rectangular or block form about which you have testified?

A. No conceivable method of operation could produce, with that same volume of water, a greater tide at Kanawha Falls.

Q. Would that be true of any other volume of water, assuming the same height?

A. The maximum amplitude is 9,000 second feet.

Q. What I wanted to find out is, a maximum amplitude of 9,000 second feet, and a perfectly rectangular form of wave, would the extension of the duration of the wave to more than eight hours, change the effect down at Kanawha Falls?

A. No, it would not make the amplitude of the wave at Kanawha Falls any greater.

2407 Q. And suppose you went far enough and kept extending the duration of that rectangular wave with an amplitude of 9000 second feet, what would happen?

A. If you extended it the full twenty-four hours it would be a uniform flow and no waves would occur at Kanawha Falls.

Q. Would the result of that be that the amplitude of fluctuations at Kanawha Falls would grow less from some point of duration, around eight hours—between that and twenty-four?

A. Yes, sir.

Q. You have testified you are consulting engineer on hydraulic design at the Bluestone Reservoir, I believe?

A. Yes, sir.

Q. Have you studied the effect of power tides from the Radford station upon the pool of the Bluestone reservoir project as it is described in Government Exhibit #145, the 308 report on the Bluestone?

A. Yes, I have made a study in connection with this case, and not in connection with my work on the Bluestone dam.

Q. Have you considered in particular the effect of power tides of the form and character about which you have been testifying this afternoon in that connection?

A. Yes, sir.

Q. Where is the head of the proposed power pool for the Bluestone project?

A. In the vicinity of Glen Lyn.

Q. In your opinion, would the Radford power tides of the two forms about which you have been testifying this afternoon be capable of causing seiches or oscillations with amplitudes of five feet upward and downward in the Bluestone reservoir at and downstream from Glen Lyn?

A. No. In my opinion neither of these waves which I studied would produce any perceptible oscillation at all in the surface of the Bluestone reservoir, not as much as one-half inch or one inch.

2408 Q. Will you state somewhat more fully the reason for your opinion in this respect?

A. I have studied that by analytical methods and also by constructing what I call an integrating model of the Bluestone reservoir, with different vertical and longitudinal scales, and it was sensitive enough to detect seiches of above five one hundredths of a foot, or ⅝ of an inch.

(A. (Continuing.) I could not detect any perceptible seiche in the reservoir on this model, which checked my computation, which showed the height of seiche in the Bluestone reservoir would be less than five one hundredths of a foot.

Q. You say ⅝ of an inch. Do you refer to the model or reservoir?

A. In the actual reservoir.

By the COURT:

Q. What pool elevation did you have in mind when you answered a question a little while ago, at the Bluestone?

A. That was spillway elevation, 1490.

2409 By Mr. JACKSON:

Q. What is the natural period of oscillation of the Bluestone reservoir when it as at pool elevation, 1,490?

A. It is about two hours.

Q. Now does that effect have anything to do with the possibility of the production of a seiche from the inflow of a power tide admitted at Radford?

A. Yes, sir.

Q. What has it go to do with it?

A. The period of rise of a power tide would have to be less than that if it produced a seiche.

Q. Would it be?

A. No; it would not be.

Q. Roughly, what would it be?

A. I would have to look up my notes to answer that question. (Witness does so.) About four hours.

Q. Prof. Thomas, assuming the Bluestone reservoir was in existence, what, if any, effect would the Bluestone reservoir have upon dampening out the Radford Power Tide?

A. If the Bluestone reservoir were in existence, I presume there would be a power station there and there would be an operator there and he would also operate the gates on the Bluestone dam. Under those conditions it would be absolutely in the power of the operator to control the Radford tide in any way desired. He could store up those tides and release them in whatever manner best suited to the generation of power at Bluestone. Of course, it would ordinarily be worth while to do that, and not let any of the Radford tide spill over the spillway, and to utilize every bit of power for power generation at Bluestone and under that condition the tide could not pass through the Bluestone reservoir at all. On very rare occasions it might be possible for the flow of the river to be slightly in excess of the capacity of the Bluestone Power plant, so that the water would be spilling over the spillway of the Bluestone reservoir, and at the same time there would be a remote possibility that the Radford station might be operating on peak load. It would be unlikely with so much water in the river as that, but it would be a possibility. Under those 2410 conditions it is conceivable that the Radford tide could pass the Bluestone Reservoir but in enormously dampened out form.

Q. In your opinion would it be probable there would be peaking at Radford when there was a flow over the spillway at the Bluestone Reservoir?

A. In my opinion there is a very improbable combination.

Q. Is there any other combination that you know of under which, with the Bluestone Reservoir in existence and in operation that the Radford power tide could pass the Bluestone Reservoir?

A. No; I cannot think of any other possible condition.

Q. Under the condition you have assumed, with a pool level at elevation 1,490 feet, and water spilling over the spillway, how large would the flow have to be at a minimum, that is, what is the hydraulic capacity of the Bluestone Power station?

A. I don't have that in mind now but I think it is 11,000 second-feet. I am not positive about that figure.

Q. Assuming the hydraulic capacity of the Bluestone to be 11,000 second-feet, would the flow have to be in excess of that to result in this coincidence you have described?

A. Yes; it would have to be in excess of that.

Q. By the COURT. I want to know why it would be improbable that the Radford dam would be peaking when the river was full?

By Mr. JACKSON:

Will you answer the Court's question. State why you deem it improbable that the Radford plant would be peaking when the flow at Bluestone would be 11,000 second-feet?

A. With so much water running, they could run the Radford plant day and night for the purpose of saving coal in their system, it would not be necessary to run it at peak, but under those circumstances they could run it continuously.

Q. Do you mean there would be enough water available to run that Radford plant at its maximum for 24 hours?

A. At a uniform high rate for 24 hours, and they need not attempt to save it up at night and release it during the day
2411 but they could just run it continuously so as to save coal on the whole system.

By the COURT:

Q. At what hydraulic capacity would they be running at Radford?

A. They could run their full capacity, 9,000 second-feet, day and night.

Q. That is the capacity they have been speaking here as being the peak?

A. There would be enough water so that they could keep on going day and night and they wouldn't have to shut down, they could simply run continuously. The purpose of peaking when there is not much water running in the river, is to save it up at night and utilize it in the daytime, but when there is plenty of water in the river they don't have to do that, they just run continuously, generating as much power as they want to, and shut down their steam plant.

Q. If, when the flow into the Bluestone reservoir exceeded 11,000 second-feet, the Radford reservoir was partly empty, would the Radford operation necessarily be uniform?

A. My opinion is that under those conditions with the reservoir partly empty there will be no peaking and the flow will be uniform.

Q. I meant to assume in that question that the Bluestone reservoir was full?

A. Yes.

Q. In your opinion what would be the likelihood of the Radford reservoir being partly empty when the Bluestone reservoir was full and the flow was in excess of 11,000 second-feet at Bluestone?

A. I think it would be improbable that the Radford reservoir would be partly empty under those conditions.

Q. Assuming these coincidences where you say it might be possible for Radford power tide to spill over the Bluestone spillway, what would be the effect by way of dampening out upon those Radford power tides in passing through the Bluestone reservoir?

2412 A. That would be enormously dampened out by the great surface area of the Bluestone reservoir.

Q. Please explain that.

A. The period of tide would necessarily be increased for 24 hours.

By Mr. **Thompson**:

Q. What is the area surface of the Bluestone reservoir?

A. Approximately 6,000 acres.

By Mr. **Jackson**:

Q. Will you please proceed with your explanation?

A. The surface of that reservoir would act somewhat as a flood retarding reservoir in dampening out those tides, and greatly increase the duration of them, and lower the crest of them.

Q. What is the storage capacity for an inch of depth in the Bluestone reservoir at that elevation, 1,490?

A. About 500 acre-feet per inch of height, and that would make 6,000 acre-feet per foot of height.

Q. How would the degree of dampening in the Bluestone reservoir of the Radford Power wave compare with the dampening which would occur to those same Radford power tides as they passed through the open river channel at the site of the Bluestone reservoir?

A. The dampening would be enormously greater with the Bluestone reservoir in place, than would have been the case in the original river channel.

Q. How does the power tide or wave depart from the equivalent natural flow?

A. I assume by that question you mean, how much does it vary above and below the natural flow?

Q. Yes.

A. By approximately half of its amplitude.

Q. How does that phenomenon affect the problem of reregulation of such waves?

2413 A. You mean reregulation by a reservoir?

Q. Yes. I think you had better explain what reregulation is first.

A. You speak of reregulation in the wave occurring when such wave enters the reservoir and it is dampened out by the reservoir so as to vanish altogether, so that the flow below the reservoir would be entirely uniform. I think I can explain that best by making a diagram.

(Court takes a recess.)

By Mr. Jackson:

Q. Please proceed to make your diagram.

A. I think I can explain the principle of reregulation most clearly by an hypothetical triangular wave. On this triangular wave I will draw in the mean flow line marking it M-M, and will cross hatch the volume of crest wave above the mean flow line. In order to reregulate that wave in a reservoir, it would be necessary to have a reservoir whose volume is equal to the volume of the trough wave. I will crosshatch this trough, marking the crest of the wave C, the required volume of reservoir R—. The crest of the wave must exactly fill the reservoir if the reservoir is of the correct size to completely regulate the wave. On this triangular diagram, I will draw the base flow line and call attention to the fact that the volume of crest of the wave is just one-fourth of the volume of wave, because we can split that portion of wave below the mean flow line into three triangles, whose volume is each equal to the volume of the crest. Therefore, in this hypothetical wave of triangular shaped size the reservoir required to regulate the wave would have a volume equal to one-fourth the volume of wave.

In actual reservoirs or actual waves where the crests are somewhat rounded it would require a volume slightly larger than one-fourth the wave volume to regulate waves so as to produce a uniform flow in the stream.

Q. Please state within what limits would that slightly increased volume be that would be required for reregulation of a wave with a somewhat rounded crest from the triangular wave you have used on your chart?

A. I made a computation for what is called a sine wave
2414 and in that case the volume of the crest is about one-third the volume of the wave. In waves such as we have on New River, the required volume would be between one-third and one-fourth of the wave volume.

Q. Could you draw on the bottom of that chart a series of small waves and draw the median line through them showing how much of the waves have to be taken care of in case of re-regulation, that is like the New River waves possibly that form a series of waves. Could you put it on the bottom of the chart?

A. I will draw the mean flow line on this diagram and the portion of waves that will have to be stored to regulate flow would be the portion above the mean flow line. Those crests above the mean flow line could be eliminated altogether by being stored in a reservoir having this volume.

Q. Now what would be the condition after that has been done, with reference to the flow?

A. The flow would be absolutely uniform, with the depth along the median line.

I will ask the Reporter to mark the chart Defendant's Exhibit 596.

(Said chart is marked Defendant's Exhibit 596.)

Q. Would you mind filling in the remaining valleys in the lower figures so that the chart will be complete?

(Witness does so.)

By Mr. Jackson:

Now I offer in evidence the chart just marked Exhibit 596 and I also want to offer in evidence chart marked Defendant's Exhibit 595, which I believe I had marked but forgot to offer it.

(Said charts are filed, marked Defendant's Exhibits 595 and 596.)

Q. Prof. Thomas, what is the capacity of the London Pool on the Kanawha River, between elevation 614 and 611?

A. It is approximately 2,700 acre-feet.

Q. Will you state whether this 2,700 acre-feet of pondage in the London pool would be sufficient to re-regulate the Radford power tide resulting from the two forms of waves, that is, the rectangular wave with 9,000 second-feet amplitude and 8-hour duration, and the wave corresponding to Exhibit 594, about which you have already testified?

A. In each case the London Pool would have a volume several times greater than that required to regulate the waves from Radford.

By WITNESS:

May I correct my last answer? I said the storage volume would be several times as great. The correct answer is that in case of a wave corresponding to Exhibit 594, the capacity will be two and half times as great as required and in case of rectangular wave it would be twice as great as required.

Q. When you speak of a rectangular wave, you refer to its form at Radford and not at Kanawha Falls?

2415 A. Yes, sir; at Radford.

Q. Now assuming that for some reason the three-foot draw down between elevations 611 and 614 in the case of the London Pondage would not be available for reregulating any Radford Power tides which might pass Kanawha Falls, and that no reregulation of these tides had been accomplished in any pond or reservoir upstream from the head of the London Pool, and assuming the Winfield and Gallipolis dams to have been completed and placed in operation. What, in your opinion, or rather what is your opinion as to whether any Radford power tide passing Kanawha Falls would be transmitted unchanged through the Kanawha navigation pools into the Ohio River, downstream from the Gallipolis dam?

A. I think it is improbable that these waves would be transmitted down those navigtaion dams. The surface area is very large, so large that variation in water level of about two inches in those pools would be sufficient to reregulate the power waves from the Radfort plant.

Q. A variation of water level of two inches in each pool?

A. In the Marmet and Winfield pools but if the Gallipolis pool were included, a variation of about three-fourths inch in water level would be sufficient to regulate the Radford waves, since the ordinary fluctuations in the level of those pools are much greater than two inches and more than three-fourths, I think it improbable that these waves would pass through.

Q. If they came in without reregulation, could these variations you have described, occur?

A. Yes, they would occur in those pools and thereby dampen out the waves o reregulate them.

Q. Could variations of three-quarters to two inches in pools of that character ever occur under other circumstances than the one assumed?

A. Yes, sir, in navigation pools a variation of the level of a few inches are very common, according to the regular course of operation.

Q. Assuming that no reregulation of power waves about which you have testified above the London Dam, would it be possible for any part of those power tides to pass the London Dam?

A. The question should specify whether London is to be used to regulate the waves, or not.

2416 Q. Assuming that London's storage reservoir is not to to used for reregulation at all, and assuming there has been no regulation upstream since the waves left Radford, under those conditions, in your opinion, could any part of these Radford power tides pass the London Dam?

A. Yes, I think if there was no regulation they could pass the London Dam.

Q. What would be the effect in your opinion?

A. If the London dam were not used for regulation, in other words, if its level were held exactly constant, the wave would pass right through the London Dam, or London plant.

Q. Assuming that the passage of these power tides through the London pool, without the use of the London pondage, without reregulation, upstream how would they compare with the fluctuations resulting from the operation of the London power station?

A. I do not follow the question clearly. Under these conditions, the London station would pass the wave through and the fluctuations of the wave would be the same as the fluctuations of the power station.

Q. What would be the relative magnitude of such power tides, if they passed through London pool, in comparison with the magnitude of the fluctuations produced below London dam, by the operations of the London hydro-electric plant?

A. (No answer.)

Q. That is, you said under all these assumptions, you thought some effect of these tides might pass London dam?

A. Yes, sir.

Q. I want to know how these power tides, as they pass London dam, below that dam, would compare with fluctuations produced below the dam by the operation of the London hydro plant?

A. The amplitude of the power tide, based on Exhibit No. 594, as I recall it, was stated by me to be 3,500 second feet. That would be the amplitude of that wave or that tide passing through the London station. At present, the variations of the flow through London are much larger than that—several times larger. I was in the
2417 London station when they were operating at 16,000 KW;
that would be at about 10,000 second feet.

Q. Well, as this power tide, under the assumed conditions, passed London dam and went through Marmet, what would be the effect on it—would it be dissipated in fact, or not?

A. If the Marmet pool were not used or regulated at all, it would not be dissipated in the Marmet pool.

Q. Are you sure 16,000 was there at London or Marmet?

A. I am not sure. I am not certain of that; I had better say approximately that.

By Mr. JACKSON:

Q. Now, Professer Thomas, assuming that these power tides, about which you have testified, from Radford were not subjected to any reregulation, as they came to the London pool, and passed through the London, Marmet, and Winfield power stations, in your opinion, would they be recognizable in the Ohio River down stream from the Gallipolis dam?

A. If the Marmet, London, and Winfield pools were held mathematically at a constant elevation?

Q. No, sir. If the power tide came into the London pool or passed through the hydro-electric plants of these three dams, London, Marmet, and Winfield——

By Mr. JACKSON:

Q. The plants normal in operation?

A. With the pools fluctuating—with small fluctuations in the pools, they would absorb the waves and regulate them so that they would not be perceptible at the Ohio.

Q. Would that be true in merely normal fluctuations in the pools?

A. Yes, sir.

Q. You testified, Professor Thomas, that there would be no effect of these power waves from Radford observable below Gallipolis. By that answer, state whether or not you mean that there would be no effects of any power waves observable below Gallipolis in the Ohio River from anywhere?

A. You mean from other stations farther up the Ohio?

Q. Or anywhere else?

2418 A. I don't know of any stations that would produce any such fluctuations below Gallipolis.

Q. What about Winfield, on the assumption that it were completed?

A. If I may answer the question in a slightly indirect way: Winfield, London and Marmet have power stations. As I say, the waves are entirely obliterated at those stations, unless the operators of these stations, so to speak, try to pass them through by taking unusual precautions.

2419 The pools normally show some storage in the ponds to absorb waves. I should say that it would be improbable that any of these waves would pass through London, Marmet or Winfield dams and appear in the Ohio River.

Q. Is that the same as saying that, if there is any power tide below Gallipolis dam, that they would be there because of the operations of the operator of the Winfield dam?

A. I think that is correct; except that I do not know whether or not there is any other power station anywhere on the watershed within reaching distance of Gallipolis. ~~I think there is not.~~

Q. Assuming there is none, would that be a correct statement?

A. Yes, sir.

Q. Professor Thomas, during periods of low or moderate flow through the Kanawha navigation pools, would physical conditions be such that silt would be deposited?

A. Very little silt would come down the river.

By Mr. Jackson:

Q. Under those conditions, if any silt were deposited, in what parts of the pool would it be deposited?

A. In my opinion, silt would come so finely divided, it would be carried into the deeper parts of the pool.

Q. Is that answer applicable to each of the navigation pools on the Kanawha River?

A. Yes, sir. I should say so.

Q. What, in your opinion, would be the effect of the Radford reservoir upon the matter of silt in the New River?

Q. (Continuing):—and the Kanawha navigation pools?

A. In my opinion, the Radford reservoir would act as a silt catcher, catching practically all silt above that site.

By Mr. Thompson:

I thought you said that it would go into the deeper pools on down the river.

A. Into the deeper parts of these pools.

By Mr. Jackson:

2420 Q. Referring to the Kanawha navigation pools, would the power tides from the Radford plant, or any other conceivable withholding of the flow at Radford dam, increase the amount of dredging needed to maintain the navigable depths at the heads of the Kanawha Navigation pools, when considered over a term of years?

A. No, sir.

Q. Would the amount of silt in the navigation pools be less or more than if the dam was not built?

A. Less.

Q. In the case of the Kanawha navigation pools, what would be the evaporation from the surface of the pools?

A. It would be very small, depending on the area of the pool. It would be small, in comparison with the leakage and lockage.

Q. Can you give an estimate, for instance, of the Winfield pool?

A. I made a computation of the evaporation from the Winfield pool, on the assumption of six inches of evaporation from the surface of that pool, during a very dry month, with no rainfall.

By Mr. **Jackson**:

Q. What was your figure?

A. My figure was about 30 cubic feet per second.

2421 Q. I show you a book, which is marked Defendant's Exhibit No. 544, for identification. Do you know what it is?

A. Yes, sir; it is a report on Power waves of New River and the Kanawha River, prepared in the office of the United States Engineers at Huntington, West Virginia, February 29th, 1932.

By Mr. **Jackson**:

Q. Are you familiar with that document?

A. Yes, sir.

Q. Or copies of it?

A. Yes, sir.

Q. Was one ever transmitted to you?

A. Yes, sir. A copy was sent to my laboratory.

Q. From where?

A. It came from the Secretary of the American Society of Civil Engineers', Special Committee on Hydraulic Research in Portland, Oregon.

By Mr. **Thompson**:

Q. When did it come to you?

By Mr. **Jackson**. Can I finish?

By Mr. **Thompson**. No, sir.

A. Sometime during the spring; I am not certain about the date; my feeling is that it was about the 1st of May.

Q. How did it come to you? Was it sent in the ordinary mail and without solicitation on your part?

A. May I explain about that. I received that report—I am a member of the American Society of Civil Engineers and on a committee on research in regard to the traveling of waves. The Secretary of the Committee got out circular letters and sent them to all Engineers' offices in the United States, where he thought he could get information on traveling waves, and that letter 2422 was received in the Huntington office and this report was mailed from that office to the Secretary of our Committee and the Secretary mailed it to me.

By the **Court**. It is not offered yet?

By Mr. **Jackson**:

No, sir.

Q. Did you later have any communication from the District Engineers' office about it?

A. Yes, sir. They sent me a telegram, asking me to send the report to the Division Engineers' office of the War Department at New York.

Q. Did you see a copy of that report elsewhere?

A. Yes, sir, I saw a copy of that report.

Q. Where?

A. In the office of Colonel F. W. Scheidenhelm in New York City.

Q. Is that a copy?

A. I think this was the same copy [indicating].

Q. Is that Exhibit No. 545, the same as the copy of the report you received and have described?

A. No. 544—it is the same in my opinion; it is essentially the same. I have not checked it page by page.

By Mr. **Jackson**:

Q. Were there any qualifications about this exhibit No. 544, or the copy of it, when it was transmitted to your committee, Professor Thomas?

A. No, sir.

Cross examination by Mr. **Thompson**:

Q. Professor Thomas, I believe you took your C. E. Degree in 1908, did you not?

A. Yes.

Q. Where did you take that degree?

A. At Columbia University.

Q. Then you started to teaching, didn't you, at Columbia?

A. Yes; that summer in the surveying camp.

2423 Q. You taught one summer?

A. Yes.

Q. You did not have anything to do with wave studies or anything while teaching, did you?

A. No.

Q. Then, you did a year and a half at Washington University?

A. Yes.

Q. You did not have anything to do with wave studies there, did you?

A. No.

Q. What did you teach?

A. I taught surveying and drawing.

Q. From 1910 to 1923 you were at the Rose Polytechnic Institute, were you not?

A. Yes, sir.

Q. That is where?

A. At Terre Haute, Indiana.

Q. You did not have any experience there or do any work in hydroelectric matters, did you?

A. I taught a course in water power engineering and had charge of student theses on design of water projects.

Q. That was wholly theoretical and technical, and had nothing to do with any practical work about hydroelectric projects or wave studies?

A. I don't know how you use the work "practical;" it was a student thesis work.

Q. You did not go out and make any studies of waves on the river, did you?

A. During the period at Terre Haute I studied flood waves on the Wabash.

Q. And what did you study on the Wabash River?

A. For the Pennsylvania Railroad.

2424 Q. What was the reason for that?

A. In connection with litigation arising from the 1913 flood.

Q. It had nothing to do with a hydro-electric plant?

A. No; flood waves.

Q. You were there with respect to what kind of walls they would build for the protection of the railroad right-of-way?

A. No; it was not that.

Q. What was it?

A. It was a damage case arising from damage caused by the 1913 flood.

Q. Then in 1923 you went to Carnegie Institute, was it?

A. Yes.

Q. And you taught there, didn't you?

A. Yes.

Q. In fact, most of your life—28 years of your life, at least, have been spent in teaching?

A. Yes, indeed.

Q. You have been in the class room?

A. Yes.

Q. I believe you said you did something on the Miami Conservancy District?

A. Yes.

Q. How long were you there?

A. I was there during the summer of 1918, and then I worked on the technical report in my spare time during the following winter.

Q. Now, isn't it a fact that you wrote a letter asking for a job by which you could make a little money during the summer and so fill out your professor's salary?

A. I do not recall writing a letter in those terms, and I am certain I did not write it in those terms. In fact, I did not write a letter there asking for a job. The request came from them to me, because of the article I wrote in the Engineering News.

2425 Q. Isn't it a fact you got about $200 a month for your work there?

A. No. I don't remember what I got, but it was not $200.

Q. It was $175, wasn't it?

A. I can't remember what it was, but the ordinary assistant's salary.

Q. You were assistant engineer with a great group of other assistant engineers who were there?

A. There were a number of others.

Q. And you held a very minor position?

A. I would not say it was a very minor position. The hydraulic engineers who had originally drawn up the program were in war service, and I had some extremely important work to do myself. I admit I was one of them.

Q. This paper you talk about you worked on, was written by Professor Woodward?

A. Professor Woodward was in charge, but I worked in his office.

Q. Were not there at least a dozen other engineers working on that?

A. Not on that technical report.

Q. On that data?

A. No.

Q. Do you know Mr. McWhorter here?

A. Yes, indeed.

Q. Do you remember him being there?

A. He mentioned to me today being there, and I have a vague recollection of it, but not clear.

Q. Do you mean to say you were not in any position other than a very minor assistant in the Miami Conservancy District?

A. I do not say very minor, but I was assistant engineer.

Q. And you did not have anything to do with the study of waves there with respect to a hydro-project?

2426 A. There was no hydroelectric work in the Miami Conservancy District. We studied waves in the river.

Q. The whole question was the building up of walls alongside where the river flows through the City of Dayton and further back, for the protection of another great flood of the character that they had?

A. That was only a part of the project.

Q. What was the other work?

A. The design of reservoirs.

Q. It was purely a flood control?

A. Yes.

Q. It was not in a mountainous country, either, was it?

A. No.

Q. It had nothing to do with power, did it?

A. No.

Q. Now then, I believe you went to the Great Northern Railroad, did you not?

A. Yes.

Q. What did you do there?

A. That was one of my first engagements when I was a young graduate just out of college.

Q. What kind of work were you doing?

A. I was appointed as a draftsman, sent out on the construction line in the office of the resident engineer. The resident engineer became sick, and I had to assume practically all the duties of that office.

Q. You did not have any wave studies there, did you?

A. No, except I will qualify that by saying we were very much interested in floods on the Snoqualmie River. It was my duty to locate the grade line of that river above the flood heights, and a part of my duty was to investigate that matter.

Q. I believe you went in 1914–15 with the Pennsylvania Railroad Company?

A. Yes.

2427 Q. And that was on the Wabash?

A. Yes.

Q. Your next was consulting engineer with the City of Pittsburgh, was it not?

A. Yes.

Q. What did you do on that job?

A. I made studies to determine the effect of certain proposed river walls at Pittsburgh on a flood height in the Pittsburgh district.

Q. And that did not have anything to do with hydroelectric problems, did it?

A. No, but it had to do with floods and rivers.

Q. Your whole duty was building up walls?

A. Yes, and to determine how those walls would be affected by the flood in the river.

Q. It did not have anything to do with the question of current other than the effect of current on a side wall?

A. We made studies up and down the river for many miles, an intricate study involving the behavior of floods, in the Pittsburgh district.

Q. I believe you said you had a position—that was 1927; how long were you in that job?

A. Do you mean by the City of Pittsburgh?

Q. Yes.

A. I worked on that—my impression is, in my spare time, about six months—all my spare time.

Q. You were teaching at the time, were you not?

A. Yes.

Q. How long were you occupied in your classes?

A. Fifty minutes—do you mean in the classes?

Q. No, I mean how many hours a week?

A. Oh, I think the hours of teaching run about 18—15 in the day and 3 at night.

2428 Q. Any professor who carries 18 hours a week has a pretty busy life, hasn't he?

A. Yes.

Q. You did not have much time to go on?

A. I worked day and night, Saturdays and Sundays, on that job.

Q. In 1928 you went to Philadelphia, didn't you?

A. Yes.

Q. What did you do there?

A. I had charge of the investigation and survey of the Delaware River.

Q. Did you give up your position of teaching?

A. No. I went to Philadelphia during the summer, and during the subsequent winter I worked on the report in my spare time.

Q. So the only time you were working in Philadelphia on a practical job was in the summer?

A. Yes.

Q. And that was how many months?

A. About four, or a little less.

Q. Four months?

A. Yes.

Q. Did you still have a job in Pittsburgh with regard to the flood problem there?

A. No, not during that summer.

Q. So that winter all you had was teaching 18 or 19 hours a week?

A. Yes.

Q. And writing this report?

A. Yes.

Q. You spoke about setting up this model testing plant in the Carnegie Tech, didn't you?

A. Yes, sir.

Q. What was that, what does it consist of?

A. You mean the laboratory?

2429 Q. Yes.

A. It is a Hydraulic Laboratory of the Carnegie Institute. We have pumps, flumes, tanks, etc., for testing hydraulic models, and measuring the amount of water.

Q. You can set up a model and make a test without ever looking at the proposition?

A. If we have proper maps supplied to us we can.

Q. As a matter of fact that is done there, and also done in Washington the same way, set up a model without the men ever having gone out on the project itself?

A. That is done, however we prefer to visit the project.

Q. It is a fact you set up an integrating model with respect to the Bluestone project before you ever saw it, didn't you?

A. With respect to New River, oh yes.

Q. And you made tests before you saw New River?

A. Yes, sir.

Q. And before you ever saw Bluestone reservoir site?

A. Yes, sir.

Q. So it is a purely theoretical proposition, isn't it, that kind of work?

A. I don't know what you mean by that.

Q. It isn't a practical operation, you never built a plant, a hydroelectric plant, did you?

A. No.

Q. Never operated one either?

A. Not until I operated this one the other day.

Q. You don't call that operating, do you?

A. No.

Q. How big is this model you speak of, how long is it?

By Mr. **Jackson**:

The Bluestone model?

2430 By Mr. **Thompson**:

Any kind of model.

Q. You said you made models, how big are they?

A. On the Emsworth project we have one 88 feet long and about 28 feet wide.

Q. How long was the one you made for the Bluestone project?

A. We have three different models for the Bluestone project. One is about 30 feet by 13 feet. Another is a model of the spillway section in a glass flume about 30 feet long and 6 or 7 feet deep and 2 feet wide.

Q. And you compress then the distance or extent of the country for about say thirty-five or thirty-six miles into something that is about thirty-five feet long?

A. Yes, we can do that.

Q. Then you make your test on that?

A. Yes, sir.

Q. And you have not got any of the conditions such as the physical conditions around Bluestone in front of you, such as the stream flow and run-off and things of that kind?

A. Yes. When we make a model we have complete information of that kind.

Q. Where do you get your information regarding stream flow?

A. From the U. S. District Engineer office of the War Department. They furnish the information. As I said we have six men or possibly more now from the War Department working in our Laboratory all the time, and they correspond with their Home Office and survey parties and obtain data on the whole project.

Q. Where do you get your information with regard to stream flow?

A. From whatever source it is available.

Q. Do you get it from the Geological Survey?

A. It depends on the particular job we are working on.

2431 Q. Supposing it is on New River. Did you get it from the Geological Survey?

A, We got it directly from the U. S. Engineer office. I don't know where they got it.

Q. You accepted that?

A. On the design of the Bluestone project, yes, sir, as the only information available.

Q. You are not employed by the United States Government?

A. No, I don't suppose so.

Q. Your arrangement is with Carnegie Tech?

A. No, with Hydraulic Laboratory of Carnegie Tech.

Q. That is a subdivision of Carnegie Tech?

A. Yes, sir. It happens I am however responsible head of that, and keep our finances separate from the Institute, and I made the contracts and sign them myself.

Q. But you don't draw any salary from the U. S. Government?

A. No, we make the models under contract, and my time is included among other things.

Q. But the Carnegie Institute, that division makes the model, and you happen to be the head of that division, is that it?

A. Yes, sir.

Q. Are you retained by the defendant in this case to testify here?

A. The defendant?

Q. That is the Appalachian Electric Power Company.

A. Yes, sir.

Q. What were you doing down at Emsworth?

A. When?

Q. You said you had some work at Emsworth.

A. We are making model studies in connection with the reconstruction of the dam.

2432 Q. How long have you known the Emsworth District?

A. Oh, I have lived in Pittsburg approximately thirteen years and probably went down to Emsworth the first year or so I was there. I have been there many times.

Q. They had the dam constructed long before thirteen years ago?

A. The Emsworth dam was constructed in 1921, the present dam.

Q. Do you know anything about the configuration of the channel of that river at Pittsburg?

A. Yes, sir.

Q. What is the base down at Emsworth of the channel?

A. Below Emsworth there is a deep hole in the channel below the dam.

Q. I mean right at Emsworth, what is the channel base made of?

A. It is a gravel channel.

Q. It is sandstone rock, isn't it, solid all the way across?

A. No, not right at the surface. They had to drive through a number of feet of gravel to reach the rock.

Q. You don't know what the condition of the river was before they had the dam there, do you?

A. Only in a general way.

Q. Do you mean to tell me that you were Consultant on the building of this dam at Emsworth, Pa., on the Ohio River, a few miles below Pittsburg, and that you had a gravel bed before you got to the sandstone rock?

A. I was not Consultant on the Emsworth dam. We are making model tests at the present time on that dam.

Q. These model tests—isn't it a fact what you do is to simply see that at the spillway the water that comes over there, whether it will cut into flows from the dam and cause a leak or a break-down?

A. That is part of what we do.

Q. What else do you do?

A. Many other things.

2433 Q. What else are you doing on the Bluestone?

A. Studying effect of cavitation, the forming of cavities.

Q. That is caused by dropping or falling water?

A. Yes, sir, and we are making another study to determine the best height of the coffer dams of the Bluestone, and another study to determine the proper curvature of the deflectors at the end of the outlet conduits.

Q. None of those problems have anything to do with wave studies made by power projects?

A. No.

Q. You don't know what the power capacity of the Bluestone is to be?

A. I paid no attention to that side of it. I don't think the design for that is prepared, at least not reported to me.

Q. They have preliminary plans?

A. We have nothing to do with the power end of it.

Q. You have not looked at the preliminary maps of it?

A. We have many maps of the site but have done nothing on the power end of it at our Laboratory.

Q. I think you said you made a study of #4 on the Monongahela River?

A. Yes, sir.

Q. That had to do with a power company, didn't it?

A. No, that is a navigation dam on the Monongahela River.

Q. So that had nothing to do with wave studies?

A. No.

Q. You also said you made a study on the Alleghany River?

A. Yes, sir.

Q. Where is the plant on the Alleghany located?

A. East Brady, Pa.

Q. That had nothing to do with wave studies?

A. No.

2434 Q. How about the Gallipolis plant, what were you doing down there?

A. We made studies on methods of controlling the direction of the velocity of currents at locks and (interrupted).

Q. That had to do with the water going through locks?

A. Yes, sir; and we also made studies of the roller gates, to determine a schedule of operation of roller gates, and a study to determine the pressure on the roller gates.

Q That had nothing to do with the effect of the waves downstream, below where the roller gates were?

A. No.

Q. Or the waves coming in from up above?

A. No.

Q. The fact is, you have had practically no experience with this question of wave study, have you?

A. I have had very extensive experience with wave studies.

Q. With respect to power plants?

A. No; the general waves in open channels.

Q. They are not like the waves from power plants, where you have peak loads?

A. They are the same hydraulic problem.

Q. They are in no sense uniform in their procedure downstream, are they?

A. No.

Q. And that is open channel work to a great extent too, isn't it?

A. Yes, sir.

Q. Is that the same condition as where you have a situation like you have on New River, where you have the Bluestone which may be operated, and the Radford project, where they are building one, and where you have the Buck and Byllesby up above working on peak loads; you don't have any such condition in these streams you speak of, where you have made studies, such as on the Monongahela and Alleghany Rivers?

A. Not exactly like that.

2435 Q. Professor, yesterday I asked you about your experience at the Miami Conservancy District. You knew that Col. Edward A. Deeds was Chairman of the Board of Directors there, didn't you?

A. Yes.

Q. I think you stated you went there and worked during the summer of 1918?

A. My recollection is 1918; it may have been 1917. I said that from memory, and did not look up the record. I can't say now whether it was 1917 or 1918. It was during the war, at a time shortly before the Armistice was signed.

Q. You stated, didn't you, the reason why you went there was because there was a shortage of engineers due to the war, and that there had been vacancies left there?

A. That was not the reason I went there. It was a condition that existed there when I arrived there.

Q. Isn't it a fact that Col. Deeds had all of these engineers on that project placed upon a priority, and not a single one of them, with one exception, withdrew or had withdrawn from that Miami Conservancy work?

A. I don't know that.

Q. And did you know a man by the name of Kenneth Grant, as one of the engineers?

A. I don't know him personally, but I know him by reputation.

Q. You would not be able to say that he was the only one who left there of that group of engineers?

A. I know Mr. Ross Riegal was absent.

Q. But he was not absent owing to the war?

A. I don't know. My impression is some reason connected with the war, but I am not certain of that.

Q. So you would still persist in saying there were a great many openings for engineers?

2436 A. I do not know about a great many openings, but I know that when I came there there was nobody I could consult on technical features of hydraulic design except Professor Woodward, who was not there when I first came there.

Q. In "Who's Who" I believe you claim to be the joint author of this article we were discussing yesterday, this technical report No. 7?

A. I didn't know that I was mentioned in "Who's Who."

Q. In engineering?

A. I don't know about that. I never knew I was mentioned in "Who's Who" in engineering.

Q. You never sent in your statement about articles of which you were the author?

A. No, I have no recollection of it.

Q. You do not claim then to be the coauthor?

A. No. I worked on that manuscript and wrote the original version of that manuscript. I was the author of the manuscript under the direction of Professor Woodward.

Q. Isn't it a fact that all the data on that whole report was collected under Professor Woodward, and all you did was to assemble it?

A. No. I actually wrote the report—the greater part of it. There was a certain amount of it written after I left there, but the greater part of it was written by me that summer.

Exhibit No. 146—Views of shoals and rapids on unimproved section of New River between Wiley Falls, mile 88.6 and Radford, mile 146.1—July 13–15, 1936 (original exhibit)	3445	2714
Exhibit No. 147—Views of shoals and rapids on unimproved sections of New River between Wiley Falls, mile 88.6, and Radford, mile 146.1, and between Allisonia, mile 173.3, and Austinville Lead Mine, mile 190.0—June 22–29, 1936 (original exhibit)	3445	2714
Exhibit No. 148—Photograph of stern of boat showing type of propeller guard in July 1936 (original exhibit)	3445	2714
Exhibit Nos. 149–151, inclusive—Photographs of Gerdes' Party at Bull Falls in July 1936 (original exhibit)	3445	2714
Exhibit Nos. 152–154, inclusive—Photograph of Negro at Bull Falls in a rowboat in July 1936 (original exhibit)	3445	2714
Exhibit No. 155—1926—House Doc. #308, 69th Congress, 1st Session—Estimate of cost of examinations, etc., of streams where Power Development appears feasible (original exhibit)	3445	2714
Exhibit No. 156—Record of hearing before State Corporation Commission containing application and copy of State license (original exhibit)	3445	2714
Exhibit No. 157—Pilot license of John R. Douglass (read into the record) (omitted)	3445	2715
Exhibit No. 158—Map—"Parts of National Forests and Areas approved as National forests within the Kanawha River and New River watersheds" (original exhibit)	3445	2715
Exhibit No. 159—1922, June 12, letter from Geo. Otis Smith, Director U. S. G. S., including the Report #34 enclosed in said letter (excluded)	3445	2715
Exhibit No. 160—Map "Monongahela National Forest—West Virginia" 1936 (excluded)	3445	2715
Exhibit No. 161—"Graph of stream flow—storm of March 26, 1936—Bent Creek Experimental Forest" (original exhibit)	3446	2715
Exhibit Nos. 163–182, inclusive—"Photos of dams and reservoirs on upper New River showing silt deposits" (original exhibits)	3446	2715
Exhibit No. 183—Views of pools, shoals, rapids, and dams of Kanawha River and New River between London Lock, W. Va., and Hawks Nest, W. Va.—July 22, 1936 (original exhibit)	3446	2715

Record from D. C. U. S., etc.—Continued.

Plaintiff's exhibits—Continued.

	Original	Print
Exhibit No. 184—Photograph entitled "State line in vicinity of Round Bottom Branch" (original exhibit)	3447	2715
Exhibit No. 185—U. S. G. S. "Peterstown sheet" (original exhibit)	3449	2715
Exhibit Nos 186–187—Maps and deed descriptions, re Bluestone reservoir (original exhibits)	3451	2718
Exhibit No. 188—Key property map of A. E. P. Co. for Bluestone reservoir (original exhibit)	3452	2718
Exhibit No. 189—Report (pp. 3–4, 9–39) of Commissioners appointed to view certain rivers within Commonwealth of Virginia (original exhibit)	3454	2718
Exhibit No. 189–A—Map accompanying exhibit No. 189, John Marshall report (original exhibit)	3478	2735
Exhibit No. 190—Series of maps entitled "New River Survey, 1872 and 1878" (original exhibit)	3478	2735
Exhibit No. 191—Kanawha Valley Power Company license for project #1175 W. Va., including London and Marmet Dams (original exhibit)	3478	2735
Exhibit No. 192—Views of pools, shoals, and rapids on New River between Hinton, West Virginia, and Narrows, Virginia—July 19–20, 1936 (original exhibit)	3478	2735
Exhibit No. 193—Views of pools, shoals, and rapids on New River between Narrows, mile 101.0, and Allisonia, mile 172.0—July 9–13, 1936 (original exhibit)	3478	2735
Exhibit No. 194—Photostat of the chart from automatic gage, at Caperton, W. Va., for period August 8 to August 21, inclusive (original exhibit)	3478	2735
Exhibit No. 195—Blueprint of the recording gage chart at Kanawha Falls, for period July 30 to August 24, inclusive, 1930 (original exhibit)	3478	2736
Exhibit No. 196—Profile of New River, N. C., W. Va. and Va. (original exhibit)	3479	2736
Exhibit No. 197—Map styled "Railroads" (original exhibit)	3481	2736
Exhibit No. 198—Map entitled "New River, Va. and W. Va., Navigation improvements between Hinton and Wilson Creek, 1877 to 1889" (original exhibit)	3482	2736
Exhibit No. 199—Load curve of the Appalachian Electric Power Co. for week ending November 3, 1935 (original exhibit)	3484	2736
Exhibits Nos. 200–200–B—3 prints, U. S. Eng. Office, Huntington, W. Va., showing navigation features (barge lift, log chute, etc.) for Bluestone reservoir project (original exhibits)	3486	2736

Record from D. C. U. S., etc.—Continued.

Plaintiff's exhibits—Continued.

	Original	Print
Exhibit No. 201—Map showing existing ferries below the mouth of Wilson Creek on New and Kanawha Rivers (original exhibit)	3486	2736
Exhibit No. 202—Map showing ferries in operation prior to 1935 (original exhibit)	3486	2737
Exhibit No. 203—Photograph album of ferries on New River (original exhibit)	3486	2737
Exhibit No. 204—Illustration showing how Radford project could affect operating results of Bluestone development (original exhibit)	3486	2737
Exhibit No. 205—Photograph taken to show or to determine the direct measurement thickness of sediment in Byllesby reservoir (original exhibit)	3486	2737
Exhibit No. 207—Sedimentation map of Washington Mills reservoir showing original and present contours (original exhibit)	3486	2737
Exhibit Nos. 208–209—Topographic maps of sections of Washington Mills reservoir showing conditions—April 17 and April 23, 1936—after break-down (original exhibits)	3486	2737
Exhibit No. 210—Cross sections showing profiles on two ranges across the Washington Mills reservoir as of 4/17, and again on 4/23, 1936 (original exhibit)	3487	2737
Exhibit No. 211—Columnar sections of borings through sediment of Washington Mills reservoir (original exhibit)	3487	2737
Exhibit No. 212—Sedimentation map of Byllesby reservoir (original exhibit)	3487	2738
Exhibit No. 213—Chart showing longitudinal profiles of Byllesby reservoir (original exhibit)	3487	2738
Exhibit No. 214—Map of Buck reservoir showing present shore line (original exhibit)	3487	2738
Exhibit Nos. 215–217, inclusive—Cross section showing original and present profiles of the Buck reservoir (original exhibits)	3488	2738
Exhibit Nos. 218–220, inclusive—Cross sections showing the original and present profiles of Fields Mfg. Co.'s reservoir (original exhibits)	3488	2738
Exhibit Nos. 221–221–E, inclusive—Charts of the Ohio River, Pittsburgh, Pa. to mouth showing topography and soundings (original exhibits)	3488	2738
Exhibit No. 223—Federal Power Commission, National Power Survey, Principal Generating Plants and Electric transmission lines, United States, 1935 (original exhibit)	3488	2738
Exhibit No. 225—1 page—"Energy transactions between Appalachian Electric Power Co. and interconnected systems, 1934	3490	2738

Record from D. C. U. S., etc.—Continued.

Plaintiff's exhibits—Continued.

	Original	Print
Exhibit No. 226—Chart—"Study showing operation of Radford with stream flow conditions, as of the week ending Sunday, November 2, 1930, based on load curve, shape proportional to system load reported by Appalachian Electric Co., for week ending November 3, 1935" (original exhibit)	3491	2739
Exhibit No. 227—Map—"Appalachian Electric Power Co., wave study, New and Kanawha Rivers, March 1930" (original exhibit)	3493	2739
Exhibit No. 228—Map—"New River and Kanawha River Power Waves, March 11 to April 3, 1930" (original exhibit)	3493	2740
Exhibit No. 229—Chart—"Automatic Gauge Records, London and Marmet June 15–19, 1936" (original exhibit)	3495	2740
Exhibit No. 229-A—Corrected Exhibit No. 229 (original exhibit)	3495	2740
Exhibit No. 230—Profile of London, Marmet, and Dam No. 6 pools for June 16, 1936 (original exhibit)	3495	2740
Exhibit No. 230-A—Corrected Exhibit No. 230 (original exhibit)	3495	2740
Exhibit No. 231—Letter dated March 1, 1928, Curtis, Mallet-Prevost, Colt, & Mosle to Federal Power Commission, re Project No. 739, A. E. P. Co. (original exhibit)	3495	2740
Exhibit No. 232—Executive Order of the President authorizing the construction of the Bluestone reservoir project on New River (original exhibit)	3495	2740
Exhibit No. 233—Letter from Wm. W. Belknap, Secretary of War, in answer to the resolution of the House, on February 3, 1871, House Document No. 110, concerning James River and Kanawha Canal (original exhibit)	3495	2740
Exhibit No. 234—"The Congressional Globe"—1873, page 204 and page 206, adoption of resolution offered by Senator Windom (original exhibit)	3495	2740
Exhibit No. 235—"Journal of the House of Delegates of the State of West Virginia for the 11th Session, 1872–3" re James River and Kanawha Canal (original exhibit)	3495	2741
Exhibit No. 236—Report of the Committee of the House of Representatives, containing report No. 76 of the 3rd session of the 42nd Congress, re James River & Kanawha Canal (original exhibit)	3496	2741
Exhibit No. 237—"Congressional Record," Special Session of the Senate of the United States, March 4 to 26, 1873, Volume #1, re James River and Kanawha Canal (original exhibit)	3496	2741

D. C. U. S., etc.—Continued.

s exhibits—Continued.

Exhibit No. 255—Letter dated November 17, 1927, to Major E. D. Ardery from F. W. Scheidenhelm on "New River Development No. 6 (Radford), Geological Examination" (original exhibit)	3575	2749
Exhibit No. 256—Letter dated October 16, 1931, to Major Fred W. Herman from F. W. Scheidenhelm, pertaining to maintaining pool levels at dams 2, 3, and 4 on Kanawha River (original exhibit)	3575	2749
Exhibit No. 257—Letter dated September 18th, 1934, to Major John F. Conklin on subject of "Hydroelectric project of Appalachian Electric Power Company on New River near Radford, Va.," by F. W. Scheidenhelm (original exhibit)	3576	2749
Exhibit No. 258—Letter of April 2, 1936, to Major John F. Conklin on "Radford Hydro Project of Appalachian Electric Power Company, Capacity Curve of Reservoir," by F. W. Scheidenhelm (original exhibit)	3576	2749
Exhibit No. 259—Letter dated April 12, 1932, to Major Fred W. Herman, on New River Power Wave Study, by F. W. Scheidenhelm (original exhibit)	3576	2750
Exhibit No. 260—Letter dated April 20, 1932, to United States Engineer Department, signed by Daniel W. Mead and F. W. Scheidenhelm, re "New-Kanawha River Power Wave Study" (original exhibit)	3576	2750
Exhibit No. 261—Telegram dated December 10, 1930, addressed to F. E. Bonner, Executive Secretary, Federal Power Commission, sent by F. W. Scheidenhelm (original exhibit)	3576	2750
Exhibit No. 263—Letter signed by John F. Conklin, Lt. Col., Corps of Engineers, District Engineer, addressed to Kanawha Valley Power Company, "Kanawha River pool fluctuations resulting from operation of the Marmet and London hydro-plants"	3576A	2750
Exhibit Nos. 264–A, B, C—Aerial photographs of New River from Hinton, W. Va. to Narrows, Va. (original exhibits)	3577	2752
Exhibit No. 265—Document on Report on Application for License, Federal Power Project No. 1175, West Virginia, to Chief of Engineers, U. S. Army, Washington, D. C., dated Feb. 24, 1932, at St. Louis, Mo. (changed to defense exhibit No. 525 as it was already in evidence) (original exhibit)	3577	2752

ecord from D. C. U. S., etc.—Continued.

Plaintiff's exhibits—Continued.	Original	Print
Exhibit No. 266—Dated March 12, 1932, informal comment upon the report of the United States Division Engineer at St. Louis, Feb. 24, 1932, on application of Kanawha Valley Power project No. 1175, West Virginia, by F. W. Scheidenhelm, consulting engineer for applicant (original exhibit)	3577	2752
Exhibit No. 271—Copy of protest to A. E. P. Co. against application of town of Galax, Va., for grant and loan from Government for construction of municipal hydro and diesel engine power plant and distribution system (original exhibit)	3577	2753
Exhibit No. 272—Letter dated April 9, 1932, from George Otis Smith to Mr. Thompson (original exhibit)	3578	2753
Exhibit No. 273—Book of aerial photographs of New River, W. Va., Va., and N. C. (original exhibit)	3578	2753
Exhibit No. 274—An Act approved May 6, 1887, incorporating the New River Steam Boat Company, and authorizing them to operate a steam boat on New River (original exhibit)	3578	2753
Exhibit No. 275—Act of February 3, 1888, of the General Assembly of Virginia, to authorize the Radford Land and Improvement Company to erect a dam across New River (original exhibit)	3578	2753
Defendant's exhibits:		
Exhibit Nos. 500–504—Discharge hydrographs, a wave study of New River (original exhibits)	3579	2753
Exhibit No. 505—Document dated May 9, 1927, New River Development Company—Record for minutes (original exhibit)	3579	2753
Exhibit No. 506—Copy of 7th Annual Report of the Federal Power Commission 1927 (original exhibit)	3579	2753
Exhibit No. 507—Gage recorder chart of Kanawha River at Kanawha Falls, W. Va., for the period July 6 to 13, 1936, incl. (original exhibit)	3579	2753
Exhibit No. 509—House Doc. No. 190, 70th Congress, 1st Session (original exhibit)	3579	2754
Exhibit No. 510—Letter dated Feb. 5, 1927 from Major H. M. Trippe to F. W. Scheidenhelm (original exhibit)	3579	2754
Exhibit No. 511—Letter dated February 4, 1927 from F. W. Scheidenhelm to Major H. M. Trippe (original exhibit)	3579	2754
Exhibit No. 512—House Doc. No. 91, 74th Congress, 1st Session (original exhibit) (same as exhibit 145, a part of which is set forth at fol. 3419 herein)	3579	2754
Exhibit No. 513—Chart—Power Waves on New and Kanawha Rivers (original exhibit)	3579	2754

Record from D. C. U. S., etc.—Continued.

Defendant's exhibits—Continued:

	Original	Print
Exhibit No. 514—Letter dated October 29, 1931, from F. B. Duis to F. W. Scheidenhelm re pool levels on Kanawha River (original exhibit)	3580	2754
Exhibits Nos. 515–517, inclusive—Photographs of certain sections of New River (original exhibits)	3580	2754
Exhibit No. 518—Dublin, Va., W. Va., U. S. G. S. Quadrangle sheet	3580A	2754
Exhibit No. 519—Scarborough's New Census Map of Virginia, West Virginia, Maryland, Delaware, and District of Columbia (original exhibit)	3580B	2754
Exhibit No. 520—Map entitled "The Middle Atlantic Group comprising Virginia, West Virginia, Maryland, Delaware, and District of Columbia," published by National Power Survey (original exhibit)	3580B	2755
Exhibit No. 521—Map of Virginia, Maryland, Delaware, and District of Columbia, published by National Map Co., Indianapolis, Indiana (original exhibit)	3580B	2755
Exhibit No. 522—Randall McNally Map of Virginia (original exhibit)	3580B	2755
Exhibit No. 523—Map entitled "Commonwealth of Virginia, State Highway System, State Highway Commission, July 1936" (original exhibit)	3580B	2755
Exhibit No. 524—Map of Giles County, Commonwealth of Virginia, Department of Highways, Richmond, Va. (original exhibit)	3580B	2755
Exhibit No. 525—Copy of a report on application for license, Federal Power Project No. 1175, W. Va., dated Feb. 24, 1932 (original exhibit)	3580B	2755
Exhibit No. 526—Photograph of Shumate Falls (original exhibit)	3581	2755
Exhibit No. 527—Map dated 11/21/1912. Reconnaissance Map of New River from Hinton, W. Va., to Radford, Va., compiled under direction of Major F. W. Alstaetter. (Same as original exhibit 558–G)	3581	2755
Exhibit No. 528—Report of Major Craighill, Corps of Engineers, U. S. A. dated April 17, 1891	3583	2755
Exhibit No. 529—Letter dated February 4, 1930, addressed to Federal Power Commission, signed Appalachian Electric Power Company, by Curtis, Mallet-Prevost, Colt & Mosle	3589	2760
Exhibit No. 530—Memorandum, re Federal Commission's authority to adopt a policy of issuing a minor part license for projects located on non-navigable streams and not involving the use of any land or other property of the United States, dated February 4, 1930	3589C	2762

Record from D. C. U. S., etc.—Continued.

Exhibit No. 556—Annual report of the President and Directors of the Board of Public Works to the General Assembly of Virginia, in pursuance of an act, entitled "An act creating a fund for internal improvements" (original exhibit)	3605	2814
Exhibit No. 557—Pages 140 and 141 of the Journal of the Virginia House of Delegates for 1817–18 containing a portion of the report of the House Committee on roads and inland navigation brought in on January 21, 1818 (original exhibit)	3605	2814
Exhibit Nos. 558–A–558–G—Map dated November 21, 1912, survey made by Major F. W. Alstaetter, Corps of Engineers. Sheets 1 to 7, inclusive, of the Alstaetter map dated November 21, 1912, marked, respectively, 558–A to 558–G (original exhibits)	3606	2814
Exhibit No. 559—Pages from the Report of the Chief of Engineers for 1875	3606–A	2814
Exhibit No. 560—Report of Chief of Engineers, 1887	3607	2823
Exhibit No. 561—Report of the Chief of Engineers for the year 1888, pages 225, 226, 1760, 1761 (original exhibit)	3612	2832
Exhibit No. 562—Report of the Chief of Engineers for the year 1889, pages 261, 262, 1961, and 1962 (original exhibit)	3612	2832
Exhibit No. 563—Report of the Chief of Engineers for the year 1890, pages 235, 236, 2249, 2250, 2251 (original exhibit)	3612	2832
Exhibit No. 564—Report of Brigadier General Casey, Chief of Engineers, United States Army, to the Secretary of War, dated November 16, 1894, to which is attached a third endorsement by Col. Craigbill's underlying report, and also a second endorsement	3614	2832
Exhibit No. 565—Letter from the Secretary of War dated Dec. 16, 1903, transmitting letter from Chief of Engineers including report made by him on New River	3618	2835
Exhibit No. 566—Memorandum to the Secretary of War by Gen. Black, Chief of Engineers, dated May 19, 1916	3623	2840
Exhibit No. 567—Page 1284 of the Annual Reports of the Chief of Engineers of the War Department, year 1917 (original exhibit)	3634	2849
Exhibit No. 568—Copy of letter dated July 1, 1925, addressed to Mr. C. Bascom Slemp, and signed by O. C. Merrill, Executive Secretary of Federal Power Commission	3634–A	2849

Record from D. C. U. S., etc.—Continued.

Defendant's exhibits—Continued.

	Original	Print
Exhibit No. 569—Letter dated July 3, 1925, addressed to Honorable O. C. Merrill, Exec. Secy., F. P. C., Washington, D. C. and signed by C. B. Slemp (original exhibit)	3634–B	2850
Exhibit No. 570—Letter dated October 24, 1925, addressed to the Federal Power Commission, Washington, D. C., and signed by Curtis, Mallet-Prevost, Colt, and Mosle	3634–C	2850
Exhibit No. 571—Letter of October 24, 1925, addressed to Major General Harry Taylor, Chief of Engineers, War Department, Washington, D. C., signed by Curtis, Mallet-Prevost, Colt & Mosle, as counsel for the Appalachian Electric Power Co., or its predecessors	3634–D	2851
Exhibit No. 572—Report of Major General Taylor, Chief of Engineers, dated December 29th, 1925, addressed to the Executive Secretary of the Federal Power Commission, Washington, D. C. (text of this exhibit is same as Government Exhibit No. 97) (original exhibit)	3604–E	2851
Exhibit No. 573—"Defendant's Exhibit No. 505" identified by Col. Edgerton as a part of the minutes subsequently printed as the minutes of the meeting of June 1, 1927 (original exhibit)	3635	2851
Exhibit No. 574–A—Photostat of letter of July 1, 1927, from Federal Power Commission, addressed to Curtis, Mallet-Prevost, Colt & Mosle, signed by O. C. Merrill, Executive Secretary bearing reference "Ep–739–VA Appalachian Electric Power Company"	3635–A	2852
Exhibit No. 574–B—Certified copy of a part of the minutes of the 88th meeting of the Power Commission held on the first day of June 1927	3635–B	2852
Exhibit No. 574–C—"Federal Power Commission, Washington, D. C. License on Navigable Waters, Project No. 739, Virginia, Appalachian Electric Power Co." with it is a form of license consisting of 16 pages (original exhibit)	3635–C	2853
Exhibit No. 575—Letter dated March 1, 1928, to Hon. Dwight F. Davis, Secy. of War, Hon. Hubert Work, Secy. of Interior, Hon. Wm. N. Jardine, Secy. of Agriculture, constituting the Federal Power Commission, and signed A. E. P. Co., by Curtis, Mallet-Prevost, Colt & Mosle (original exhibit)	3635–D	2853
Exhibit No. 576—Letter dated March 5, 1930, to Lt. Col. M. C. Taylor, Chief Engineer, Federal Power Commission, Interior Building, Washington, D. C., and signed by F. W. Scheidenhelm (original exhibit)	3635–D	2854

Record from D. C. U. S., etc.—Continued.

Defendant's exhibits—Continued.

	Original	Print
Exhibit No. 577—Photostatic copies of pages 6, 7, 8, and 9, of the Tenth Annual Report of the Federal Power Commission for the year 1930	3635-E	2854
Exhibit No. 578-A—Letter dated October 3, 1930, to Gen. Brown, Chief of Engineers, and signed by F. E. Bonner, Exec. Secy. (original exhibit)	3636	2857
Exhibit No. 578-B—Letter dated October 10, 1930, to the Exec. Secy., F. P. C., Washington, D. C., signed for the Chief of Engineers, by Hugh J. Casey, First Lieut. Corps of Engineers (original exhibit)	3636	2857
Exhibit No. 579-A—Photostatic copy of letter dated November 5, 1930, to Exec. Secy., F. P. C. and signed by Lytle Brown, Major General, Chief of Engineers	3638	2857
Exhibit No. 579-B—Photostat of report entitled "Second endorsement U. S. E. O. Huntington, W. Va., Oct. 18, 1930, Div. Engineer, Upper Miss. Valley Division, St. Louis, Mo., signed by Major Herman, District Engineer."	3638	2857
Exhibit No. 579-C—Photostat copy of report on navigability of New River, Va. (Huntington District, August 29, 1930). Third endorsement office, Division, Engineer, Upper Miss. Valley Div., St. Louis, Mo., October 24, 1930, to Chief of Engineers, U. S. Army, Washington, and signed George R. Spalding, Lt. Col. Corps of Engineers	3638	2857
Exhibit No. 580—Memorandum dated October 21, 1930, entitled "Memorandum for Exec. Secy." and signed by J. F. Lawson, acting Chief Counsel (original exhibit)	3647	2865
Exhibit No. 581—Document dated October 30, 1930, entitled "Memorandum for the Sec. of Int., Acting Chairman," and signed by F. E. Bonner, Exec. Sec	3647-A	2865
Exhibit No. 582—Photostatic copy of letter dated November 8, 1930, to Hon. John G. Pollard, Gov. of Va., and signed by F. E. Bonner, Exec. Sec	3647-C	2866
Exhibit No. 583—Photostat of letter from Hon. John Pollard, Gov. of Va., to Mr. F. E. Bonner, Exec. Sec., F. P. C., dated Nov. 10, 1930	3647-D	2867
Exhibit No. 584—Letter Jan. 27, 1931, from Curtis, Mallet-Prevost, Colt & Mosle to F. P. C. re Project #739 (original exhibit)	3647-E	2867
Exhibit No. 585—Telegram dated January 28, 1931, from F. P. C., signed by George Otis Smith, Chairman, addressed to A. E. P. Co. (original exhibit)	3647-E	2867
Exhibit No. 586—Photostat of letter dated September 18, 1934, to Sec. of War, Washington, D. C., and signed by A. E. P. Co., by George N. Tidd, President	3647-F	2868

Record from D. C. U. S., etc.—Continued.

Stipulation as to printing of record	3750	2945

2437 HAROLD A. THOMAS

CROSS EXAMINATION

Q. You spoke yesterday, I believe, about the wave from the Radford project being a 24-hour wave?

A. By that I meant in ordinary times such a tide or wave would be released once every 24 hours.

Q. Now, what would be the more forceful—a series of waves going down the river, one following the other, or an isolated wave, so far as the effect on conditions down the river are concerned?

A. I don't know what you mean by the word "Forceful" in that connection?

Q. Well, have power?

A. Do you refer to the amplitude?

Q. Yes—persistence, greater amplitude?

A. I would say an individual wave would have greater amplitude than individual waves of a series.

Q. And would it persist in volume more than a series of waves?

A. I think there would be a tendency for it to persist in volume more. I may qualify that by saying I think an individual wave would be detectable further down the river than the waves of a series. Its rate of reduction in volume, however, might be greater than the rate of reduction of any wave of a series.

Q. That being true, if the project were closed down on, let us say, Saturday afternoon, that last wave would be an isolated wave, would it not?

A. No, I would not call it an isolated wave, since it is adjacent to the Friday wave.

Q. How about the Monday. wave, would that be an isolated wave, the first wave going down? 2438

A. No; that would be adjacent to the Tuesday wave.

Q. How would you describe an isolated wave? Under what conditions would an isolated wave arise?

A. Under conditions such as if the plant at Radford had been shut down for a considerable number of days, and then opened up, and then shut down for a period of days.

Q. Monday's wave would not overlap on Friday's wave, would it?

A. You are referring to a one-day shut-down?

Q. A shut-down of a day and a half—from Saturday noon until Monday morning?

A. Under those conditions it would overlap slightly.

Q. But very slightly, wouldn't it?

A. Rather slightly.

Q. If you had a holiday on Monday, like Labor Day, and you had Sunday and Monday and half of Saturday, there would not be any overlapping?

A. The overlapping would be slight.

Q. But there would still be overlapping?

A. I think the effect of a large wave is perceptible for several days, though smaller.

Q. When did you set up this integrating model that you spoke of for the Bluestone?

A. Late in July.

Q. Of this year?

A. Yes.

Q. How late in July?

A. I can't remember clearly on that. During the latter part of July.

Q. And, up to that time, had you ever been up New River?

A. No.

2439 Q. Was it after you set up this model that you came to New River?

A. Yes.

Q. How much time after you set up the model?

A. Oh, my impression is two or three weeks.

Q. So that would have put you over into August, wouldn't it?

A. Yes.

Q. Is that since you came here to Roanoke and this stay here in Roanoke?

A. I made a trip to Roanoke, and from thence went to Charleston and spent a day or two along the Kanawha River; then returned to Pittsburgh, and then returned to Roanoke about a week ago.

Q. But you had made some of your tests before you came here the first time?

A. A part of the tests.

Q. Describe to the Court this integrating model? Is that it, an integrating model?

A. I call it an integrating model. The integrating model that I constructed of the Bluestone reservoir was made of sheet metal; it was about four feet long and eight inches deep, and three and a half inches at the widest part, which corresponded with the crest of the Bluestone dam. It was the general shape of the Bluestone reservoir with the distorted scales. The vertical scale was not the same as the horizontal scale——

Q. (Interposing.) What was the vertical scale?

A. I did not finish my answer.

Q. All right.

A. The vertical scale was not the same as the longitudinal scale, and the breadth scale was not the same as the other two scales. The model did not represent the Bluestone River reservoir exactly, but approximately. I constructed the model to guide my
2440 own judgment and to check my methods in studying the
1930 series of waves and to check my analysis of the seiches, which might be caused in Bluestone reservoir.

Q. Then you did not construct this model simply for the purpose of assisting the Government in the Bluestone reservoir?

A. No; it had no connection with that.

Q. You constructed it to make sure of your studies?

A. To make sure that my conclusions were correct in this case.

Q. I thought you said Carnegie had been employed (and you as its head) to make a study of the Bluestone entirely aside from the question of this law suit?

A. Yes; we are constructing several models pertaining to the Bluestone for the United States Government. This was something entirely different.

Q. What was the length of this model longitudinally?

A. About four feet.

Q. And that four feet represented 36 miles, didn't it?

A. Yes.

Q. And that 36 miles is the extent up the river that you expect the pools at its head to be?

A. I would like to correct my last answer, in that it represents 30 miles at elevation 1,490. The 36 miles is at an elevation of 1,520.

Q. That 1,490 is the height at which the pool would be filled when there is usable storage, isn't it?

A. Yes; as I understand it.

Q. What was the width of the river that you had for this model?

A. I do not have that figure in mind now, but I obtained
2441 it from United States Geological Survey maps.

Q. What did you reduce the width to?

A. I had a width scale, which I do not have in mind now. It gave the width of the river, of the water, of about one inch, but I would not say it was exactly one inch.

Q. What did you figure the width of the river to be where you had the dam site?

A. I don't have that figure in mind now, but I scaled it on the geological survey map.

Q. Can you give it in percentage as compared with the longitudinal measure?

A. I do not like to give those percentages offhand, but in general——

Q. (Interposing.) Have you any data here that could help you?

A. I think I could look up and probably find my scale figures, and I might say that the scale is such that longitudinally 30 miles is represented by something a little less than 48 inches. Transversely, a half mile will represent roughly the maximum width of the Bluestone reservoir near the dam, and is represented by three and a half inches.

Q. What is the vertical proportion?

A. The depth of the reservoir, which is 125 feet, approximately, was represented by about eight inches.

Q. Well, would not, or would, that make your proportion about 100 to 1 with respect to the vertical and the longitudinal?

A. No; all three scales were different—vertical, longitudinal and transverse.

Q. Wasn't the width distorted in the ratio of about 100 times the depth?

2442 A. I can figure that, if you want me to.

Q. All right.

A. (Witness makes calculation.) According to my figures, the width scale is about 45 times the depth scale. According to my figures, the breadth scale is in the vicinity of one in nine thousand.

Q. How about the length scale?

Mr. Jackson. Is that the relationship between the breadth and the depth scale, or is it a comparison of the distortion of the two scales?

Witness. I put it both ways.

Mr. Jackson. Let me have those again.

Witness. In round numbers the breadth scale is one in nine thousand and the height scale is one in two hundred.

By Mr. Thompson:

Q. Have you given the distortion of the lengths in relation to the depth?

A. In round numbers the length scale is about one in forty-five thousand.

Q. Now, then, what is the relationship of the lengths to the depth scale?

A. That is 200 to 45 thousand which would be 1 to 225.

Q. And that was a distortion, was it, of about 225?

A. Yes.

Q. So you relied on a model in which one dimension was exaggerated 225 times with respect to another?

A. Yes. That sort of exaggeration is peculiar——

Q. (Interposing.) Now, I didn't say——

A. By the term "integrating model" I mean a model in which such distortions are present and in which the model is not
2443 a scale model of the river.

By Mr. Thompson:

Q. So, any result you got there, you would have to follow it up with mathematical refinement to a very great degree, wouldn't you?

A. There has to be a mathematical analysis relating the action of the integrating model to the action of the prototype—that is the actual river or reservoir. The principles of such an analysis are recognized and definite and reliable.

Q. What was the volume of the reservoir in your model?

A. Oh, I don't have that figure in mind.

Q. Do you know what the width of the reservoir was in the model?

A. The maximum width was 3½ inches.

Q. 3½ inches?

A. Yes.

Q. Your model in appearance in no way represented the prototype, did it?

A. No, not at all.

Q. Your results are subject to individual interpretation and approximation, aren't they?

A. I should say so, yes.

Q. So that one person might read these results in one way and another person in an entirely different way?

A. Competent persons who would understand the principles involved would get reasonably equivalent results.

Q. That is your opinion?

A. Yes.

Q. It involves a matter of judgment, too, doesn't it?

A. Yes.

Q. This model of yours, did it extend down the river beyond the dam?

A. No.

2444 Q. Why didn't you extend it down the river?

A. It was made simply to study the effect of seiches on the Bluestone reservoir.

Q. And nothing beyond that?

A. No.

Q. Then it had no use, or, I believe you testified, that you used it in your comparison of a study of the 1930 wave itself?

A. Not that model. That was another model.

Q. You had another model then?

A. Yes. I had three models in connection with the studies in this case.

Q. How about the other model? Did that extend all the way down the river?

A. Yes, I had one model extending all the way down the river.

Q. From where to where?

A. From Byllesby to London. The model was built from Byllesby to Winfield, but I did not fully complete the part from London to Winfield.

Q. How long was that model?

A. Approximately 50 feet.

Q. And representing what length?

A. It represented the length from Byllesby to Winfield. According to my memory, in a rough way that distance is 200 miles.

Q. What were your other dimensions?

A. The scales on that model were: Vertical scale, 1 to 100; longitudinal scale, 1 to 30,000; and transverse scale, 1 to 5,000.

Q. And you did not have the Bluestone dam in that model, did you?

A. No.

2445 Q. Is that what you call an integrating model?

A. Yes, that is what I call an integrating model.

Q. The distortion in that model was 300 in length to depth, wasn't it?

A. Yes.

Q. And, in other words, the exaggeration of the length was 300 times that of the depth?

A. Yes.

By Mr. Jackson:

Q. "Exaggeration;" what does that mean increase or decrease?

A. By that I mean the ratio of the length scale to the depth scale is in the ratio of 300 to 1.

By Mr. Thompson:

Q. What was the bed of the stream composed of?

A. Wood.

Q. And it was perfectly smooth, was it?

A. No.

Q. How was it fixed?

A. It was roughened.

Q. Who advised you how to fix the bed of stream up in a rough way? Where did you get your information?

A. No one advised me.

Q. You had not been up here when you made the model?

A. No, but I had rating curves of the river at various gaging stations.

Q. Would those rating curves give sufficient accuracy to know the channel resistance?

A. Yes, they gave me the information to determine the channel resistance or roughness.

Q. Were they U. S. G. S. curves?

A. I don't know where they were obtained originally.

2446 Q. Where did you obtain them?

A. I obtained them in Mr. Schiedenhelm's office, in New York. I do not know the original source of those rating curves except from conversation that some of them were obtained from United States Engineers.

Q. Will you produce those?

A. I can produce them in two forms—either by copies of the notes furnished me or the originals furnished me.

Q. Well, let us have the originals.

A. (The witness procures papers.)

Q. May I see them, please?

(The papers are handed to Mr. Thompson.)

Q. You used how many stations?

Mr. **Jackson**. What are the curves that were handed over?

Mr. **Gatchell**. New River at Ivanhoe December 15, 1930;
New River at Ivanhoe August 11, 1927;
New River at Allisonia September 26, 1929;
New River at Dam Site A August 6, 1927;
New River at Eggleston October 1, 1920;
New River at Eggleston October 1, 1920;

Mr. **Jackson**. Are they duplicates?

Mr. **Gatchell**. Evidently.
New River at Eggleston October 20, 1914, to September 30, 1920;
New River at Glen Lyn August 10, 1927;
New River near Hinton December 1, 1923;
New River near Hinton without date;
Kanawha River at Kanawha Falls, West Virginia, October 27, 1928, to September 30, 1931.

All of the tables which I have just listed are tables prepared in the United States Geological Survey Water Resources Branch.

There was also handed over a rating curve for New River at Caperton, West Virginia, without date, prepared in the office of the United States Geological Survey, Water Resources Branch.

By Mr. **Thompson**:

Q. Did you have any more rating curves than these?

A. I don't think so.

Q. So what you had were rating curves at Ivanhoe, Radford, Eggleston, Hinton, Caperton, and Kanawha Falls; is that correct—and Allisonia?

A. And Allisonia.

Witness. How about Glen Lyn?

Mr. **Jackson.** Glen Lyn was listed.

Witness. Rating curve at Lock No. 2 was furnished me, but I made no use of it.

By Mr. **Thompson**:

Q. These were all U. S. G. S. data, were they not?

A. Yes.

Q. So you were depending upon—Mr. Schiedenhelm gave you the data from the U. S. G. S. to make all those figures?

A. Yes.

2447 Q. He apparently relied on those figures, didn't he, when he gave them to you?

A. So far as I know.

Q. And you did, too, didn't you?

A. Yes; I considered them reasonably accurate, or approximately accurate, with the ordinary accuracy of such studies.

Q. Now, I believe some of these are figures taken 15 years ago, aren't they, of these data?

A. I did not make a mental note of those dates as you just read them.

Q. The one at Eggleston is dated from October 20, 1914, to September 30, 1020. There may have been records much later than those?

A. Possibly. I don't know.

Q. Are they not frequently changing the records, gathering new data, and so forth?

A. At some stations they do, and at others not.

Q. Did you use this one at Eggleston from October 20, 1914, to September 30, 1920?

A. Yes.

Q. Then you have one here at Eggleston from October 1, 1920, to blank; do you what the blank was?

A. No.

Q. So you were not any more careful than that. You took what was given you?

A. As I explained, this model was built to guide my own judgment. I did not consider it a model to report results with a high degree of precision.

Q. You were coming here to testify on the basis of this
2448 model, and you made all your assertions on the basis of the model?

A. No; my study was made of various things, including the model.

Q. You had not seen the physical condition of the river prior to studying the model, had you?

A. No; but I had seen the rating curve and the results of the 1930 wave tests.

XQ. Do you know anything about boulders down in that river bed, or did you, when you made this model?

A. I had no detailed information about boulders. I realized it was a rough river by the nature of the data I had on it.

XQ. How did you indicate this in the channel of the river in the model?

A. By adjusting the roughness so as to make the rating curves of the model agree with the rating curves of the river.

XQ. Do you put anything of a physical characteristic of the bed on the model?

A. Yes, sir.

XQ. What do you put?

A. Little sheet metal baffles which are inserted in the bed and walls of the channel, and which can be adjusted in and out of the slots to reproduce the correct roughness of the prototype.

XQ. How do you know about this roughness?

A. From the rating curves of the river.

XQ. And that is the only way you do it?

A. Yes, sir.

XQ. Do you know where Sandstone Falls are?

2449 A. Yes, sir.

XQ. Did you represent Sandstone Falls?

A. I adjusted the roughness of the model at the nearest gaging station upstream, which was near Hinton, and at the nearest gaging station below, which was Caperton.

The baffles near Hinton and Caperton were moved in and out until the model gave the correct rating curve at those stations.

I then ran tides down the model corresponding to the 1930 tides and checked the change in the profiles at those tides, and then adjusted the baffles between gaging stations so the model would reproduce the profile or hydrographs of the 1930 tides.

XQ. What was the fall at Sandstone Falls that you adjusted this to?

A. I did not show Sandstone Falls in that model, but just the general friction between Hinton and Caperton.

XQ. Isn't that simply theoretical judgment on your part?

A. An integrating model satisfies the mathematical requirement, it does not have to represent the river exactly. It is not a true scale model.

X Q. Aren't you exercising your own personal judgment, when you sit in a room with the model, adjusting and readjusting it?

A. Two persons expert in that work would arrive at the same result.

X Q. They would if they used the same judgment, wouldn't they? But wouldn't a man who had been over the river, and familiar, like Col. Scheidenhelm is with the river down in the gorge, have had a judgment far better than yours and more accurate in attempting to regulate the bed of the river on this model?

A. No. If I was to build it again it would be the same way, I would do it just the same way.

2450 X Q. You don't think any number of trips on the river, or knowledge of the geology would help you?

A. No; because the fundamental data is the rating curve and wave test.

X Q. Then you throw yourself back absolutely on the rating curves?

A. And the wave tests and the profile and cross sections of the river.

X Q. On the rating curves you take the Geological Survey figures absolutely?

A. Yes, sir.

X Q. And depend on those entirely in that respect?

A. Yes, sir.

X Q. You don't question them at all?

A. I realize the Geological Survey figures are obtained by the use of current meters involving errors in the order of 5%, and occasionally more.

X Q. Now you adjusted the model until it gave the right answer, didn't you?

A. It showed—I reproduced certain waves of the 1930 series sent directly down the river.

X Q. At these various points you speak of?

A. Yes, sir.

X Q. Doesn't your result then only approximate the results on the river at the six stations selected by you?

A. I would hardly know what you mean by that.

X Q. You get only an approximate result?

A. I don't claim perfect precision on those results, but approximate.

2451 X Q. It doesn't give any indication of conditions between those six stations?

A. Yes, sir; something gives me indications of conditions between the stations, and that is the actual waves of the 1930 series.

X Q. So you have to come back each time to the 1930 series?

A. Yes, sir.

X Q. I want to get clear how many visits you have made to New River. When did you first see New River?

A. The first visit I made to New River?

X Q. When was that?

A. I guess about two weeks ago. I don't remember the date.

X Q. Where did you first see it, at what point?

A. At Radford.

X Q. And what time did you start from Radford?

A. Oh in the early morning.

X Q. And you were traveling by automobile?

A. Yes, sir.

X Q. Where did you go?

A. I crossed the New River at Radford—I started from Roanoke early in the morning, and crossed the New River at Radford, and went upstream to the Radford dam site and inspected that, and went from there to the Narrows, followed the river from the Narrows to Glen Lyn, and then along the bank of the river on a dirt road from Glen Lyn to Bull Falls, where I ferried across and followed the bank of the river to Hinton.

X Q. That describes somewhat the trip Mr. Putnam took. Were you with him?

A. No. I hadn't completed my answer. I then at Hinton took a road which crossed the river at Hinton and went through the mountains, behind the left bank of the river, and crossed the river again at a bridge a mile or so below the Hawks Nest
2452 hydroelectric plant. I then went up to the Hawks Nest
plant and visited that and came back to the river and visited the power-station of the Hawks Nest plant and followed the river down from Glen Ferris and visited that station.

X Q. Was this all in one day?

A. No, it was not. I spent a night at a little town called Mount Hope, between Hinton and Charleston.

X Q. How many miles did you cover that day?

A. The rest of the trip was from Glen Ferris to Charleston. I spent the night at Charleston and came up the river again and spent the next day at the London and Marmet plant.

X Q. How many miles did you travel the first day?

A. The first day, going from Roanoke to Mount Hope I don't have a record of the mileage.

X Q. Several hundred, was it not?

A. I don't think so. My feeling is I went about a couple hundred of miles that day.

X Q. A great part of the time you were not in sight of New River, were you?

A. No.

X Q. So you only saw a few spots on the river from the project site down to Hawks Nest?

A. I was practically in continuous view of the river between Glen Lyn and Hinton, about thirty-six miles.

X Q. But up above that, there was about thirty miles you didn't see the river?

A. Yes.

X Q. These are the only times you have seen the river?

A. Yes, sir.

X Q. And when you made this experiment down at the London and Marmet dam, how long were you on that?

2453 A. During two days.

X Q. You were there two days?

A. Yes, sir.

X Q. Did you make the experiment or did someone make it for you?

A. The actual operating of the plant was done by the operatives, however, I laid out the test and directed the volume of water to be run through the plant, through successive hours.

X Q. That is the only time you ever made a test of that kind in your life?

A. Yes.

X Q. The only time you ever saw a test of that kind made?

A. So far as I know it is the only time a test of exactly this kind has ever been made.

X Q. Let us refer for a moment to Defendant's Exhibit #594. Do you have a copy of that?

A. I have the original which I picked up off the floor last night, marked for identification.

X Q. That curve is constructed on the basis of a 9,000 second-foot wave, is it not?

A. Yes, sir; a wave with that peak.

X Q. And you understand that is the way this Radford project is to operate?

A. I understand this is a possible way for it to operate.

X Q. It is possible for the Radford project to operate on a peak load of 9,000 second-feet part of the day and close down for the rest of the day in low water time?

A. Yes, sir.

X Q. And you understand this is the way it will operate from time to time?

2454 A. In this approximate way.

X Q. Now I notice first of all it says "Week day operation," that would indicate, would it not, there would be a different operation on Sundays and on holidays?

A. I should say so.

X Q. Then "3. Carrying reasonably allocated portion of A. E. P. Co. system load." What is the A. E. P. Co. system load let us say in October or November of any year, or taking 1935 for an example?

A. I can't answer that. I do not know what their total system load is. I have seen curves of that but did not make a memorandum of the total.

X Q. When they handed you this paper, Col. Scheidenhelm handed you this, didn't he?

A. Yes.

X Q. Did he explain to you what the reasonable allocation was, or did you just read that and take it and go on with it?

A. If I may explain, the detail of how this paper was received, I was in Col. Scheidenhelm's office in New York City when he called up the operator of the plant or system at Charleston, asking him to furnish him a reasonable load curve for the future operation of the Radford plant, and that, according to my memory, was the only requirement, a future load curve which might be reasonable for that plant.

X Q. That was this paper handed to you subsequently?

A. Yes, sir.

X Q. Who handed this paper to you?

A. Mr. Scheidenhelm or some of his associates.

X Q. Now you went ahead blindly with regard to this carrying a reasonably allocated portion, you didn't go back to find out if it was reasonable or unreasonable?

2455 A. No, except my judgment on that sort of thing tells me it is a reasonable curve.

X Q. How can your judgment tell you if you don't know what the load of the company itself is for any period of time?

A. No answer.

X Q. Supposing that were handed to you and you knew nothing about the load of the Appalachian Electric Power Company, how would you know whether that was reasonable or not?

A. It resembles other load curves which I have seen of systems which are not Metropolitan systems such as New York.

X Q. Isn't it true most of those systems their load curves are practically alike?

A. No, I would not say that.

X Q. You said they resembled it?

A. In a broad way.

X Q. And that is the basis for your conclusion this was a reasonable allocated portion?

A. I used the term reasonable in a general way. This is a reasonable load curve for such system, not in detail, but in general.

X Q. Would the Metropolitan load curve in New York be anything like this out here?

A. It might be quite different.

X Q. What systems does it resemble?

A. I don't think I can answer that specifically, but in my opinion it is a reasonable load curve for a system of a general type such as this system.

2456 X Q. You must have some basis when they hand you a paper of this kind for saying whether it is reasonable. As I understood you, you said something that you do not know about the load curve of the Appalachian Electric Power Company. Am I correct on that?

A. I have seen load curves of the company.

X Q. You don't know, do you?

A. I have seen load curves which I consider or have reason to think are reasonable, which resemble this approximately. There was one introduced in evidence in this case which I have seen which resembles this.

X Q. When did you see that?

A. Oh, recently.

X Q. Are you referring to Exhibit #226?

A. I don't know the number. (Exhibit #226 handed to the witness.) Yes, this is the one.

X Q. You think #594 resembles #226?

A. In a broad way, yes.

X Q. Is this #594 a chart of a part of a system load curve?

A. Yes, sir.

X Q. This shows, doesn't it, a variation from zero to 9,000 second feet?

A. Yes, sir.

X Q. So that you would understand the Appalachian Electric Power Company was going to discharge waves at the Radford plant from zero to 9,000 second feet, from this chart?

A. Yes, sir.

X Q. You will recall this Exhibit #226, and you said that there was a sufficient similarity between the curve on #594 to #226 so that you could draw the conclusion #594 was a reasonable allocated portion of the AEP Co., curve, is that right?

2457 A. In so far as the shape of the curve is concerned.

X Q. Is it any more reasonable than the curve you have shown on Exhibit #226, or are they sufficiently similar to be approximately alike?

A. I should say the latter, they are sufficiently similar to be approximately alike.

X Q. Would you say the mode of operation on #226 as indicated by that chart was as reasonable as the mode of operation on Defendant's Exhibit #594?

A. I can't say one is more reasonable than the other. In my opinion they are both of the same general type.

X Q. Yesterday you testified about two waves, one was a rectangular wave and the other was a triangular wave—that was #594.

A. By triangular you refer to this sort of wave?

X Q. Yes, sir.

By Mr. Jackson. I don't think he called it triangular.

By Mr. Thompson. I called it triangular. I have a one track mind and it looks more like that to me.

By Mr. Jackson. Just as long as we understand the wave doesn't mean triangular, it doesn't make any difference what we call it.

X Q. I believe that wave calls for 9,000 second feet discharge during eight hours?

A. The rectangular one.

X Q. What was the base length of that wave at Radford, of the triangular wave?

By Mr. Jackson. That is #594.

A. 16½ hours if I am not mistaken.

X Q. Do you know what that length is in miles?

A. About fifty miles.

X Q. What was the base length of it at Glen Lyn, if you know?

A. I don't know exactly, but I would say it would be spread out so it would appear throughout the whole twenty-four hours to some extent.

X Q. Could you figure that out now?

A. No, not in any reasonable time.

X Q. Do you know what the base length would be at Hinton?

2458 A. The base length would be twenty-four hours.

X Q. At Hinton?

A. Yes; the wave would have a tail on it, so to speak, which would extend over the full twenty-four hours.

X Q. And that would include Kanawha Falls, too, wouldn't it?

A. Yes, sir.

X Q. What was the volume at Radford of this triangular wave, what would it be, the volume at Radford?

A. I can't answer that without computation.

XQ. Have you ever figured out what it would be?

A. I have made, or I can give you, a rough figure on that.

XQ. Suppose you figure that?

NOTE.—Last two questions read. [Witness figured.]

A. In my opinion it would be roughly 1,800 second-foot days.

XQ. That would be at Radford?

A. I figured that at Hinton. I had in mind you said Hinton. I have no quick way to figure that a Radford. It would be a long computation.

XQ. Didn't you assume [interrupted].

A. At Radford this wave is 3,000 second-foot days.

XQ. What would it be at Glen Lyn?

A. Oh, slightly, in my opinion, in a general way, about—slightly greater than at Hinton, say 2,000 second-foot days, or a little less.

XQ. Was this test being made through your model?

A. No; these figures I am giving you are figures I have in mind which are based on combination of the results I obtained from model tests, and studies of various waves of the 1930 2459 series. It is an opinion rather than a close highly precise computation, it is my general opinion, based on my general study of the problem.

XQ. Just give us an outline of how you arrived at that figure, I think you said 1,800 at Hinton?

A. Yes; roughly.

XQ. How did you get that figure?

A. By making a study of the rate of reduction of waves in the 1930 series tests, various waves, and also the rate of reduction of waves in my model test.

XQ. You can't give us any idea—I am very much of a novice on this and can't follow you—you can't give us any way you integrated these figures and had them separated and then embodied them together?

A. I obtained the result by studying the various waves of the 1930 series, whether they were adjacent to waves of similar size or separate, whether at high stage or low, and whether they were of large amplitude or small amplitude at the start, and by considering the results I got from my model.

~~XQ. Aren't the~~ waves in the 1930 series totally dissimilar?

A. I would not say that.

XQ. What was the volume of this wave at Kanawha Falls, of your #594?

A. I don't have that figure in mind.

XQ. Will you give us that? [Witness made calculation.]

A. According to my figures, in a general way the volume of the wave at Kanawaha Falls would be in the neighborhood of 1,400 second-feet days. I do not consider that a close mathematical computation, but a general figure of about the volume of the wave.

XQ. That is approximately the volume?

A. Approximately.

XQ. Now let's take this other wave, the rectangular wave, that was for 9,000 second-feet and eight hours per day, was it not?

2460 A. Yes, sir.

XQ. The length of that wave would be approximately the same as the other one, fifty miles?

A. Well, not at the start.

XQ. At the start it wouldn't?

A. No, it would be eight hours length, at three miles an hour would be twenty-four miles at the start.

XQ. That would gradually expand until it got to be the same as the other covering a distance of about fifty miles?

A. Yes, sir.

XQ. What was the volume of that at Radford?

A. That was 3,000 second foot days at Radford.

XQ. And what at Glen Lyn?

A. I can only answer that in an approximate way. My opinion is it would be about 2,300 second foot days at Glen Lyn and about 2,100—you didn't ask that.

XQ. What would it be at Kanawha Falls; excuse me, I should have said Hinton?

A. Hinton, in my opinion, approximately 2,100. I started to answer that.

XQ. Have you figured it for Kanawha Falls?

A. In a general way. I should say the volume at Kanawa Falls would be about 1,700 second foot days. Again I will say that is not a precise mathematical calculation, but result based on a study of various things.

XQ. And that includes a study of the 1930 waves as a background?

A. Yes, sir.

XQ. And your test you made in your Laboratory?

A. Yes, sir.

2461 XQ. Anything else now?

A. No. Those are the principal things.

XQ. Now will you turn to Plaintiff's Exhibit #227 please. Do you have it before you?

A. Yes, sir.

X Q. You have studied that also, have you not?

A. Yes, sir.

X Q. Have you looked at wave #4?

A. Yes.

X Q. Take it at Radford, what was the volume of that wave at Radford?

A. This chart doesn't give the volume of it.

X Q. Can't you figure it yourself?

A. Not easily, no, it is quite an undertaking to figure the volume.

X Q. You had to do that, didn't you, to make your calculations with respect to the wave moving down the river?

A. I didn't figure volume.

X Q. Didn't you figure volume at all?

A. I figured volume at various times in the study, but not for the purpose of adjusting the model.

X Q. Isn't volume the most important factor when it comes to the question of effect on the river down below?

A. Yes, sir.

X Q. Did you figure volume?

A. Yes, sir.

By Mr. **Thompson**:

Q. What did you figure the volume to be, if you did figure it, of wave 4, at Radford?

A. 1,620 second foot days.

2462 Q. What did you estimate the height of that wave to be at Radford?

A. By height I assume you mean amplitude?

Q. Yes, amplitude?

A. 4,940 second feet.

Q. And on that map it would be about two feet high, would it not, that is, on Exhibit 227?

A. Yes, about two feet.

Q. 1,620 was the figure you gave in second foot days?

A. Yes, sir.

Q. Don't you think that is a little strong and should that not be about 1,500?

A. No, according to my figures Wave four, at Radford, has a volume approximately of 1,620 second foot days.

Q. Do you recall which diagram or chart you figured that from?

A. I do not remember the number of the exhibit, but I can show it to you.

Q. If you can give us that, I would like for you to do so?

A. It is Exhibit 138.

Q. Now we will go to Hinton and take Wave #4 on Plaintiff's Exhibit 227, and will ask you to figure the volume or amplitude and height in second feet, at that point?

A. Wave #4 towards Hinton I get the amplitude, 3,620 second feet, and volume of 1,720 second foot days.

Q. And can you give us the height in second feet?

A. The height in second feet was 3,620.

By Mr. JACKSON:

Q. That is the amplitude?

A. When you said height, Mr. Thompson, you referred to amplitude, I believe?

2463 By Mr. THOMPSON:

Q. Yes. Now we will move on down to Lock #2, and what is the volume there?

A. According to my figure the volume there is 1,400 second foot days.

Q. Will you give us the amplitude?

A. According to my figures, the amplitude is 2,600 second feet.

Q. Now while we are on Plaintiff's Exhibit 227, will you look at Wave #10, and having reference to the wave at Radford, please give us the volume of the wave at Radford and the amplitude?

A. I will have to look at the diagram for No. 10.

Q. All right, please do so.

A. I get amplitude 6,760 second feet and volume of 2,020 second foot days.

Q. What do you make it at Hinton for volume and amplitude?

A. At Hinton I make volume 1,630 second foot days and amplitude 3,990 second feet.

Q. What did you make it at Lock 2, the volume?

A. At Lock 2 I make the volume 1,350 second foot days and the amplitude 2,880 cubic feet per second.

Q. Will you please recheck the volume of the wave at Radford?

A. You mean #10?

Q. Yes.

A. The volume of Wave #10 at Radford is 2,020 second foot days. That consists of two parts, a small projection on the front of wave of 365 second foot days, and a larger part, 1,665 second foot days.

Q. Still looking at plaintiff's exhibit 227, and at Radford, you see where the black line comes down through there on the wave.

2464 Are you referring in your figures to the preceding small wave just above the words "Radford, Virginia," or to the following wave just to the right?

A. No; the one which is just to the left.

Q. That would be on noon of the 21st?

A. Yes, sir.

Q. Do you, in your reading, of this, consider that that preceding part, that small wave just above Radford, is a part of the wave?

A. I consider that a part of Wave #10 because it is included in Wave #10 at Hinton and just below. Wave #10 overruns it and combines with it.

Q. Looking down below then at Hinton where the black line goes through the wave and up there at 22, would you say that little line as it rises or slopes up there, that that represents the effect or condition of the small wave referred to just above Radford, when it reaches Hinton. Do I make myself clear?

A. Yes; and I will answer the question "yes."

Q. That is the line from 10 a. m. to about 3 p. m.?

A. Yes, sir.

Q. And looking down there on the 23rd at Lock #2, the same effect is shown there where the line comes through from noon to 5 p. m.?

A. At Lock #2 there seems to be only a single wave, and there is no evidence of a smaller wave.

Q. It is the horizontal line from noon to 5 p. m. practically, isn't it?

A. I do not get that; it does not seem to me that way.

Q. Between 9 and 10, and between the line which separates 22 and 23, taking that point where the wave crosses that line and then looking back at the black line, wouldn't you call that practically a horizontal line?

2465 A. Yes; however, I do not think that horizontal part represents the small wave.

Q. Looking down at Lock #2 wouldn't you say that Wave #10 starts to rise at 5 a. m. on the 23rd.

A. About that; yes, sir.

Q. Would you not say that the small wave at Radford that we were referring to, just above the word "Radford" and at the Radford station, is indicated or shown when it gets down to Lock #2, in that short line, from midnight to 5 a. m. Do you get what I am referring to there?

A. I think I get it, but I don't know that I can answer that question definitely. The small wave seems to be obliterated at that point.

Q. The wave is blotted out but the effect of the wave is there, isn't it, in that horizontal line, isn't it indicated there?

A. I don't know that I can answer that question.

Q. If you were following the trend of the lines from Hinton to Lock #2 that would be indicative that that is this wave we have been referring to, this small wave at Radford, and then still smaller at Hinton?

A. Yes.

Q. What is the volume of the wave at Radford excluding the small wave we have been referring to?

A. According to my figures, it is 1,655 second foot days.

Q. What would it be at Hinton?

A. I have not separated the two at Hinton?

Q. What time did you start and finish your wave #10 at Hinton?

A. I started approximately 8 a. m. on the 22nd and terminated approximately 11 a. m. on the 23rd.

2466 Q. Now going to Lock #2, on No. 10, what is the beginning and ending period for that wave?

A. The beginning is approximately at midnight between the 22nd and 23rd and ends about 9 a. m. on the 24th.

Q. Now taking the figures which you have given us at Radford and this Lock #2, and the ratio of the amplitude of Wave #4, is not the persistence there of that wave 53 percent in amplitude and the volume 87 percent?

A. If you will read me the figures you used in that, it will save a good deal of time in checking.

Q. 87 percent in volume?

A. I mean the actual figures?

Q. 1,620 second foot days at Radford, and 1,400 second foot days at Lock #2.

A. That was Wave #4?

Q. Yes.

A. How about Wave #10?

Q. It was 1,655 second foot days and then 1,350 second foot days.

By Mr. Thompson:

Q. Taking Wave #10 proper at Radford, and excluding the small wave, I am asking you to make your computation on that basis, and I am asking you to exclude that small wave and make your calculation, excluding it I understand it is 1,655 second foot days?

A. Yes.

Q. Excluding the small supplementary wave between waves 9 and 10?

A. I have no way of excluding it all the way because I have not considered it at Lock #2.

Q. You have not answered my question, have you?

A. What was the question now.

Q. Could you give us the persistence in volume of waves #4 and #10 from Radford to Lock #2, expressed in percentage?

Q. All right, give it for #4 first?

2467 A. Approximately 86 percent.

Q. Now Wave #10?

A. About 65 percent.

By Mr. Jackson:

Q. Is that excluding the little wave at Radford?

A. No, that includes the little wave at both points.

By Mr. Thompson:

Q. Will you give it to us excluding it?

A. I have no way of excluding it at the lower station.

Q. If you follow the trend of lines of waves 9, 10 and 11, does not the small wave between 9 and 10 at Radford, fall into the horizontal line, midnight to five a. m., at Lock #2, separating waves 9 and 10 at Lock #2?

A. It does not seem to me that is the case. It seems to me that Wave #10 has overrun the small wave and that the small wave is included in Wave #10 at Lock #2.

Q. What is the explanation then for that horizontal line when the wave is at Lock #2 at midnight to five a. m.?

A. I don't know that there is any explanation of it.

Q. Would not your knowledge and experience of wave study tell you?

A. It seems to me when the crest was at the trough between Waves 9 and 10, it became somewhat rounded, but I would not say that the small wave is confined to the rounded part of the trough, or mainly in that trough.

A. Looking at the same wave on Exhibit 145, it is plain on that exhibit that the smaller wave has been combined with the larger wave at that point?

Q. Can you explain from this record, or this chart, or say that the small wave, call it 9½, has disappeared in Wave #10 below at Lock #2?

2468 A. It seems definitely at Lock #2, that the smaller wave forms a part of the main Wave #10. There is quite a dividing line between 9 and 10 at the left of the smaller wave.

Q. Referring to Government's Exhibit 141, look at five A. M. on the 23rd.

A. Is this the exhibit [indicating]?

Q. Professor, following wave No. 10 at Lock 2, will you agree that after five A. M. on March 23rd, this same waven No. 10 at Lock No. 2—is wave 10 at Radford the same wave 10 at Lock No. 2?

A. No, sir, that does not seem to me to be the case.

Q. Why not?

A. I don't know of any simple way of separating the small wave from the larger wave at Lock 2.

Q. How do you explain the horizontal line?

A. That is related in some way to the smaller wave, but I would not say that the volume under that line would represent the volume which could be attributed to the smaller wave at Lock 2.

Q. Professor Thomas, what was the persistence in amplitude of wave No. 4 between Radford and Lock No. 2.

A. You mean expressed—in what way do you mean?

Q. In percentage?

A. In percentage—assuming the figures you read to me are the ones that I testified to?

Q. Yes, sir.

A. It would be about eighty-six percent.

By Mr. Jackson:

Q. That is in volume?

A. Yes, sir.

By Mr. Jackson. I thought the question was changed. You have given that. You have not given him the figures, Mr. Thompson. You will have to give them to him.

By Mr. Thompson. They are 4,940 and 2,600.

By Mr. Jackson. For what?

By Mr. Thompson. Radford is 4,940 c. f. s.

By Mr. Jackson. I have 4,950; no, 4,940 is correct. What is the others?

By Mr. Thompson. Lock 2 is 2,600.

Q. What was it in percentage?

A. For a wave?

Q. The amplitude of No. 4?

A. The amplitude of No. 4 at Lock No. 2?

Q. Lock No. 2?

2469 A. Lock No. 2, the figure I testified to was 1,400.

Q. That was the volume figure?

A. Oh, you want the amplitude?

Q. Yes—4,940 and 2,600.

A. About fifty-two and a half percent, assuming the figures you gave me are correct.

Q. On your Exhibit 594, you gave figures showing an amplitude of 39 percent persistency, didn't you?

A. I do not have that data at hand, but what is that exhibit?

Q. That was Exhibit 594.

A. Yes, sir; that was Exhibit 594.

A. I cannot find my memorandum as to what I testified as the amplitude at Kanawha Falls.

Q. Can you get those figures?

A. I can get the volume.

By Mr. **Jackson**:

Q. Can you look at the two figures that Mr. Thompson wants to compare?

A. I think the one he wants is 9,000 second feet.

By Mr. **Thompson**:

Q. With respect to the rectangular wave that you described, you have 9,000 at Radford and 4,000——

A. (Interrupting.) Yes, sir.

Q. (Continuing.) At Kanawha Falls.

A. Yes, sir.

Q. Which would make a persistency of 45 percent?

A. Approximately 45 percent.

By Mr. **Jackson**:

Q. Forty-nine percent?

A. Forty-five percent.

By Mr. **Thompson**:

Q. So that your test waves or your waves that you have testified about rather, did not have the same persistency that wave 4 had on the test in 1930?

2470 A. No, sir.

Q. Professor Thomas, in order to create an oscillation, would you not discharge a large volume of water in the Marmet pool and suddenly cut it off, to make an oscillation in the Marmet pool?

A. Would such an oscillation be caused in that way?

Q. Yes, sir.

A. Yes, sir; that would be a way to cause such an oscillation.

Q. You testified yesterday that you created a wave fifty-percent greater and similar in shape to the 1930 tests of wave No. 2 at the London Dam; that you ran this wave through the Marmet pool, maintaining as nearly a constant level as possible in the Marmet pool. Is that correct?

A. Yes, sir.

Q. Did you observe any oscillation in the Marmet pool?

A. Yes, sir, there were oscillations.

Q. Isn't it a fact that the conditions you laid down here would prevent an oscillation—in other words, if you allowed practically the same amount of water to come into the pool that was going out, wouldn't you prevent an oscillation?

A. No, sir, you could have an oscillation with no flow at all through the pool.

Q. How would you create the oscillation?

A. Going back to the old illustration, just as you would create an oscillation in a plate of soup; you could have it without any flow through it.

Q. Yes, sir; but if you have a pool kept at a certain level and have the same amount of water coming in there and going out, how could you create an oscillation?

A. By suddenly increasing the inflow or decreasing it—a decrease in outflow or inflow.

Q. Would you call that an oscillation?

2471 A. I don't think the question clear—call what?

Q. An action of that kind in the Marmet pool.

A. I should say that such an oscillation was created—if it was created in that way, you would call it an oscillation.

By Mr. **Thompson**:

Q. Is that what you call an oscillation when you use the word seiche?

A. Yes, sir; by seiche, I mean a condition in which the water at one end of the reservoir, or both ends of the reservoir, oscillate up and down.

Q. Do you understand that water, under conditions of that kind, goes over the top of the—let us say the Marmet Dam.

A. It might or might not, depending on the height of the oscillation and the height of the water with respect to the top of the dam before the oscillation started.

Q. What is the normal pool level of Marmet with respect to the height of the dam?

A. I don't know—you mean with respect to the crest of the dam?

Q. Yes.

A. As I understand it, about 0.3 of a foot is allowed for variations; the pool level is supposed to be kept within 0.3 of a foot of the top of the dam.

Q. And it is supposed to be kept constant.

A. As nearly as practical.

Q. How is it possible to have any oscillation, if you have the same amount of water going in and the same amount going out?

A. Because an oscillation does not depend on the inflow or outflow; it simply depends on the travelling of the waves up and down the pool.

Q. Didn't you say yesterday that an oscillation is created by sudden inflow?

A. A sudden change of inflow or outflow.

Q. Would you change the level of your pool if you let the same amount of water go out that was coming in?

2472 A. I cannot answer that in a short way. Assuming that both stations are operated and the pool levels are constant and both shut down at the same instant, you then would produce a condition that would create an oscillation—the flow at both stations would be the same, but yet an oscillation would be produced.

Q. When you made the tests at Marmet, did you do that—close both pools at the same time?

A. No, sir.

Q. I mean stations?

A. No, sir.

Q. You testified on page 5701—strike that out. Assuming a three foot draw down at London pool eliminated, assume London and Marmet and Winfield maintained at fixed pool levels, assume a wave of 4,100 second feet entering London pool, will not this wave pass through London pool into Marmet pool and through Marmet into Winfield and beyond Winfield into the Ohio undiminished in volume and amplitude?

A. I remember such a question. I would like to look at my record [witness examines paper]. Is that the wording of a question asked, or a direct question that you are asking me now?

Q. No, I am asking you now. It is on page 5701 and 5702.

A. I misunderstood you.

By the COURT. Go ahead, if you can answer it.

By the WITNESS. I should say that, if the pool remained at a mathematically constant level, with absolutely no variations, the waves would pass through undiminished, but with ordinary routine variations, the waves would be completely absorbed and obliterated by the operation of the power plants. The Court called attention to that yesterday afternoon, and I called attention to the fact in my testimony that two inches of variation in the level of Winfield and Marmet would be sufficient to completely re-regulate those waves, and in the case of the Gallipolis pool, a variation of three-fourths of an inch would be enough to completely re-regulate it; and in the case of the Marmet pool, I know that variations of 0.3 of a foot are permitted to occur frequently and normally, and I feel justified in assuming that somewhat similiar variations will be permitted in other pools, and so my opinion is that it is utterly improbable that these waves would be transmitted through that series of navigation locks into the Ohio.

Q. If they are transmitted through the power plant, aren't they transmitted?

A. They are completely obliter'ed in transmission through the power plant.

Q. I cannot call that wave "A" or wave "B," but that volume of water goes through the power plant, doesn't it?

A. It will be re-regulated through the power plant; it will pass through there uniformly or intermittently.

Q. If it did not pass through the power plant, what would happen, in Marmet, for example, with this wave?

A. I don't think that is clear.

Q. It seems very simple. You have a wave into Marmet of 4,100 second feet?

2474 A. Yes, sir.

Q. And you say it is re-regulated?

A. Yes, sir.

Q. Suppose that the power plant was shut down, what would happen to that?

A. You would have to open the roller gates to keep them from overflowing.

Q. And it would go through, wouldn't it?

A. Not the original wave; some discharge from the roller gates.

Q. The wave itself would go through, 4,100 second-feet would have to go through there or it would spill over?

A. It would go over or through the gates.

Q. If it didn't go through the gates, it would spill over the top, then?

A. Yes, sir.

Q. If you get a constantly fixed level, you would have to let it go through the gates, wouldn't you?

A. If you kept a mathematical level; if you permit variations of a few inches, then it would not have to go through. Variations of pool level would be sufficient to re-regulate it.

Q. Getting back to my question: if this 4,100 second-feet were coming into the pool, you would have to open the gates to let it through or have it run through the power plant, wouldn't you?

A. As I said, the London pool would completely absorb that wave; it would absorb a wave two or two and a half times as large, and it would not have any effect below London.

Q. Coming back to the London pool and assuming that the London pool has a fixed point at the top, assume that we do not have the three-foot draw-down and water comes into the

2475 London pool, supposing the power plant closed down—what would happen?

A. Either the gates would have to be opened or the water would spill over the top.

Q. The waves would go through, wouldn't they?

A. Greatly reduced in amplitude.

Q. Why would they be greatly reduced in amplitude?

A. Because, to spill over the top of the dam, it would have to build up a head to the top of the dam several inches and that would store the water.

Q. It is considered good practice or practice that is countenanced to let water go over a dam of that kind?

A. No, sir.

Q. What you would do would be to open the gates and let it go through?

A. Yes, sir.

Q. Wouldn't this wave go on down through there that we are speaking about—this 4,100 second-feet?

A. It would cause a rise of a couple of inches in the pools below.

Q. Wouldn't that wave go on through down to the next pool?

A. Yes, sir.

Q. If you did not open the gates and wanted it to go through, they would have to let it go through the power plant, wouldn't they?

A. Yes, sir.

Q. Well, that is not re-regulation, is it?

A. If the water in the pool is permitted to rise as the wave comes into it, that is reregulation.

Q. Do you mean to tell the Court that letting that water go through by way of the dam or the gates, or by way of the power plant, is reregulation? 2476

A. I may say any operation which causes the levels to fluctuate will produce a condition where there will be reregulation and will obliterate the wave.

Q. You can call it any names that you wish, but you have to let the water go through—the 4,100 second-feet or it will go over the top, will it not?

A. It depends on how much of this is drawn down at the beginning.

Q. We are saying that there is a fixed level there and that the pool is filled.

A. Yes, sir, in that case——

Q. (Interrupting.) It has to go over the top?

A. It has to go over the top or through the gates.

Q. Or through the plant?

A. Yes, sir.

Q. And would go that way past each dam?

A. If the pool levels were maintained at a mathematical constant level, it would go through; if the pool levels were not maintained that way, the wave could be reregulated in any possible way—in many ways.

Q. You spoke of some minor fluctuations that you saw when you were making these experiments or studies at Marmet?

A. Yes, sir.

Q. I believe you named the operation of the locks?

A. Yes, sir.

Q. And then the operation of the roller gates?

A. Yes, sir.

Q. And gusts of wind?

A. Yes, sir.

2477 Q. I believe you said that there was one operation of the locks while you were there?

A. Yes, sir, at London.

Q. And there were no other operations of the locks.

A. No, sir; there were other operations that day, but not while I was there. As I recall it, the records showed there were lock operations that day, but not at the particular time while I was there.

Q. So that one operation could not account for an increase in the rise of water in the pools below, could it—that one operation of the locks?

A. Such a rise occurred immediately after the lock operation.

Q. Don't you know, as a matter of fact, that that boat that you speak of was going upstream, rather than down stream, that was being locked?

A. I think it went the other way, if my recollection is correct. I saw it coming out of the lock. However, I can check my records on that. [Witness examines paper.]

A. The lockage that I observed was on August 14th at two o'clock P. M.

By Mr. Thompson:

Q. On August 14th at two o'clock P. M.?

A. I have two records on this and this one [indicating] does not check with my records. I will have to look at the other one.

Q. Do you know what the one that you have there says?

A. The one I have—this record [indicating] does not show a lockage on the 14th. [Witness examines additional papers.] On August 14th, at 2.35 p.m., upstream.

Q. Then there would not be any flow of water down stream in locking upstream?

A. They may have prepared that lock for that boat just before it cam through. I assume that was the cause, but I did not verify that. There was a definite rise in the pencil at that time as I came in and a boat was at the lock. 2478

Q. You have your records there; there was not any other lockages?

A. On that day, one at five P. M. downstream at London and two upstream about eight o'clock P. M.

Q. After the tests were made?

A. That was during the period of the tests.

Q. Did you see that lockage?

A. No, sir; the only one I noticed was at 2.35 P. M.

Q. It was not a gusty or windy day when you were there, was it?

A. No, sir; but in the latter part of the afternoon, it became somewhat windy, and I noticed definitely an increase in the fluctuations in the pencils of the gages, as conditions became slightly windy. There was no strong wind, but a definite breeze came up during the latter part of the afternoon.

Q. There was not much indication of it?

A. No; as soon as the breeze came up, the pencil of the gage began to fluctuate from 0.05 to a 0.10 of a foot.

Q. Were the roller gates up when you were there?

A. The roller gates at Marmet were up three inches for a short period during the test.

Q. That was very small?

A. Yes, sir.

Q. Then it must have been a discharge of the turbines that caused the wave and was not these oscillations you speak of?

A. The minor oscillations you refer to?

Q. No. The minor oscillations were not caused by the
2479 the three conditions I referred to.

A. Yes, sir; these minor oscillations were caused by the three conditions you refer to: Lockages, taking a load off, blocks of load and by wind; and there was a small gate operation, but it did not produce any surge that I could detect.

Q. Can you give us the time when these gates were operated?

A. I don't know that I have a record of that. [Witness examines papers.] It was during the night. I think it is in the record, but I will have to take time to find it.

2480 Q. On what studies or observations do you base your Statement that power tides or waves rise and fall slowly?

A. In this case, I based it on the studies of the 1930 series of waves or tides.

Q. Have you ever studied any other power waves?

A. Not intensely, the way I have these.

Q. So you really do not know their characteristics?

A. Well, my opinion is that general hydraulic knowledge tells you a great deal about the characteristics of such waves in general. They are not greatly different from rain waves.

Q. Well, if your studies were general, your conclusions would be general also, wouldn't they?

A. Well, I don't think so. I think my studies in general give me the training to interpret these specific cases.

Q. What method did you employ in calculating the rate of flow obtaining during your tests at the London and Marmet dams?

A. Multiplied the kilowatts generated at the station by certain factors which were obtained by the test curves for the units.

Q. Do you mean——

A. The turbines and generators.

Q. Are you familiar ~~with what~~ happens to the discharge of a hydro plant when a breakdown occurs on the transmission lines connecting that plant with a system load?

A. Yes.

Q. What happens?

A. The turbine governor will close the gates.

Q. And the load drops very suddenly?

A. Yes. You speak of it as an open circuit?

Q. Yes.

A. Yes.

2481 Q. Supposing that the Radford plant were operating and discharging 9,000 second-feet, and the plant suddenly closed down (that is, the transmission line suddenly closed down), wouldn't there be an immediate cessation of discharge of water also?

A. A very quick cessation, yes.

Q. You were speaking about silt depositing in the pools: Do you know that recent observations at Boulder Dam show that silt in water entering the upper region of the reservoir followed a subsurface channel to the dam and passed through the openings at the dam with little decrease in silt content?

A. I had not heard that.

Q. You had not heard that?

A. No.

By Mr. THOMPSON:

Q. You stated that, in your opinion, the out-flow from the London dam, on June 10, 1936, at 2 A. M., was not 11,000 second-feet, as shown on Government Exhibit 229. In your opinion, how much was the outflow at that time?

A. I have no easy way to determine that exactly.

Q. How did you know that it was not 11,000 second-feet?

A. I think I said it was improbable it was 11,000 second-feet. According to my recollection, I said there was an oscillation in the pool at that time, and the ordinary relation between stage and discharge did not hold.

Q. But that was just simply a surmise of yours. It is not based on actual knowledge, is it?

A. No. The fact that the discharge stage relation did not hold during a period when seiches are occurring is based on actual knowledge, and because of this fact I could not say positively whether or not it was 11,000 feet at that particular instant, but I think it highly improbable that it was.

Q. Didn't you say that that little up-raise there of what looks like a finger standing at the top of the wave, Exhibit 591, was caused by lockage?

2482 A. I think I said in my opinion it was probably caused by lockage.

Q. You are not sure about that?

A. No. I cannot be positive of that, for one thing, because of the uncertainty of time in this record. I think that its relation to other storages caused by lockages are equal. I think that this probably was caused by a lockage.

Q. It might have been caused by some other reason, might it not?

A. Well, it seems to be improbable it was caused by any other reason.

Q. Do you know what the total power generation at the London dam was between 9 and 10 A. M. June 16, 1936?

A. I have the data by which that could be determined.

Q. Can you give us that? Have you got it handy?

A. I have a continuous record of the operation of that plant which, I think, shows that date. Would you like to have it?

Q. If it is not too much trouble, you can get it right now.

A. Between 9 and 10. Do you want the total between those two hours, or the individual hours?

By Mr. Thompson:

Q. The kilowatt hours between 9 and 10?

A. 15,000.

Q. What was the corresponding discharge for the same hour?

A. I can obtain it quite closely by multiplying by .62, if that will be close enough.

Q. All right.

A. About 9,300 second feet.

Q. Is that an average for an hour?

A. That is an average for an hour.

Q. Is it not reasonable that the maximum during that hour might be as much as 11,000 feet, as shown on Exhibit 229?

A. No, it is not.

Q. You do not think that is reasonable?

A. No.

2483 Q. You spoke about the fact that if the roller gates were open it might be a very serious disturbance created down in the London and Marmet dams?

A. Yes.

Q. You think there is any conceivable chance that the roller gates would be operated in that way by the United States Engineers?

A. No, I do not.

Q. Your 1930 test waves had relatively short crests, did they not?

A. Do you mean at the point of beginning, or further down the river?

Q. At Radford?

A. Yes, at Radford.

Q. Would you not expect waves from Radford having a broader crest, as shown in Government Exhibit 225, to be much more persistent?

A. The question is not complete enough to answer it.

By Mr. Thompson:

Q. That is having a broader crest?

A. Having the same volume?

Q. Yes, having a volume shown on Exhibit 225?

A. 226 the exhibit is.

Q. 226; pardon me.

A. I see no reason why they should be more persistent.

Q. A wave with a broader crest, wouldn't that be more persistent?

A. Not necessarily.

Q. Would the fact that the waves started probably 40 miles further-down-stream not make them more effective, or more persistent, when they reached Lock No. 2?

A. I don't think so, assuming the same discharge at the starting point?

Q. So distance does not make any difference; is that the idea?

A. I understood you asked me if they were traveling by the same distance and having the same volume at the start.

2484 Q. No. I did not mean starting the same distance, because I eliminated the 40 miles between Buck and Byllesby and Radford.

A. What is the question?

Q. Don't you think a wave of the same size, starting from Bluestone, for example, and traveling down the Kanawha Falls, would have a greater effectiveness or persistence, if you use that word, than a wave of the same size starting from Radford?

A. I don't see why it should have more persistence. Do you mean the rate of decrease?

Q. Yes. For example, it would not be flattened out as much as if it had traveled a shorter distance?

The COURT. Do you understand the question?

WITNESS. It is not entirely clear exactly what you mean. The rate of decrease, I think, might be the same in both cases.

By the COURT:

Q. Let me ask, supposing a wave of certain dimensions was released up at the Buck Dam, and a wave of the same volume, under the same conditions, was released down at the Radford dam on separate occasions, in order to make a comparison; when it finally got down to Kanawha Falls, wouldn't the wave from Buck dam have been distributed or flattened out more than the other?

A. Yes, indeed.

By Mr. JACKSON:

Q. There was confusion about the rate of decrease?

A. Yes, sir.

By Mr. THOMPSON:

Q. Would not a wave, such as is shown on Government Exhibit 226, starting from Radford, have more persistence on arrival at Lock No. 2, both in amplitude and volume, than a wave of a similar size (than the wave shown on Defendant's Exhibit 594) starting at Radford and going down as far as Lock No. 2?

2485 A. Do you refer to these waves as compared to that one?

Q. Yes.

A. In my opinion the two are essentially similar. There is no outstanding distinction between them. I could not say which would have the greater persistence.

Q. Doesn't the wave on Government Exhibit 226 approach the ideal of persistency more than the wave on Defendant's Exhibit 594—that is as to shape?

A. I do not see any essential difference between those two waves.

Q. Professor, do you know what the drainage area at Radford dam site is?

A. I do not have the exact figure in my mind, but approximately. I can look it up.

Q. Is it not 2,283 square miles?

A. Something on that order. The figure I have is 2,400 square miles.

Q. All right. What is the total drainage area of the Kanawha water shed?

A. At Kanawha Falls?

Q. Yes.

A. You asked the Kanawha water shed.

Q. What is the total drainage area of the Kanawha water shed? Strike out "at the falls."

A. Very nearly zero.

Q. The entire water shed?

A. At Kanawha Falls the water shed above Kanawha Falls, including the New and Gauley Rivers, is 8,375 square miles.

Q. What is the water shed of the entire Kanawha River?

A. The figure I have at Point Pleasant, West Virginia, is 12,245 square miles.

2486 Q. If the records of the United States Geological Survey show the mean flow of the Kanawha River, at Kanawha Falls Gage, to have been 1,130 second feet for the month of October, 1930, and if the testimony given in this case by Mr. C. H. Pierce, Senior Engineer of the Geological Survey, shows the mean flow at the Radford dam site to have been 759 second feet for the same month, would you question those figures as substantially correct?

Mr. JACKSON. I object to that question. There is no testimony of that.

The COURT. He may answer it.

Mr. JACKSON. Exception.

A. I see no reason in the figure itself why it could not be possible. Of course, I have no knowledge as to the actual flows at that time.

By Mr. THOMPSON:

Q. You see no reason to question them, though, do you?

A. I think I can't answer it any more clearly than I did.

Q. On the basis of these figures, is it not true that slightly more than two-thirds of the water that passed Kanawha Falls Gage, during that month, came from above Radford dam site?

A. I should say in the vicinity of two-thirds.

Q. You have read, I believe, Government Exhibit 145, being House Document No. 91, 74th Congress, First Session, have you not? That is known as the 308 report on the Kanawha River.

A. I have not read it thoroughly, but parts of it.

Q. If you were responsible for navigation on the Kanawha River during a period such as 1930 and the London and Marmet dams were in operation, would you be willing to cut off the flow of the watershed from above the Radford dam during a month such as October, 1930?

By Mr. JACKSON. I object to that question, because not proper cross examination; has no relation to the examination in chief; and this witness has not qualified as to navigation.

By the COURT. I don't see the objection from that standpoint, but I think the question has a very incomplete foundation.

By Mr. JACKSON. I should also like to object for the reason it doesn't specify the length of time of cut off.

By the COURT. As I said it has a very incomplete foundation.

By Mr. THOMPSON. I will make it for any length of time at the Radford dam.

By Mr. JACKSON. For a minute or more.

By Mr. THOMPSON. We will not consider a minute. I don't think that is sensible.

By Mr. JACKSON. I object unless something that is sensible is substituted then.

By Mr. THOMPSON. We will make it forty-eight hours then.

By Mr. JACKSON. I still object to the competency of the question.

By the COURT. He may answer.

By Mr. JACKSON. Exception.

2487 A. I think if I had the power to prevent the water from being shut off under those conditions I would exercise it.

Q. Have you hydrograph showing the fluctuations at the upper ends of the pools below the London and Marmet dams during the test of October 14 and 16, 1930?

A. Yes, sir.

Q. Could we have copies of those?

A. Yes, sir.

By Mr. JACKSON. We will supply them.

By Mr. THOMPSON:

Q. May we also have a report of the operation of the power plant when you made your test?

By Mr. JACKSON. You mean the record of the operation?

By Mr. THOMPSON. Yes.

A. I have only a single copy of that.

Q. How soon could we get a copy?

A. I have only one copy.

Q. Could we borrow it this evening?

By the WITNESS. So far as I am concerned.

By Mr. JACKSON. We will try to get you a copy.

2488 Redirect examination by Mr. JACKSON:

Q. Professor Thomas, I think you testified you began your integrating model tests in the latter part of July of this year. Have you since that time refreshed you recollection as to the accuracy of that time?

A. I think it was early in July, in the early part of July.

Q. Do you happen to know whether it was before the opening of this case on July 13th?

A. Yes; it was before July 13th.

Q. Will you explain to the Court the principle of the integrating model?

A. Such a model is a model of some hydraulic structure which does not resemble the structure closely physically, but satisfies the same mathematical equation. I think I can best explain the principle by using the chart. [Witness indicated on chart.]

Line "b" represents the bed of the river; line "s" represents the surface of the water, and we can give consideration to any cross section of the river. At that cross section there is a definite and well-known relation between the velocity of the water, which I will represent by "v"; the hydraulic depth which I will represent by "r" and the elevation above sea level, which I will represent by "z," and the distance measured from any arbitrary starting point to give horizontal distances, which I will designate by "x," and we will consider a slice at right angles to the river
of one-foot thickness. Now the well-recognized and
2489 adequate relation among those things can be expressed
by a formula applied to that slice one-foot thick. Although I realize there are non-technical persons here, I think if I write the formula down it will convey the idea I am talking about. The formula is that the velocity square divided by 2.21 times the hydraulic depth to the 4/3 power, times the roughness factor squared is equal to delta z, which is the rate of rise of the water surface divided by delta and v over g times delta v over delta x, which is the rate of change in the velocity times the velocity, and 1 over g times delta v over delta t. I wrote that formula just to show I am talking about something definite, and not something very general or vague.

Q. Was that a definite mathematical relationship?

A. That is a mathematical relation that takes into consideration the rate of rise of the river surface at that point, which is vital in understanding these waves.

Now in order to solve that for the whole river you have to satisfy that condition for every foot wide you have all the way down the river, which is a tremendous job.

Now if you have a model of that river you could predict the flow through that model by the same equation if you had the problem given you.

Those principles are explained in Durand's book on "Flow in Pipe Lines" and are also explained in Freeman's "Hydraulic Laboratory Practice" and also explained in various other places.

The fact there is this relation between the model and prototype makes it possible to distort the scale of the model and still obtain reliable results from the distorted model.

If the model although distorted had perfect representation of the prototype at every cross section the results of such model
would be perfect. If you cannot build your model abso-
2490 lutely perfect with respect to representation of the cross

section you nevertheless can get satisfactory approximate results depending on how closely and accurately the model is made.

Q. Now will you explain about the gages on the model, are they sensitive or otherwise?

A. In making a small model, the most satisfactory way to measure the variations in depth of the water in the model is to use an inclined gage, simply a glass tube inclined at an angle, and chemically cleaned up, so as to be absolutely clean, and that glass tube multiplies the fluctuations of the water surface, so with a model eight inches deep it is possible to represent the water in a reservoir 125 feet deep and still measure the depths closely enough in the model so as to represent one-half inch or three-fourths of an inch in the prototype.

Q. That is so the gages would reflect any change that would be as small as one-half or three-fourths of an inch in the full sized project?

A. Yes sir, in the full sized project.

Q. In the development of an integrating model, are gaging stations and records essential?

A. Absolutely.

Q. For what reasons?

A. In order to adjust the roughness of the model so as to satisfy the necessary conditions.

Q. Is that adjustment of roughness a matter of trying to reproduce a little Sandstone Falls or to adjust the friction so it will conform to the mathematical or hydraulic laws?

A. The latter is the case.

Q. State whether the principle of solving hydraulic problems by model testing is used in practical work?

2491 A. It is used very extensively in practical work; at the present time the U. S. Government maintains a great Laboratory at Vicksburg, Mississippi, where that work is done on a great scale.

Q. Can you state whether or not the use of model testing as a short cut for complicated mathematics increases with the size and complexity of the project?

A. Yes; on very large projects it is feasible to spend the necessary money to make large and accurate models.

Q. In your cross examination, with reference to the volume of Wave #10 at Kanawha Falls I was not quite clear when the reporter read your answer whether he gave the volume as 3,050 second foot day or 1,350 second foot day. Which is correct?

A. 1,350.

Q. You were asked to give a number of figures for the volume of certain of the waves mentioned or included rather in the 1930 wave tests. Will you state whether the volume of those waves were computed from the Government Exhibit #141, or Government Exhibit # 226 or #227; which one was it?

A. They were made from #141.

Q. The large hydrograph?

A. Yes, sir.

Q. Of individual gaging stations?

A. Yes; of individual gaging stations.

Q. You were also asked on your cross examination about a certain lockage you had observed at Marmet, in the course of these tests, and you spoke of preparing the lock as I understood it; what did you mean by that?

A. In case the boat approached from the downstream side of the lock it would be necessary to empty the lock before the boat could enter.

2492 Q. That would be true if the lock had been filled?

A. Yes; if previously filled.

By Mr. Thompson:

I understood him to say on his cross examination he didn't know if the lock was empty or not.

A. I might have looked in the record to see the previous lockage, whether upstream or downstream. I did not do that when you asked me the question.

By Mr. Thompson:

You don't know now, do you?

A. I can look it up now.

By Mr. Thompson:

Q. But you don't know at this time?

A. I have my notes of the lock master's record but I can't answer that without looking at the notes.

Q. When you said a minor oscillation might be caused by lockage, what is it about the lockage operation to which you refer?

A. It is the emptying of the lock through the conduits of the lock into the pool in which the fluctuation will occur.

Q. What effect, if any, would the filling of the lock at the lower end of the pool have as regards the possibilities of a minor oscillation?

A. The filling of the lock could have an effect also in producing an oscillation.

Q. Have you got at hand the exhibit about the 1930 wave tests?

By the Court. How could that happen? You are transferring a boat from the London pool into the Marmet pool. How could the filling of that lock which must be filled from the London

2493 pool where the water comes into it from the upper pool, how would the mere filling of that lock produce an oscillation in Marmet; it might if the lock were emptied?

By the WITNESS. What I had in mind was the filling of a lock at Marmet.

By the COURT. You are at London dam, passing a boat downstream——

By the WITNESS. That wouldn't have any effect, the filling of the Marmet lock would affect the Marmet pool.

Q. Professor Thomas, your attention was directed to Wave #4, I believe, on those wave tests?

A. Yes, sir.

Q. Will you state whether in your opinion that wave is typical of those wave tests?

A. In my opinion Wave #4 was not altogether typical.

Q. You were asked about the percentage of reduction in volume and amplitude of Wave #4 and Wave #10 of that test?

A. Yes.

Q. Will you state the reduction, percentage of reduction in volume and amplitude of some of the other waves on that chart, if there are any to which you would like to refer?

A. The reduction in volume from the Radford dam site to lock #2 Wave #5, has a reduction to 40%.

Q. Stated the other way is that a reduction of 60%?

A. Yes, a reduction of 60%.

By Mr. JACKSON:

A. In the case of Wave #8 the volume at Lock #2 was 51 percent of the volume at the Radford Dam Site.

2494 In the case of Wave 13A, the volume of the wave at Lock #2 was $16\frac{3}{10}$ percent of the volume at the Radford dam site.

In the case of Wave 13B the volume at Lock #2 was 15 percent of the volume at the Radford Dam site.

In the case of Wave 14A the volume at Lock #2 was 16½ percent of the volume at the Radford dam site.

In the case of Wave 15, the volume at Lock #2 was 47 percent of the volume at the Radford dam site.

In the case of Wave 16, the volume at Lock #2 was 38 percent of the volume at the Radford dam site.

Q. Now will you please give the percentage of reduction in amplitude?

A. In the case of Wave #5 the amplitude at Lock #2 was 45% of the amplitude at the Radford dam site.

The amplitude of Wave 7 was 39½ percent of the amplitude of that wave at the Radford dam site.

In the case of Wave #8 the amplitude at Lock #2 was 40% of the amplitude of that wave at the Radford dam site.

In the case of Wave 13A the amplitude of the wave at Lock #2 was 10½ percent of the amplitude at the Radford dam site.

In the case of wave 13B the amplitude at Lock #2 was 18½ percent of the amplitude at the Radford dam site.

In the case of wave 14A the amplitude at Lock #2 was 13 percent of the amplitude at the Radford dam site.

In the case of Wave 14B the amplitude at Lock #2 was 27 percent of the amplitude at the Radford dam site.

In the case of Wave 16, the amplitude at Lock #2, was 30 percent of its amplitude at the Radford dam site.

Q. In a comparison which you were asked to make between the 1930 waves upstream and those same waves at Kanawha Falls and other points downstream, were those comparisons based upon the wave as it was emitted from the Buck Power Plant or upon waves as they passed the Radford Dam site?

2495 A. They were based on the latter.

Q. You were also asked to make some comparison between the waves of 1930 wave test and the wave of the form and volume disclosed by exhibit 594. Do you recall that?

A. Yes.

Q. Was that comparison based upon the 1930 wave test as they passed the Radford dam site?

A. It was based on a study of those waves.

Q. What I am getting at is, in making the comparison, did you take those 1930 waves in the form they passed the Radford dam site or in the form when they were emitted from the Buck Plant upstream?

A. I took them in the form where they passed the dam site.

Q. What effect, if any, or what difference in the form of these waves, that is, the form of 1930 waves, as they passed the Radford dam site, and the form of the waves conforming to exhibit 594, as it was assumed to be discharged at the Radford power station, what difference in the form would there be in the discharge at the Radford Power Station or what difference would it have upon the percentage or reduction in amplitude or volume in second feet by the time these waves respectively reached Kanawha Falls?

A. The waves corresponding to the exhibit would have a greater reduction at the time they passed Kanawha Falls.

Q. Would the difference in the form of the two waves have something to do with that?

A. Yes, sir.

Q. Explain briefly why that is?

A. The greater length of the wave corresponding to Exhibit 594, that is, the fact that it occupies the greater portion of

2496 the day would tend to fill up the valley between successive waves.

Q. What is the comparison between the duration of the maximum peak of a wave conforming to exhibit 594, and the duration of the peak of the waves of the 1930 wave test as they passed the Radford dam site, that is, which has the greater duration, referring to maximum peak?

A. The maximum peak in Exhibit 594, has a duration of one hour.

Q. How does that compare with the maximum peak of the waves of the 1930 wave test as they passed the Radford dam site?

A. That is less.

Q. Which is less?

A. One hour is less than these other peaks.

Q. You were examined at some length about the percentage of relationship between amplitudes and volumes of waves as they proceeded downstream. Does the mere relation between amplitudes and volumes of waves at the successive points travelled downstream give a true picture of the nature or extent of change in those waves or wave conditions in passing downstream?

A. No, I am of the opinion we cannot solve problems pertaining to wave head reduction or wave amplitude reduction by applying simply percentages based on other waves.

Q. Does the percentage of volume and time enter into that picture?

A. I should say yes.

Q. Can you explain or illustrate your answer more fully with respect to your view that percentage relationship of this character does not give a true picture?

A. I think I can explain that more clearly by making a sketch.

By Mr. Jackson. I would like to have the sketch which the witness made with reference to his explanation of the principle of integrating model marked Defendant's Exhibit 597 before it is removed from the easel.

(Said sketch is here filed, marked Defendant's Exhibit 597.)

By Mr. Jackson:

Q. Now go a head, Prof. Thomas, with your explanation?

2497 A. Sketch "A" represents a series of waves of comparatively small amplitude released at an upstream point such as Radford. For simplicity, I will assume that they are released at a time when the stream bed is practically dry. That is a simplified explanation.

Sketch "C" might represent the conditions when those waves have reached a downstream point such as, for example, Kanawha

Falls. The condition there is caused by overlapping of the crest and tails of the waves, as shown by the dotted line.

A. If there was no flow in the river, the base flows or mean flows would be the same in both cases. I will represent the mean flows by "M."

Now then I will sketch a similar sketch for waves of greater amplitude. These waves again are caused by overlapping the original waves and if there was no flow in the river, the mean flow would be the same, because of overlapping and the filling up of the base. It is readily possible for both amplitudes to be exactly the same at the lower point, although caused by waves of greater amplitude at the upper point, in which case the mean flow would be the same.

In the case of the lower wave, if we assume the original amplitude was 1,000, and the final amplitude was say 500, the percent reduction in amplitude would be 50 percent. Now if we take a higher initial wave and we assume an amplitude of say 3,000, and I am taking that figure simply for illustration, and the same amplitude occurs at the lower station, the percent reduction would be 500 over 3,000 or it would be reduced to 16 percent.

I make this illustration, not to represent any particular case, but just simply to bring out the general proposition that you cannot depend on simple percent reduction as to the case
2498 of two series of waves of unequal amplitude. It is important in this situation to understand that you cannot go on a simple percentage reduction basis. The shape of the wave is more important than amplitude, and it is readily possible that waves of greater amplitude at the upper station will have equal or even less amplitudes at the lower station.

Q. What are those broken lines on that sketch?

A. They represent the tails of the waves as they would be if the waves were individual waves.

Q. That is, the merging of the lower part of the wave?

A. Yes, sir; into a general base flow, the only difference of the two is seen to be in this case that the base flow is higher.

Q. Have you finished your explanation?

A. Yes, sir.

By Mr. **Jackson**:

I will ask that the sketch which has just been prepared by the witness be filed as Defendant's Exhibit 598.

(Said sketch is here filed, marked Defendant's Exhibit 598.)

A. (Continuing.) There is another thing I would like to say——

By Mr. **Jackson**:

Go ahead.

A. In determining the percent of reductions of waves it is important to take into consideration a great many things, among them whether the wave occurs on a rising or falling stage of the stream, whether the wave is one of a series or group of
2499 similar waves or whether adjacent waves are larger or smaller, whether there are minor wave summits between the main wave summit. All of those things enter into the question of what the reduction in amplitude and volume will be, and in the case of the 1930 wave series, we noted that there is an enormous variation in the percent reduction and volume of individual waves, and those percentages depending on a variety of conditions which were present in that series.

Q. Now you were asked to make a percentage comparison in reduction in amplitude and volume between this hypothetical wave emitted at Radford to conform with the Defendant's Exhibit 594, and certain of the 1930 waves as they passed the Radford dam site. Please state whether in your opinion if any percentage comparison were to be made at all, the percentage of comparison between reduction in the wave corresponding to Exhibit 594, in the matter of amplitude and volume, and any of the waves of the 1930 wave test, after reaching some point downstream such as Kanawha Falls should be made with those 1930 waves as they pass the Radford dam site or as they were emitted from the Buck Power Station.

A. It would be more proper to make a comparison with those waves as they were emitted from the power station.

Q. Please explain why?

A. Because as emitted from the power station they would more closely resemble the shape of the actual wave which would be emitted from the power station, and would not have the sharp triangular peak that they had attained when they reached Radford.

Q. Can you select some downstream gauging station which would be appropriate for such comparisons?

2500 A. In making such comparison I would say that the travel of the 1930 waves from Ivanhoe to Hinton could be compared approximately with the travel of the future Radford wave, from Radford to Kanawha Falls.

Q. Which would have the longer travel?

A. The latter, or from Radford to Kanawha Falls is 156 miles, while the distance from Ivanhoe to Hinton is 130 miles.

Q. What effect, is any, would that form of comparison have upon the answers which you gave on cross-examination where you used the Radford dam site as the point from which to measure reduction in the 1930 waves?

2501 A. The reductions in the waves from Radford to Kanawha Falls would be somewhat greater than from Ivanhoe to Hinton, because the distance is slightly longer.

Q. Can you give percentages in reduction of amplitude and volume from Ivanhoe to Hinton?

A. Yes, on some of these waves the reduction in volume, or the volume at Hinton expressed as percentage to the volume at Ivanhoe for Wave #5 is 48 percent, for Wave 8, it is 49½ percent, for wave 13A, it is 34 percent. For wave 13B it is 38 percent. For Wave 14A it is 33 percent.

Q. Are those all in volume?

A. Those were volumes.

The amplitude for wave 5, is 41½ percent, for wave 7, it is 44½ percent; for wave 10, it is 37½ percent; for wave 12 it is 48 percent; for wave 13A it is 10 percent; for wave 13B it is 11 percent; for wave 14A it is 10 percent. For wave 14B it is 34½ percent. For wave 15 it is 23½ percent. For wave 16 it is 14 percent.

Q. Will you give the reduction in amplitude for Wave #8?

A. For wave #8, it is 45 percent.

Q. Are these reductions or percents that you have given, are they the percentage in the original volume that remained at that point?

A. No, sir, they are the ratio of the final to the original.

Q. Will you look at wave 4 about which you were cross-examined, and tell me what was the duration of that wave at Lock #2, how many hours?

A. At Lock #2, the duration was very close to 24 hours.

Q. Please look at Exhibit 141 where the scale is larger?

A. No, I am looking at Wave #2.

Q. Please look at Exhibit 141 and give me the duration for wave 4 at Lock #2?

A. About 28 hours.

2502 Q. Was that Wave #4 followed by an overlapping wave?

A. Wave No. 5 followed it.

Q. Was that Wave #5 overlapping Wave #4 in the same sense as waves in the series you considered would form, conforming with Defendant's Exhibit 594?

A. Possibly, I should say they do not overlap so much.

Q. What I am getting at is the matter of comparison.

Were you comparing there for instance a 28-hour wave with a 24-hour wave, or were you asked to do that?

A. Yes, wave #4 is a 28-hour wave, which would necessarily have more volume than a 24-hour wave.

Q. And would it have any effect on percentage reduction?

A. It would give some reduction in volume, of course.

Q. That is, for wave #4?

A. Wave #4, I do not consider it a typical wave, it occurs on a descending stage and it is spread out in width.

Q. You were asked this morning to express an opinion with reference to the persistency in volume of waves of the form shown on defendant's Exhibit 594, and of certain waves corresponding to the characteristics shown on Plaintiff's Exhibit 226, do you have that?

A. I do not have it here.

Q. In making your answer did you assume, or did you not, that the volume of the wave in each instance would be the same?

A. I had in mind that they would be the same.

Q. On your cross-examination you were asked with reference to the matter of any flow over the crest of dam on any of the navigation pools on the Kanawha. Please state whether flows over dams at navigation pools of that character do occur?

A. Yes, sir; they do occur, quite frequently.

Q. You were also asked questions with reference to the level of pools such as navigation pools on the Kanawha. Will you please state whether those pool levels are or are not subject to minor fluctuations?

2503 A. Yes, the pools are subject to minor fluctuation.

Q. Does that answer apply to present conditions of operation on the Kanawha?

A. Yes, sir.

Q. Under present conditions of operation, are these minor fluctuations both above and below normal pool level?

A. Yes, that means occasionally the water slops over or even frequently slops over the gates.

Q. Prof. Thomas, in your testimony with reference to the reduction of these waves passing down the river, did you give any consideration to such re-regulation, if any, as might occur in the Hawks Nest Pool?

A. No, I did not.

Q. In the course of your cross-examination with reference to the wave corresponding to defendant's Exhibit 594, treating that form as a daily series of waves, you were asked about the duration of one of those waves at Glen Lyn. Will you please state whether the duration of one of these waves at Glen Lyn would be equal to, greater or less than 24 hours?

A. I should say they probably would be equal to 24 hours, the tail of the wave would extend through a 24 hour period, by the time the wave reached Glen Lyn.

Q. Would there by any overlapping by the time it reached Glen Lyn?

A. There would probably be some.

Q. Would there be any overlapping at Hinton?

A. Yes, sir.

Q. Have you any opinion as to what the duration of overlapping would be at Hinton, and I mean just a single wave, the duration of one wave without giving any consideration to overlapping at Hinton, that is, would it be substantially more than 24 hours, or not?

A. You mean a single wave, not a series of waves, but one wave released by itself, with no wave preceding or following?

2504 Q. Yes.

A. Such a wave would have a duration of several days by the time it reached Hinton.

By Mr. Jackson. Now, I would like to offer in evidence the two charts, marked "Defendant's Exhibits 597 and 598."

(Said charts are here filed, marked "Defendant's Exhibits 597 and 598.")

Re-cross examination by Mr. Thompson:

Q. Prof. Thomas, I only have a question or two to ask you. So far as you know, these waves 4 and 10 have never been criticised as not typical of the waves of the test made in 1930. Is that correct?

A. Nobody has criticised them to me.

Q. You never heard any objection to them?

A. I do not think I have discussed these waves, certainly with no one except a representative of the Power Company.

Q. Is it not a fact that on redirect examination you selected a number of very small waves which are not typical because of the various obscure facts as shown by the chart, and which have not previously been considered seriously?

A. I selected waves showing considerable reduction in volume, and I consider those waves should have just as much weight in making the decision as to the probable reduction as some of the larger waves. Because a wave is small is no sign its behaviour should not be given weight in making a study of wave reduction. I think some of the larger waves have more serious distortion in them than some of these small ones. I selected those particularly to bring out the fact that simple percent relations cannot be applied in predicting lowering of waves. The problem is intricate and one requiring many things to be taken into consideration.

Q. Isn't it a fact that the smaller waves you have selected and testified to on your re-direct examination from Plaintiff's Exhibit 227, show less persistence and greater reduction than waves, 2, 4 and 10, from Radford to Lock #2?

A. Yes.

2505 Q. On this basis, would not the two Radford waves, coming from the Radford Project, and being larger, show a greater persistence than test waves, 2, 4, and 10?

A. No, I don't think that is probable.

Q. On the basis of ratio between these two groups, isn't that probable? I mean the Radford wave and the ratio between these smaller waves and larger waves, on your test waves of 1930?

A. As I explained in drawing this chart, I do not think you can discuss this question of reduction simply in terms of the size of waves; the shape is also important.

Q. It is a fact, is it not, that the larger waves on this 1930 test show a greater percent of persistency than the smaller waves?

A. I think in general that is so.

2506 **DANIEL W. MEAD**

Direct examination by Mr. JACKSON:

Q. State your full name and residence, for the record, Doctor?

A. Daniel W. Mead, Madison, Wisconsin.

Q. What is your occupation?

A. Engineer—Civil Engineer.

Q. What is your education?

A. A general common school education and a technical University education in civil engineering.

Q. Did you take a degree?

A. Yes, from Cornell University.

Q. When was that?

A. In June 1884.

Q. What was that degree?

A. Bachelor of Civil Engineering.

Q. Will you just state generally, Dr. Mead, what has been your experience, and then, after you have made the general statement, I will ask you to give some particular details.

A. Well, in general I might say that, after I left high school, I entered the machine shops and spent two years learning the machine trade and got some knowledge of machinery, and then I entered college and took the course in Civil Engineering at Cornell University and graduated in June, 1884; and I was for a very short time with the United States Geological Survey in Wisconsin; then City Engineer at Rockford, Illinois, and then went into contracting, and for the next twelve years, I was engaged most largely in contracting, though I did some work in engineering designing at that time.

Q. Where were your headquarters?

A. In Rockford, Illinois. I left contracting and established an office in Chicago, as Consulting Engineer.

By Mr. **Thompson**:

Q. When?

A. About the latter part, I should say of 1899. I was in
2507 Chicago until 1904, and was asked to take a chair which was to be established, if I accepted it, in Hydraulic and Sanitary Engineering at the University of Wisconsin, the arrangement being that I should continue my practice and spend about half of my time during the college year in educational work, and half as I saw fit, in professional work. I served in that capacity as head of the Department of Hydraulic and Sanitary Engineering for 28 years, and resigned in 1932, but have continued lecturing on Contracts, Specifications and Engineering Relations, in one semester each year since I resigned. I have the position, if it can be called a position, of Professor Emeritus of Hydraulic and Sanitary Engineering.

By Mr. **Jackson**:

Q. Doctor Mead, I have asked you to prepare a statement, not of all your professional activities, but of those along certain lines, and from that will you read into the record a partial list of the hydro-electrical projects that you have examined and reported on.

By Mr. **Thompson**. Can we have a copy?

By Mr. **Jackson**. I haven't a copy—an extra copy now. We will give you one later.

A. The first plants mentioned here are those that I examined and made reports on, but not including construction. The next list is composed of plants I designed and constructed.

Q. Read that?

A. Yes. I want to say that reports were also made on the plants constructed but that I have not mentioned them.

The reports covered the Ox-Bow project, between Idaho and Oregon on the Snake River.

The Ocmulgee project, below Atlanta, Georgia.

The Big Sandy and Cheat River projects, of which there was a number—I don't know how many—in West Virgiina.

The Bull River project in British Columbia.

The Cornell and Knowlton projects and the Bad River project in Wisconsin.

The Manistee River Project at Lansing, and the Pere Marquette project in Michigan.

The Columbia River and Priest Rapids project in Washington.

The Spokane River project in Washington. I might say that I have reported on three or four plants on the Spokane River in Washington.

The Missouri River project in the State of South Dakota.

And there are various others that I cannot recall in detail. The following were designed and built. Shall I give the capacities?

By Mr. JACKSON:

Q. Yes, sir.

A. The next, I think, was the Prairie du Sac—it was 30,000 Kilowatts, on the Wisconsin River. These are not given in the order in which they were built.

The Kilbourn project in Wisconsin, on the Wisconsin River, 6500 Kilowatts. That was one of the early hydro-electric plants, built probably nearly 30 years ago. I think it was just 30 years ago.

High Falls on the Peshtigo River, 7500 Kilowatts.

Twin Falls, between Wisconsin and Michigan. That was 5,000 Kilowatts.

Johnson Falls, Wisconsin, 4,000 Kilowatts.

Brule River, between Wisconsin and Michigan; that was 5,000 Kilowatts.

Pine River, in Wisconsin, 4,000 Kilowatts.

Caldron Falls, on the Peshtigo River, Wisconsin, 7500 Kilowatts.

Sandstone Rapids, on the Peshtigo River, Wisconsin, 4,000 Kilowatts.

Alpena, Michigan; a small plant of 1200 Kilowatts.

Sturgeon River, Michigan, which was a small plant on a small stream—an automatic plant—1,000 Kilowatts.

And I have listed here Rockford, Illinois. I was City Engineer—but this was not for the City, but the Water Power Company there, which built their own plant, an early plant, and the system is the Rockford General Electric or the Rockford Edison Company, I believe, it was called.

Sterling, Illinois, was another old fashioned vertical turbine plant.

By Mr. JACKSON:

Q. Were any of these hydro-electrical plants, reservoir plants?

A. They were all reservoir plants, to an extent. Four I mentioned were built, one above the other on the Peshtigo River. The highest up was Caldron Falls; the next was High Falls, and Johnson—Falls and the Sandstone Rapids, and then two were built—rebuilt lower down stream near Potato Rapids, and one near the mouth of the Peshtigo River.

I reconstructed various plants mentioned here—at Hatfield, on the Black River; Black River Falls and Peshtigo, Wisconsin; Ingalls, Michigan; and one on the Elwha River of the Olympic peninsula in Washington.

By Mr. JACKSON:

Q. State a little what subjects you lectured on, more in detail, in the University of Wisconsin?

A. My lectures were largely on what we call professional subjects; that is, the application of professional knowledge to the construction of various kinds of work. Among those were Water Power; Public Water Supply; Irrigation; Drainage; Hydraulic Machinery; Hydrology; Hydraulic Design; Contracts; Specifications and Engineering Relations.

Hydrology was a subject I introduced. I don't think it was ever taught before, but I insisted upon introducing it at the University of Wisconsin. It is now, I think, quite generally taught in all of the Universities.

By Mr. JACKSON:

Q. Have you had any experience in connection with the design and construction of dams?

A. Yes.

Q. Give a few instances of that?

A. Well, it is hard to remember back 52 years. I have noted them here [indicating papers]. As I recall them, I have noted them.

I mention here, among others, the Danville, Illinois, plant; the Batavia, Illinois, project; and Rockford, Illinois; High Falls; also Kilbourn—it is written here as Hilbourn, but that is a mistake—the "H" should be a "K." Prairie du Sac, Wisconsin. Iron Mountain and Alpena, Michigan; and on the Elwha River, in the State of Washington. There I put a foundation under a dam 100 feet high. The river ran under it and I had to seal the bottom and also reconstruct the plant.

Well, that was continued between 1904 to 1912. There are others mentioned later on. I think this is more or less of a——

By Mr. JACKSON:

Q. A chronological statement?

A. Yes, sir.

Q. Did you have any or have you had any experience in connection with flood control?

A. Yes, sir. I was Consulting Engineer throughout the construction of the Miami Conservancy District work and was acting

Chief Engineer for the first six months and organized the work and got it under way.

I made plans in Oklahoma City for flood protection of the City. Then on occasions, I was at Waterloo, Iowa, advising them as to the protection of their City from excessive floods.

By Mr. Jackson:

Q. Now, Doctor Mead, I want to ask you to select some limited instances of your experience having some relation to the testimony and you have prepared this sheet. [Indicating.] I suggest it would be perhaps simpler if you read into the record such of these experiences as you have noted, beginning at the bottom of page 2, with the 1914 reference?

A. In 1914, I was a member of the Engineering Board for Flood control on the Huai River, in China, for the American Red Cross and the Chinese Republic. This work involved an expenditure of $43,000,000, but the World War broke out in Europe and it was not done.

In 1915, I was Consulting Engineer for the Miami Conservancy District, and Acting Chief Engineer for six months, during the sickness of the Chief Engineer. The total expenditure was $30,000,000; slightly above that, I believe.

In 1917, I reported on the dam and power plant in Austin, Texas, for the City of Austin; the Calaveras Spillway, San Francisco, California. I also reported to the Chief of Engineers of the United States on the foundations of the Muscle Shoals dam, called the Wilson dam.

In 1918 and 1919, I was consulting Engineer for the Peninsular Power Company, for the design and construction of hydro-electric plant on the Brule River, near Florence, Wisconsin.

For the City of Black River Falls, Wisconsin, on re-construction and design of hydroelectric plant.

In 1920 and 1921, I was consulting engineer for the Wisconsin Public Utility Company, Milwaukee, Wisconsin; the Wisconsin Railway, Light and Power Company, of Milwaukee, Wisconsin; the Wisconsin Securities Company, Milwaukee, Wisconsin; the Peninsular Power Company, Madison, Wisconsin, in the building of a hydroelectric plant that year, started on the Pine River South of Florence, Wisconsin.

Also consulting Engineer for the Public Service Company of Northern, Illinois, water power work.

For the Oconto Service Company, Peshtigo, Wisconsin, water power.

The State of South Dakota—reported on the feasibility of the development of hydroelectric power from the Missouri River. Reports published in April, 1920.

Also consulting engineer for the Northern Peshtigo Pulp and Paper Company for a hydroelectric plant at Caldron Falls, Wisconsin—although this company did not build the plant which was finally built by another company.

In 1922, the design and construction of a hydro-electric plant on the Peshtigo River at Johnson Falls.

In 1922, continuing with water power, with the Oconto Service Company, Peshtigo, Wisconsin, began the design and supervision of power station for the Madison Gas and Electric Company of Madison, Wisconsin, and put in several units, I think 5, 10 or 15 thousand Kilowatts, as I remember, turbo generating plants for that company at Madison.

By Mr. JACKSON:

Q. I suggest that you turn to page 5 of the statement, and just simply state some of your more recent experiences, beginning with 1926 or 1927; whatever it is?

A. Do you want all of this stuff read [indicating paper]?

Q. Those that deal with your most recent experiences?

A. Well, in 1926 and 1927, I made investigation and report on the proposed hydroelectric developments on the Menominee River and the White Rapids and Chalk Rapids, for Halsey, Stuart and Company of Chicago and the First Wisconsin Trust Company.

I was consulting engineer for the Cheat Haven plant of the West Virginia Power and Transmission Company, with 75,000 horse power.

Consulting Engineer, Sacramento Municipal Utility District, California, as to new water supply and power development on the South fork of the American River.

Also consulting engineer for the Washington Water Power Company, Spokane, Washington, dam for Lake Chelan hydroelectric development.

Investigation and report on hydroelectric development at Wisconsin Rapids, for the First Wisconsin Company, Milwaukee.

That was a hydro development that was very large—I do not remember the capacity. That was a 400 foot head and a pretty heavy flow. I am referring now to the project of the Washington Water Power Company, Spokane, Washington, for a dam for Lake Chelan.

Then I made an investigation and report on the hydroelectric development at Wisconsin Rapids, to which I have alluded, for the First Wisconsin Company, which is a Bank.

In 1928 and to 1931, I was a member of the Colorado River Board for the United States Government. I was appointed—I do not know when it was; I guess the records will show that. I examined the Imperial Valley and various irrigation works on the Lower Colorado Canyon and Colorado River, and these included the Boulder Canyon and the Black Canyon project in 1928, and we increased the estimate at that time from $125,000,000 to $165,000,000; that increase was not that much—by $40,000,000 to $165,000,000..

Reports and plans for the flood protection of Oklahoma River—I mentioned that—about a $10,000,000 proposition.

By Mr. JACKSON:

Q. Turn to 1932?

A. In 1932, I was still a Member of the Colorado River Board, and we approved plans for the Hoover Dam in November, 1932, at which time the Board finished its work.

I think it was in 1933 that I reported to the Illinois Central Railway in connection with the Bonnet Carre Spillway operation before the Federal Commission at New Orleans.

I think the same year, I reported on the hydroelectric development for the City of Spokane, Washington.

By Mr. JACKSON:

Q. I will ask you to omit some of these things, and I want to ask you whether or not you had anything to do with any plants on New River, in Virginia or West Virginia, in 1931?

A. Yes; through the New York office of Daniel W. Mead and F. W. Scheidenhelm, various investigations were made for plants on New River, in Virginia and in West Virginia.

Q. Have you had any connection with the Special Board for the Tennessee Valley Authority?

A. I am on the Board now, as consulting engineer about maximum floods in the Tennessee Valley; also I am Chairman of the Board of Review of the Sanitary District of Chicago, planning the expenditure of $56,000,000 for sewerage disposal.

Q. Have you published any scientific and technical books or writings?

A. Yes.

Q. Will you read a list of such books—not the articles that you have written.

A. I have a list here somewhere. I might explain that when I went to the University of Wisconsin, there were no available text books, and I published, before I went to Madison, certain notes on hydrology, which I think is the first publication on that subject in the United States; and when I took up the matter of water power, I was writing a book on that subject. There was nothing that covered it adequately.

Q. What book was that?

A. Water Power Engineering, published, I think about 1908, first, and revamped in different forms later on.

Another book was Contracts, Specifications, and Engineering Relations, published in 1916.

A book entitled Dam and Water Power Development at Austin, Texas, in 1917.

A larger and more complete work on Hydrology, published in 1919.

And a book, including my report on the feasibility of the Development of hydroelectric power on the Missouri River in South Dakota, published in 1920.

Also two volumes on Hydraulic Design, Estimate of Water Supply and Water Power of a River and the Design of a Hydroelectric plant, published in 1930. In 1930–1933, there was published my book on Hydraulic Machinery.

By Mr. **Jackson**:

Q. I show you papers that you handed to me, which contains a list of the papers you have written, in addition to these books. Is that correct. [Papers are handed to the witness.]

A. So far as I can make out, yes, sir; that seems to be correct.

Q. I will ask you to hand that list to the shorthand reporter and have them listed in the record.

A. All right.

By Mr. **Jackson**. Is that agreeable to you gentlemen? [Addressing opposite counsel.]

By Mr. **Thompson**. Yes, sir.

By Mr. **Jackson**. I will ask that they be included in the record without having the witness read them.

By Mr. **Jackson**:

Q. Are you a member of any professional or technical Societies?

A. I have quite a list of it. I will read them.

Q. Can you hand the list to the shorthand reporter, if that is agreeable.

By Mr. **Thompson**. That is all right.

By the **Court**. What are some of them?

A. The American Institute of Consulting Engineers, The American Society of Civil Engineers, American Society of Mechanical Engineers, Western Society of Engineers, American Water Works Association, New England Water Works Association, Wisconsin Society of Engineers, Illinois Society of Engineers, International Association of Navigation Congress, Society for Promotion of Engineering Education, American Association for Advancement of Science, American Academy of Political Science, American Political Science Association, American Forestry Association, American Meteorological Society, American Institute of Electrical Engineers, American Public Health Association.

A. (Continuing.) And there are others that I cannot now recall.

By Mr. **Jackson**:

Q. Do you hold any office in the American Society of Civil Engineers?

A. Yes.

Q. What is it?

A. I am the 1936 President; the President for the year 1936.

Q. Doctor Mead, do you have any business relationship with the defendant here, the Appalachian Electric Power Company?

A. Yes; both directly and indirectly. I have been associated with Colonel Scheidenhelm, since, as near as I can remember, since 1912, in New York, under the firm name of Mead—Daniel W. Mead and F. W. Scheidenhelm, Consulating Engineers, and I think, for about 11 years, my office has done considerable work for the Appalachian Electric Power Company.

Q. Have you been connected with the work or not?

A. Yes, sir—Yes and no—not intimately acquainted with it, because Colonel Scheidenhelm gives his special attention to it, and I come in occasionally, when he asks me to. My work is done largely in the West.

Q. Can you state what part of the work done by your firm for the Appalachian Electric Power Company, you are most familiar with?

A. I know more about the Radford project, in a general way, than any of the others, although as I said above, I did examine two sites on the lower New River in West Virginia.

Q. What were they?

A. One was just above Hinton, about one mile, and the other about 9 miles above, called Bull Falls.

Q. When did you make that examination?

A. I could not tell you.

Q. Was it sometime ago?

A. Yes, sir; some years ago. I appeared at that time before the West Virginia Rate Commission—is—I don't know the name, but they had jurisdiction over the granting of the license.

Q. I believe it is the West Virginia Public Service Commission?

A. Possibly so; I don't know the names.

Q. At the time that you made the examination near Hinton, was the possibility of constructing some project there under consideration?

A. Yes, sir.

Q. Did it have a name, do you know?

A. It had a name, but I have so many things in my mind that I cannot remember it. It was a dam above Hinton and Bull Falls dam, the latter being a very high dam and the other a re-regulating dam, as I recall it.

Q. Well, you say there were two dams—a dam and a reregulating dam?

A. Yes, sir; they were both dams, and the reregulating was more particularly the function of the smaller dam.

Q. Would that mean one high dam and one——

A. (Interrupting.) Yes, and one lower down and about a mile above Hinton.

Q. It was about a mile above Hinton?

A. That was the smaller reregulating dam and the other was about nine miles, I think, at Bulls Falls. I may be off as to the miles.

Q. You said you were more familiar with the Radford project. Are you acquainted with the details of that project?

A. No, I am more acquainted with the dam site and the reservoir. I have been there several times and examined the question of the location and other questions connected with the fundamental elements of the design.

Q. What is the extent of your acquaintance with New River?

A. Well, I should say it was limited to that examination that was made above Hinton; I remember that when I went on the Bulls Falls site and went up five or six miles further, and back through Indian Creek and went across the river again at some place—I do not remember the name, but I remember the poor supper we had there, and finally got to Radford—or the dam site at Radford.

Q. Were you ever at the Narrows?

A. We passed the Narrows, I think, somewhere; I think it was near that that we had the memorable supper.

Q. How often, if ever, have you visited the Radford dam site?

A. I cannot remember that; I should say three or four times; possibly more; but I am quite sure three or four times and I think at least three and I think four or more.

Q. Do you have any acquaintance with Kanawha River?

A. I have known in a general way of the Kanawha River for many years. I had occasion to lecture once for a good many years on the question of rivers and canals for navigation, and at that time, I knew pretty thoroughly about the lock and dam system on the Great Kanawha and the Ohio, and I visited some of the dams on the Ohio and I visited the Kanawha River, the first time at Point Pleasant, and went on to Charleston and stopped and examined some of the dams and locks, and I remember taking various pictures there.

By Mr. Thompson:

Q. How many years ago was that?

A. I should say that my first actual contact with the river must have been 25 years ago—possibly more; and of course these locks have been replaced or are now being replaced, and I have not seen the river since I was there—yes, I was at Charleston when I made the investigation of the Hinton site, but I have not seen the river since the new dams and the power plants were put in at two places; I understand there are three locks or dams and power plants, that are replacing seven original dams on the river."

By Mr. Jackson:

Q. Dr. Mead, what is the proposed storage capacity of the Radford project?

A. 100,000 acre-feet."

Q. What would be the equalized flow out of the Radford project if during the year of the lowest stream flow of record the storage capacity were utilized to bring about the largest uniform flow throughout that period?

A. It is about 1,200 second-feet—a little bit less than that, I think. In round numbers that is close enough for all practical purposes.

Q. Are you familiar with the methods of operating storage for a power development, such as the Radford project?

A. I have had to become pretty familiar with hydraulic plants, including reservoirs, which are quite often an important matter in connection with them.

Q. Over how many years has your experience in that regard extended?

A. Oh, I should say 30 years, at least.

Q. How could the operator of such a storage reservoir operate the project if an equalized flow of a minimum amount of 2508 1,200 second-feet was to be maintained?

A. The equalized flow, perhaps, ought to be explained. It is an equalized flow in a sense, but it is not used in a wholly equalized manner. That, when I say 1,200 second-feet, would mean that that was about the average rate at which it would have to be used. It might have to be used four or five times that amount for a certain length of time and even less than that amount a part of the time, but the average flow for 24 hours would have to be not more than that. In the operation of a plant, any plant, for the best uses of a stream, taking other parts of the year leading up to the dry season we would see that we did not exceed, say, the average weekly flow of the stream, and try and leave the reservoir full on the approach of the extreme dry weather. Occasionally before that time we might get less than what we considered the minimum, perhaps for a day. That might take a little water from the reservoir, which would be replaced the next. When the dry weather really came on, we would augment the natural flow of the stream to bring it up on a 24-hour or a seven-day period, or whatever the unit might be used, keeping always preferably within, say 1,200 second-feet, because it is a wise provision to take care of something that might be worse than we have ever known. So that it would be very poor policy to draw on your reserve supply except when absolutely necessary, for two reasons: Power is necessarily made up of weight and head. The weight of the water we are using and the head of the water. Where you draw a reservoir down, you reduce not only the quantity of water held but the head. With the head, you reduce the capacity of your plant, and good judgment always means that a reservoir of the fullest capacity possible be reserved as long as possible.

Q. Would that effect result on the average to stretch the storage out over the low-water season?

A. That is what we determine when we say 1,200 feet could be carried by use of 100,000 acre-feet of storage through the maximum dry period which we experienced, which would include the 2509 years 1925 and 1930. Both were low years, and I do not know which was the less.

Q. When you said 1,200 feet a moment ago, you meant 1,200 cubic feet?

A. 1,200 cubic feet per second used irregularly through the time, as long as the average for the day, or week, or month, did not exceed that amount. That is the measure that we have established, and it must not be exceeded for long intervals, the object being, of course, to have, at the end of the first month and the beginning of the second month, enough to carry through the balance of the dry season. At the end of the third month, you would have enough to carry through the balance of the dry season.

Q. Would it be feasible for the operator of the Radford project to utilize the storage, or to draw the storage down, in advance of the low-water season?

A. I suppose he might do it if he was not interested in getting the best results. It would be a very foolish proposition.

Q. Dr. Mead, are you familiar with the United States Geological Survey Stream Flow Estimates on New River for 1930?

A. Yes. I examined them.

Q. Have you examined the records for the gaging stations above Radford?

A. Yes, I saw that. I think I saw one above and one below. The one above I gave particular attention to.

Q. Doctor, I hand you a water supply table, duplicate of which has been marked "Government Exhibit No. 81," and I direct your attention to pages 62 and 63 and ask you what table is shown there, and whether you have studied the table?

By Mr. Thompson:

Q. Will you kindly tell what water supply table that is?

A. 698. I have looked these over, and one of them shows the approximate flow per day, September 26, 1929, to September 30, 1930. That is at Allisonia. The other is the same time—no: It starts October 1, 1929, and goes to September 30, 1930, at Eggleston. Eggleston is below, as I recall, and Allisonia is above.

2510 By Mr. Jackson:

Q. Dr. Mead, from your examination of the table showing estimates of daily discharge for New River at Allisonia, Virginia, for the twelve months ending September 30, 1930, as shown in "Government Exhibit No. 81," when, in your opinion, would the utilization of the Radford storage have been begun if the Radford project had been in operation in 1930?

A. With a full reservoir, there would be some very slight draft in June. I am supposing if intelligently used, there would have been some slight draft in June, when the flow went down apparently below 1200 second feet. About June 22, it ran down to 1,070, which is a little below probable flow at the Radford dam, as this flow is only about twenty miles up-stream and about ten percent under the probable flow at Radford. Then it goes down for the next day, and up the next to 1,270, and then it remains below 1,000 for about two months, when the dry weather flow would be augmented by the reservoir capacity and probably above the plant, and bring it up to not exceeding 1,200 second-feet. That is on an average. It might exceed it a day and be less the next day, but the average should be kept under 1,200 second-feet.

By Mr. **Thompson**:

Q. I don't know whether I understand it right; That is for two months it was below a thousand second feet, and at that time you were figuring on drawing from the reservoir?

A. Yes.

Q. To bring it up to 1200?

A. Yes.

By Mr. **Jackson**. Not more than 1200.

Q. Under that method of operation, would the storage be exhausted at any time prior to the end of the low water season?

A. Not unless—I don't know that it ever gets so low so you can't find some time it might go lower, and, therefore, you should cut under 1200 feet. It may occur.

Q. You said in the first part of your answer, assuming, at the commencement of the low water season, the reservoir was full, please state whether, in your opinion, under proper
2511 operation the Radford reservoir would have been full at the commencement of the low water season early in June?

A. Under proper operation it certainly should have been filled and practically full at the time of the low water season. We have had quite a number of years of it and we know practically what we strike.

Q. Would you consider it a reasonable or an unreasonable method of operation if, under conditions disclosed in 1930, the utilizable storage of the reservoir had been depleted, or exhausted, prior to June 22nd, or 23rd, 1930?

A. I should consider it an inexcusable blunder.

Q. Are you familiar with the load requirements of the system of the Appalachian Electric Power Company?

A. No, I don't know anything about it except in the way, as I have stated, of loadcurves in pretty near all the country in the main plants. I do not recall that particular load curve. I may have seen it and presume I have.

Q. Does that fact in any way affect the opinion which you have expressed with regard to the method of operation which would have drawn down or exhausted the Radford reservoir prior to June 22, 1930?

A. None whatever.

By the COURT:

What was the date, during 1930, when the stream flow was returned to as much as 1,200 feet?

A. It did for four days in August, but it went down again. There was evidently rainfall somewhere. Well, there were four days in August, and then it kept under 1,200 feet up to the 17th of November, when it was up for a few days, then it was down and up, and a few days were below in December, and one day it was below in January, no two days below in January, but in general it was getting back up about 1,200, some days as high as 9,000. It varies as those rivers always do. By the 1st of December or 2nd of December it got up to 1,230 although there were two or three days when it was below 1,200 later on.

2512 Q. That is according to the gaging station upstream from the dam site?

A. Yes, sir; which really should be increased about 10% I think for the Radford dam site.

Q. You stated earlier in your testimony, Dr. Mead, that this uniform flow which could be produced by the 100,000 acre-feet of Radford storage, was expected to be approximately 1,200 second-feet?

A. Yes, sir.

Q. Did that estimate of 1,200 second-feet take into consideration the low water season or experience of 1930?

A. It was based on the two low water periods of 1925 and 1930.

Q. Is that sort of an estimate based on the worst years or the best years?

A. Those were the two worst years, that is what we always base reservoir studies on.

Q. Are you familiar with the Bluestone reservoir project as it is described in the report of the Army Engineers, which is in evidence here as Government Exhibit #145?

A. In a very general way, yes, sir.

Q. Do you know what height of dam is contemplated by that project?

A. My recollection is about 150 feet for the combined project I take it for flood protection and power.

Q. Do you know what the storage for flood control is, the amount reserved for flood control?

A. Of course all I know and all anyone knows is what is estimated in that report, because there is no such thing, 150 feet, and the upper 30 feet is supposed to be reserved for flood control, and has a capacity as I recall it of about 236,000 acre feet. I wouldn't be positive without looking up the figures. I think I noted them somewhere. (Referred to file.) Well I have it 235,000

acre-feet and the power storage I figured would have a maximum head of about 120 feet and about 286,000 acre-feet total
2513 capacity, including a certain amount that was to be reserved for freshets, but which I take it was also to be used for power.

Q. Did you mean 286,000 or 268,000?

A. I gave two figures.

Q. The last you gave was 286,000 reserved for power and I thought you had maybe misread your note?

A. It was 235,300 acre-feet, which allowed 5 feet above containing 32,700 acre-feet for freshets, and the two together—I take it freshet water was to be reserved and saved, as would be the intelligent thing to do—the two together would be 268,000. I think there is a slight indefiniteness in that report. I could not check one or two figures. One gave more than the other. This was stated directly 268,000 I recall in the report.

Q. Do you know whether part of this reservoir is devoted to power?

A. This 268,000 I understood was to be devoted to power purposes.

Q. Is that what we sometimes refer to as utilizable storage for power purposes?

A. Yes, sir.

Q. Please state whether in your opinion the operation of the Radford project would have any adverse effect upon the Bluestone project?

A. I don't see how it could have any adverse effect under any reasonable intelligent use.

Q. Do you think the Radford project would have any effect, adverse or favorable, upon the Bluestone project?

A. I think it would be entirely favorable in general. It really consists of 100,000 acre-feet additional capacity for Bluestone.

Q. Are you referring to storage now?

A. Yes, sir.

Q. Will you explain a little more fully the reason for your opinion as to the fact the effect would be beneficial?

A. Well it is just the ordinary principle we have on
2514 every reservoir where we are reserving water for storage purposes. We frequently have one dam above the other and it is the common attempt to utilize the storage so it will be of the greatest benefit to all concerned, but which cannot quite be accomplished in that way when the plants are in the hands of different interests, but universally there is a benefit from the upstream storage of water; it is simply holding back the floods that would pass off at a time they cannot be used, and putting them into the low spots where they can be used.

Q. How would that affect the possible power production at Bluestone?

A. It increases it, and as a rule that is what we are aiming at in these reservoir systems.

Q. What, if any, effect would the construction and operation of the Radford project have upon the Bluestone project from the standpoint of silting?

A. Without the Radford project the silt would be carried down into the Bluestone, and with it nothing but the finest material would ever reach the Bluestone or the river below. The up-river dams have a great advantage in that way, which sometimes are very serious, but I don't regard it as serious here as in the Boulder Canyon project. Unless we get some up-river projects we won't have any project there in 200 years. We will have thirty million acre feet of silt instead of thirty million acre feet of water.

Q. As I understand you—— [interrupted].

A. The Radford plant would keep the silt out of the Bluestone you call it.

Q. That is the silt would stop in the Radford reservoir?

A. Yes, everything except the very finest silt which in some cases, I don't know if in this river or not, but in most rivers certain silt will remain in suspension as long as any motion at all persists and sometimes after motion is stopped, but that is of no moment, because it will go right on down to sea eventually.

2515 Q. That is it would pass through the Bluestone?

A. This very fine stuff remains in suspension for days. Stuff like that would simply go down until it gets into the salt water. It doesn't amount to anything in volume.

Q. Going back a moment to your testimony that in your opinion the construction and operation of the Radford project would have a beneficial effect upon the production of power at Bluestone, will you explain how that additional 100,000 acre feet of storage at Radford would be used by the operator of Bluestone to benefit the Bluestone Reservoir?

A. Well it would replace an equal amount of water that might be used in power or it would increase the power output that could be obtained from the Bluestone project if more power was desired, without additional lowering of the Bluestone reservoir. That is, it would take the place of some used or it could add to the amount used.

Q. Am I right in understanding that would either mean more power would be produced at Bluestone or that the Bluestone reservoir would be maintained——[interrupted].

A. It would mean more power or more head.

Q. Are you familiar with the subject of fluctuating discharges from water power stations?

A. I have seen several.

2516 By Mr. JACKSON:

Q. Dr. Mead, at the adjournment Friday I had just asked whether you are familiar with the subject of fluctuating discharge from water power systems?

A. I am.

Q. For what period of time have you been familiar with that subject?

A. Well, I should say 50 years.

Q. What, in your opinion, would be the effect of the Bluestone reservoir, about which you testified Friday, upon varying discharge of power tides which might be produced in the operation of the Radford power station?

A. In general, the effect would be an equalizing effect.

By Mr. JACKSON:

Q. Will you state somewhat more in detail what, in your opinion, would happen to any power tides produced by the operation of the Radford station when those power tides reached the Bluestone reservoir?

A. In general, the tide would spread out over the reservoir and raise the water in the reservoir in proportion to the quantity of water in the tide.

Q. State whether or not, in your opinion, the power tide would pass through the Bluestone reservoir as a tide?

A. Not without change in form and quantity. If the reservoir was full, the water in the tide above the quantity necessary to fill the reservoir would naturally overflow and pass on down the river but have a different distribution in the quantity and in the distribution of the tide itself. If the reservoir were not full, it would simply spread out and add to the head of the reservoir.

Q. When you say if the reservoir was not full, which reservoir do you refer to?

A. I was speaking of the Bluestone reservoir.

Q. If the Bluestone reservoir were not full, what would control the nature of the discharge below Bluestone—the tides from Radford, or the method of operation of Bluestone?

2517 A. The operation of the gates or plants which, I understand, are installed in connection with the Bluestone dam.

Q. Under the circumstances last described, would the Radford power tide appear at all in the stream below Bluestone—that is when the Bluestone reservoir was not full?

A. Not as a wave—not as a tide. The water would, of course, continue to go down-stream unless it is conserved and held in the reservoir.

Q. Would any power tides from the Radford reservoir, under such circumstances, be recognizable in the stream below the Bluestone reservoir?

A. No, not as a tide, under the conditions that it left Radford. It would change in form entirely.

Q. Assuming that the Bluestone reservoir were partly empty, what would control the form of discharge in the stream below the Bluestone reservoir?

A. It would be entirely controlled by the operation of the power plant or gate at Bluestone.

Q. You first referred to the condition where the Bluestone reservoir might be full: Under those circumstances, what would be the effect, if any, of the Bluestone reservoir on any power tides from the Radford station?

A. The power tides from the Radford station would normally flow into the reservoir, spread out, and be reduced in height. If, as I understand the question, the reservoir were full, it would gradually spill over, increasing in volume as the depth increased, or it might pass through the power plant if the power plant were placed in operation and the demand for power be sufficient to utilize it.

Q. Assuming the Bluestone reservoir were full, and the Radford power tide spread out as you have described it on top of the reservoir, what would be the effect, if any, of that circumstance upon the form of the Radford power tide, if and to the extent it passed from the Bluestone reservoir?

2518 A. The form of the power tide would change entirely. It would simply begin to spill over as the level increased until a sufficient amount were spilled over to take care of the water.

Q. Would that involve the increasing or decreasing the amplitude of the tide?

A. It would decrease the amplitude of the tide. If the tide were very, very, small, and even then the spreading out would decrease any tide, as far as that is concerned.

Q. What, if any, use of the gates at the Bluestone dam could be made under such conditions to make the outflow uniform?

A. If the reservoir were full to the flood level, the gates could be used to control to the capacity of the gates and equalize the flow as might be desired, made large or small, but no smaller, of course, than the amount entering the reservoir.

Q. Well, would the gates be sufficient to fully equalize any power tide that could be produced by the Radford power plant, or not?

A. Yes, it is sufficient, I understand, to take care of action in flood, and the tide from the Radford plant, or any other plant, would be a comparatively small amount.

By Mr. **Jackson**:

Q. Do you know what the hydraulic capacity of the Bluestone reservoir is in second feet?

A. Only in a general way. I understand it is about 10,000 second-feet—possibly a little more than that. I think it is somewhat larger than the proposed plant up the river, which is 9000 second feet, with the reservoir full.

Q. Dr. Mead, referring to this special condition when the part of the Bluestone reservoir reserve for power purposes might be full and the flow into the Bluestone reservoir in excess of the hydraulic capacity of the Bluestone power installation, 2519 or, as appears from Exhibit 145 in excess of 11,000 second feet, and the Radford power station be simultaneously operating on a peak load basis, please state whether in your opinion this coincidence of circumstances would be likely to occur?

A. It is very unlikely, I should say.

By Mr. **Jackson**:

Q. Will you state the basis of your opinion?

A. There are so many provisions there, I think possibly in one or two of the preceding questions this morning, I misunderstood. I thought when you spoke of the Bluestone Reservoir being full, you referred to not only the power but to the flood storage. My answers were given in the first place with that in view. The general scheme of the Bluestone reservoir, of course, is to keep five feet for freshets, and I take it that that would be the usual course. It would be only under exceptional circumstances in which a freshet had just occurred and is then followed by a discharge of 11,000 feet plus the peak load from the plant above, a condition which is hardly conceivable.

Q. Well, Dr. Mead, assuming the Bluestone reservoir were full to the extent of the power capacity, and that there were an in-flow in excess of 11,000 second feet in the Bluestone reservoir, what, in your opinion would be the likelihood of the Radford plant being concurrently operated on a peak load basis?

A. The peak load capacity of the plant above at Radford would normally only be used for a very brief period, perhaps an hour or more in any one day. The coincidence of the peak in a flood, either from above or below, a peak load at the same hour would be very unexpected and unusual and would hardly be anticipated to occur.

By Mr. JACKSON:

Q. Dr. Mead, assuming that the Radford reservoir were full, and there were a flow in the Radford reservoir of approximately 9000 second feet, state whether or not in your opinion the Radford plant would be operating on a peak load?

2520 A. In the operation of plants such as the Radford plant, it is the purpose to get as much power out of it as possible, and it would probably be operating as far as possible at the maximum load that could be carried. It might be no peak at all, but a steady discharge at or near its maximum capacity.

Q. Assuming the Radford reservoir were full, and there were a flow into the Radford reservoir equal to the hydraulic capacity of the Radford power installation, state whether or not in your opinion the Radford power plant would be operated on a peak basis during the continuance of that condition.

A. I should say not.

By Mr. JACKSON:

Q. Why?

A. A peak basis necessarily means that during the day the plant would be operated from a low basis to a high basis, the higher basis being what we would call the peak. With the capacity of the plant coming into the reservoir, I should consider the proper operation would be to run the plant as nearly to its capacity as possible, and practically eliminate all questions of peak and run it essentially uniform and as near the capacity of the plant as possible.

Q. Would it involve waste of water under those circumstances?

A. No waste.

Q. Dr. Mead, are you familiar with the power development at the navigation dams of the United States on the Kanawha River?

A. I know something about the capacity and location, but I have never seen them, and have never examined in detail the plans.

Q. Do you know what power developments have been built or are in process of construction at navigation dams on the Kanawha River?

A. I am informed that there are two completed and one under construction.

Q. Will you state whether in your opinion the potential power out-put at the Government navigation dams on the Kanawha River would be injured or benefited by reason of the existence and operation of the Radford power project?

A. It would be benefited.

2521 Q. Will you explain a little more fully the reason for your opinion?

A. The storage of water from the high flows and its release at low water is in general beneficial to power plants further downstream below the storage, and the benefit would result in either the case of the Radford plant alone or the Radford plant in connection with the Bluestone.

2522 Q. What effect, if any, would the existence and operation of the Radford power station have upon the low water flow available for power at the Government navigation dams?

A. It would increase the flow at the Government navigation dams.

Q. What effect, if any, would the existence and operation of the Radford power station have upon the head available at the Government navigation dams, available for power at the Government navigation dams?

A. When ever the Radford reservoir reduced the high water flow it would to that extent relieve the over-flow and the loss of head at the dams. I understand they are drowned out during extreme floods and the period which they would be drowned out would be shortened.

Q. Under what circumstances would the Radford reservoir reduce high water flows?

A. Under flood conditions in which water was being stored at Radford.

Q. What would be done with the stored water?

A. It would be held for power purposes during the low water period.

Q. Dr. Mead, in the course of your engineering experience, have you been familiar with the stream flow records of the U. S. Geological Survey?

A. I have.

Q. Assuming stream flow records of the U. S. Geological Survey, which indicate that the flow at an upstream gaging station for a given period of a week or more was substantially greater than the flow at a downstream gaging station, taking into account the lag in the flow from the upstream to the downstream station, what, in your opinion, would be the reliability of those records in the case of New River?

A. I should think it would lead to the conclusion of inaccuracy in the measurement, perhaps in the rating curve or in the data on which the rating curve was established or in the reading itself.

Q. At which gage?

A. At the upper gage that showed more water than would be found downstream.

Q. Will you state whether it might indicate the downstream gage reading was inaccurate?

A. It might indicate either one was inaccurate.

2523 Q. In your opinion, Dr. Mead, where an estimate of stream flow in the records of the U. S. Geological Survey for an upstream gaging station on New River, shows a greater flow than the corresponding flow shown by the same records for a downstream gaging station on New River, allowing for the necessary lag, could that discrepancy be explained or accounted for by losses due to evaporation or seepage?

A. Only in the event the difference was very small and not greater than the evaporation.

Q. Can you give any indication of the order of that difference?

A. Well if it was 100 second feet I should say it could not be due to evaporation.

Q. State whether the amount of evaporation would or would not be likely to be within the limits of errors of estimates in stream flow?

A. Commonly I think they would.

Q. How long and to what extent has your hydraulic work involved the study and use of U. S. Geological Survey estimates of stream flows?

A. Ever since there were any such records.

Q. For about how many years have you worked with U. S. Geological Survey estimates of stream flow?

A. I don't remember the exact date which the U. S. Geological Survey began their work. I remember there was some work done about 1893. When I first began work on rivers there were no Geological Survey measurements being made. They have developed in later years, and I think began somewhere after 1890. The first records are published in the annual reports of the Director and later they appeared and were called "Water Supply and Irrigation Papers." I think they are now called "Water Supply Papers," some six or seven hundred of them have been published.

Q. Please state from your experience what is the range of accuracy of the U. S. Geological Survey estimates of stream flow?

A. A great many of the earlier reports were quite inaccurate. That is, the readings were quite inaccurate, or the relation between the readings and the actual flow. They have greatly 2524 increased in accuracy with the experience of the Survey, but only as a general indication. I would not want to count on them closer perhaps than 5%, and the earlier ones were sometimes off a great deal more than that. That is, they were off sometimes very far.

By Mr. **Thompson**:

Q. You said the earlier ones were quite inaccurate. Would you give a figure there?

A. It depends upon the location. Some of the earlier ones were pretty fair and some entirely misleading. I always try to look into them as thoroughly as possible before using them, and I use the older records with a great deal of reluctance unless I have some substantial way of checking up their probable accuracy. The methods have been developed within the last few years, in fact the last ten years have been a very great improvement in the methods used.

By Mr. **Jackson**:

Q. In engineering work do you accept the present estimates without checking them?

A. I always try to check any data we use as far as practicable.

Q. State whether stream flow estimates involve matters of judgment?

A. Yes, all measurements require judgment.

Q. Dr. Mead, have you any acquaintance with the Water Supply situation at Charleston, West Virginia?

A. I had at one time. I don't know just what it is at the present time.

Q. When did you last have any knowledge about it, as of what date?

A. I believe it was September 1930 when I was before the Commission at Charleston. The Commission asked me to go up and look at the works of the Water Company and to advise them as to whether or not they were doing all that could be expected in the way of furnishing pure water to the city. I did make such an examination and reported to the Commission informally, verbally, that I thought they were doing all that could be expected at that time.

Q. What was the source of the city water supply in 1930?

A. It was supposed to be from the Elk River.

2525 A. (Continuing.) The Elk River had almost stopped flowing and the flow was not at that time sufficient to furnish the needed water supply for the City of Charleston. The result was that the Kanawha River was flowing upstream and was flowing over some garbage, which the city had allowed to be dumped at the mouth of the river.

Q. Did you mean the Kanawha River?

A. No; the Kanawha River was flowing into the Elk, to supply water which the Elk could not furnish, which was polluted with garbage the city had permitted to go into the mouth of Elk River, which ordinarily would have flowed out, but at that time was flowing in, and the water supply was polluted. They had to chlorinate the water, and were at that time furnishing very satisfactory water, as satisfactory as could be expected from a polluted source.

Q. Dr. Mead, are you familiar with the estimates of the U. S. Geological Survey as regards stream flow of the Kanawha River during the year 1930 and especially during the low water season of that year?

A. I have examined them. I haven't them all in mind. The records are here, I believe.

Q. I direct your attention to Water Supply paper #713, at pages 66 and 67, Exhibit #82, that is the record of the estimates of the U. S. Geological Survey for stream flow on the New River for 1930, and especially the low water season?

A. The two pages referred to are "The Kanawha River at Kanawha Falls", and the other page is "On the north fork of the New River, Crumpler, N. C."

Q. I direct your attention particularly to the first page dealing with the flow at Kanawha Falls, and ask if you are familiar with that?

A. I have seen it and looked it over.

Q. Will you tell me from your examination of Government Exhibit #82, Water Supply Paper #713, page 66, what was the estimate of flow for New River for October, 1930?

A. The mean or average flow is given as 1130 second feet.

2526 Q. Dr. Mead, assuming (1) that as testified by the witness Pierce in this case the mean flow at the Radford dam site was 759 second feet for the month of October, 1930, and (2) that all the new roller gate type of navigation dams on the Kanawha River and the new roller type navigation dam at Gallipolis on the Ohio River, were completed and in operation, and (3) that the requirements for maintaining the navigations pools on the Kanawha River at their project levels are not more than 200 second feet, what, if any, effect would cutting off the flow at the Radford dam site for a period of forty-eight hours during a month such as October, 1930, have on the navigation pools on the Kanawha River?

A. It would have no effect on navigation.

By Mr. Jackson:

Q. Why?

A. Well, the difference between the two, that is, figures of the flow at Kanawha Falls and at Radford, would still leave 371 second feet, which would be ample for navigation if the amount of water used did not exceed 371 second feet.

Q. Have you finished, Doctor?

A. Yes.

Q. In that question I asked you, upon the hypotheses assumed, what would be the effect, if any, of cutting off the flow at the Radford dam site for 48 hours. In your opinion, would the result be any different, so far as the navigation pools are concerned, upon the hypotheses assumed if the cut-off were longer than 48 hours?

A. It would not.

Q. Why?

A. Because the flow would be sufficient to take care of navigation—the remaining flow.

Q. As a matter of practical operation, of the Radford power station, or any other station, with storage, would any other considerations affect the probability of cutting off the flow for longer periods of time during low water season?

2527 A. If we assume intelligent operation, no such condition should occur, for the purpose of the reservoir is to provide additional flow instead of subtracting from the flow at low water stages. It is the very purpose of the reservoir storage.

Q. Going back to the matter of stream flow, Dr. Mead, I neglected to ask you one question about which I wish to inquire. Do the same gauge heights at a given gauging station in a given stream always mean the same flow past that point?

A. Not necessarily.

Q. Will you explain the reason for your answer?

A. I presume I can show it better by a sketch, if you desire an explanation.

Q. Will you proceed then with your explanation?

A. I will draw a line representing the slope of the bed of the stream. In establishing the stream gauge we attempt to select a portion of the river that is fairly straight and fairly constant in condition, frequently selecting two stations more or less adjacent. The vertical line "A" represents one of the stations and "B" the other, depending on the size of the stream. It might be in a small stream not more than 50 feet, in a large stream a couple of hundred and perhaps in a large river like the Mississippi, half a mile. If I draw a line representing the flow of the stream when the same volume of water is passing station "A" and station "B", we have a condition that would ordinarily be called the normal flow of the stream. I was saying when the same amount of water is passing the station "A" and the station "B," we have a certain gradient and we normally call the condition the normal flow. Now, we have at various times during the season advancing and retiring floods, that is, the flood comes down the stream in increased flow. It can't pass this station without increasing the height and the corresponding

gradient. The flood comes on and we may come up to a point in here [indicating] and may get a temporary gradient represented by this particular line where the water is rapidly
2528 beginning to increase the volume at station "A" and beginning slowly to increase at station "B." The slope has increased and the amount of water passing station "A" is much greater at that particular time than the gauge height would seem to indicate.

Q. Mark the last gradient or last line you drew "C."

A. We will mark the first one "N" as the normal flow at that period. The new flow I might mark "N^1." The flood wave is coming in here and the conditions are not normal, not normal flow. Gradually this lower station begins to fill up and we get a condition perhaps where the flow at station "A" is higher than it was and station "B" has come up to a condition of normal flow, that is, with its higher water and under normal conditions the flow is the same at both points. As the flood goes by it may have risen considerably above the point I have marked "N^1" and the flood is beginning to subside, and there becomes a change and possibly we have a new line established, a line of flow where the upstream condition of gauge heights remains constant but the slope has decreased. Under this condition, which I will mark "3," "2," and "1"—"1" referring to the line with the greatest slope and "3" with the least slope. We might have all of these read at the same gauge height, but the amount of water passing would depend not only on the gauge height but on the slope, because it is slope that determines the quantity of water and that means simply the temporary advancement and retiring of waves. I think perhaps on the side, if I may be permitted, I might represent this by showing the formation of what we call a rating curve. The exact process of that is selecting the gauge point at which you wish to develop a regular gauging station. We measure the water ordinarily at the present time by a high grade current meter, which has been wonderfully developed since the early days. In my earlier experience we used to use floats where the selection of the channel was exceedingly important. We would take floats and time them between two stations. With varying distances across the river, their position would be carefully chartered and the time they passed the lower line, but at the
2529 present time we would probably start at this station and make observations at various depths and at various points in the cross-section. We would find that when this slope was an abnormal slope, that is, increasing more rapidly than the normal, the discharge by this point would be higher. In other words, our current meter readings might show—let me carry this point right across here on the gauge and I might determine it by three

readings under different conditions, advancing flood, normal flow, and retreating flow. This line would now represent quantities of flow and vertical gauge height. I might get, corresponding to this particular gauge height, three flows. When I determined other points, I would finally get a line in general corresponding to the curve that I have indicated there which I haven't made as heavy as perhaps you desire. That curve should pass through the point that I measured when the flow was normal. This point would mean that the flood was retiring, in other words, that the gradient was less than the normal gradient. This, which would show an excess flow, means that it was measured when the flood was advancing, when the gradient was more than normal and the quantity of water was greater. These would represent, and frequently do represent, such measurements, and then we are obliged to investigate the flow of the stream and establish a place where we can keep a constant watch on it. If we find a variation and if the work is accurate, it simply means they were made with a rising and falling river. If it is made with a normal flow we would get a series of points that would fall on the line. They will fall a little off, due to inaccuracy in the measurements, because, after all, a current meter is not an exceedingly accurate affair. It is only an approximate indication of what the stream or the body of water, canal, or whatever it may be, is flowing. It gives the velocity at various points in the vertical and also the horizontal of the cross-section and from that we establish a rating curve from which anybody can go to this gauge and read the gauge and turn to either a rating table or rating curve, which is a little more convenient, and find the elevation and read from the horizontal scale the approximate amount of water that is flowing at that time. The reading is off if there is a re-
2530 treating or advancing flood at that point. It is fairly accurate if the flow happens to be normal. I don't know how clearly I may have made this but it is a well-known condition that is familiar to everyone that is doing stream work. It is very common for a hydraulic engineer to have to make curves of this sort and observations because they are only made at certain locations on a river and we usually want to know what the difference is between the gauges that have been read by the existing facilities and the ones that would actually take place at the sites chosen for the development of the power plant.

Q. Dr. Mead, does normal flow, as you have used it in your illustration, mean the same as an established or steady flow?

A. I would say a steady flow, yes. I don't know what you might mean by an established flow.

Q. I meant the same thing.

By Mr. Jackson. I will ask the reporter to mark the chart upon which the Doctor has just made a diagram used in connection with his explanation as Defendant's Exhibit 599. I offer the chart, marked Exhibit 599, in evidence as part of the testimony of this witness.

Cross examination by Mr. Thompson:

Q. Doctor, on that exhibit 599, isn't it true that the United States Geological Survey has slope correction methods by which these slopes are adjusted to normal and these apparent discrepancies corrected before the results are published?

A. They endeavor to correct them before they are published. They are usually issued in a preliminary form and later in a corrected form.

Q. And that is what we get when we get them in the books, do we not?

A. Supposed to be. Usually it is.

Q. Do you not think, Doctor, that the efforts of correction are quite successful and reliable?

A. Oh, I think in general, yes. I think they do admirable work.

Q. Doctor, I was very much interested in your statement of your qualifications, particularly interested in Boulder Dam as I have had something to do with it. The Boulder Dam Project was built, was it not, upon information to a very, very great extent derived from the reports of the Geological Survey?

A. The Geological Survey made, I think, the first investigations. The Dam was, of course, constructed after detailed
2531 investigations were made at various sites.

Q. Wasn't it true that when they had the dispute between the Seven States as to the division of water that they relied enitrely upon the stream flow reports of the Geological Survey?

A. Well, I don't know to what extent they relied on them. As a matter of fact, those measurements at Yuma, of which they had twenty years' records, were not made by the Geological Survey. They were made by the Reclammation Service until very recently. They are now made by the Geological Survey.

Q. And didn't the records that they had at Lee's Ferry Dam or Lee's Ferry Bridge—you know where that is—up in Arizona?

A. Yes.

Q. Weren't they made by the Geological Survey?

A. I think they were. They are making them, I think, at all the stations on the river at this time.

Q. Did you happen to attend the meetings of the States when they had the hearing at Sante Fe out at Bishop's Lodge?

A. No, I did not.

Q. From your records and your reports and writings which I have read, and which are intensely interesting, isn't it a fact that there they had the Geological Survey reports and that the States accepted those reports as to stream flow without question?

A. It would all be hearsay. I wasn't there and I don't know what they accepted or didn't. As a general proposition I know that the Recla*m*mation Service has accepted those: as a matter of fact, our Colorado River Board couldn't agree to them, because we found them very inaccurate. It is a very difficult place there at Yuma. I think perhaps it is one of the most questionable gauging stations anywhere in the United States.

Q. Isn't that due to the fact that the tides of the ocean come up there?

A. No, they do not, within 100 miles. They come up to the head of the Gulf of California, but that is 100 miles away from Yuma, or about that.

2532 Q. But there was no dispute, was there, about Lee's Ferry?

A. I don't know that there was any dispute anywhere except that our Board believed that the average annual flow of the Colorado River was greatly over-estimated.

Q. And you had estimates, did you not, from the Geological Survey reports up in Colorado and Utah and down in Arizona?

A. We used them from various places, on the Salt River, and on the Grand River, on the Rio Grande, and other places.

Q. And they are really the main source of information for engineers when they are out working on rivers, such as you have, in building dams?

A. The best source ordinarily available, yes.

Q. In the Colorado River, you talked about the subject of silt which was also intensely interesting and I believe that you were one of those, were you not, who said that this silt would be a serious question with the Boulder Dam and that they would eventually have to build some kind of a reservoir above there?

A. I thought, then, and still think that the silt proposition is a very serious one, and that the dam will ultimately be rendered entirely useless on account of the depositions of silt.

Q. And I agree with you on that, unless they do something to stop that silt. Wasn't there a very, very strong recommendation and almost a fight to have a dam put up at what is known as the Glen Canyon area on the river, so as to prevent this silt coming down, the Glen Canyon dam making a very long pool where the silt would settle gradually?

A. Well, there is a pretty long pool behind the Hoover Dam at the present time, nearly 100 miles long, I think. There was talk of dams at points upstream. There have been so many of them that I don't recall each individually.

Q. Do you keep in touch with the Recla*mm*ation Service?

A. In a very general way. I know a great many of them and they send me most of the important documents.

2533 Q. Do you know that the Recla*mm*ation Service has given out the statement publicly, repeatedly, that the pool is already 100 miles back of the dam at Boulder Dam?

A. Yes; I understand it is.

Q. And that boats are running up and down there of fairly good size, that is, motor boats and the boats of the size of tug boats?

A. I don't know of anything except taking tourists up and down.

Q. And you knew, didn't you, from your study and your reports that the head waters of navigation was the Virgin River which comes down out of Zion Canyon?

A. I know that in the earlier times when the river was more open they did take small boats up as far as the Virgin River.

Q. They couldn't get a boat of any size up above Boulder Canyon but they would get out there and take what they call skiffs and go up as far as the Virgin River?

By Mr. JACKSON. I object to this as not proper cross examination. It has no relation to the examination in chief.

By the COURT. Objection overruled.

By Mr. JACKSON. May our exception be noted?

A. I know that there was some primitive navigation on the stream up to——

By Mr. THOMPSON:

Q. Virgin River. Now, you also said, didn't you, that there would have to be a re-regulating dam down below Boulder Dam?

A. I don't remember making any such statement.

Q. Don't you recall having made that statement before the West Virginia Commission in discussing the Boulder Dam?

A. I don't remember ever saying so. I didn't know that I mentioned the Boulder Dam before the Commission. I may have done so.

Q. I will be glad to show you a little later.

A. I will be very glad to see it.

Q. Would you think that a re-regulating dam would be necessary below the Boulder Dam?

A. Well, I don't know what its purpose would be. Of course, they are building a dam down at Parker now to take the water out for Los Angeles.

2534 Q. And the Parker Dam will be a re-regulating dam?

A. It would amount to that, I expect.

Q. In your report and writings on this subject, you recall, do you not, that there was no navigation for sixty years or more on the Colorado River from the Boulder Dam site down to Yuma?

By Mr. **Jackson**. I object to that as not proper cross examination and having no relation to the examination in chief.

By the **Court**. Objection overruled.

By Mr. **Jackson**. May our exception be noted?

A. I know there has been no navigation there recently. I don't know how many years.

By Mr. **Thompson**:

Q. That is what the Seven-States Pact said, wasn't it, that there wasn't any navigation on there for the last sixty years?

A. I presume that is true, if it says so. I don't remember the details of what they said or didn't say, but there has been no navigation for a long while.

Q. Didn't they also find in this report on the Boulder Dam, of which I think you were a member, that the discharge from Boulder Dam would create a situation where they could have navigation from Boulder Dam down-stream?

A. I don't remember that.

By Mr. **Jackson**. May our objection be noted to this as improper cross-examination?

By the **Court**. Objection overruled.

By Mr. **Jackson**. May our exception be allowed?

By Mr. **Thompson**:

Q. I would like to ask you about the situation on New River with respect to dams. I believe that you said that you had investigated the Radford site two or three times or it may have been four times?

A. I have been to the Radford site and made certain examinations and determinations.

Q. And you knew, did you not, that there were dams above the Radford dam?

A. Yes.

Q. There was Washington Mills Dam and the Buck and Byllesby Dams and then there were a number of very good dam sites, were there not, above the Radford dam?

A. I understand so. I never made any extensive examinations above, but I have no doubt that is true.

2535 Q. And you knew that there were dam sites below the Radford dam?

A. Yes.

Q. Some very good dam sites down the river, were there not?

A. Well, there were dam sites. I don't know what you may mean by very good ones.

Q. Where you could have created a pool and created power from them?

A. Sure, there were a great many places where you could do that along the New River.

Q. There was a dam site at Hinton, wasn't there?

A. About a mile above Hinton was the one that I examined.

Q. Then below Hinton there is the Sandstone Dam site? Do you recall that, about ten miles below Hinton?

A. No, I don't. I have never been to that. I have passed it on the train, but I don't know anything about it.

Q. You do know, do you not, in a general way, that the whole canyon or rather I believe they call it a gorge from Hinton down to Kanawha Falls, is susceptible of the construction of dams for the creation of power?

A. I presume that is true.

Q. And you know, of course, that the Electro-Metallurgical Company has a dam at what is know as Glen Ferris or Kanawha Falls?

A. I understand so.

Q. And that the Kanawha River is a series of pools created by dams?

A. Yes.

Q. So that as this New River and Kanawha River are looked upon, let us say, as one connecting stream, there is a situation where a great many dams could be located and power created?

A. Yes, I think that is perfectly true.

Q. You think also, do you not, that the creation of hydro-electric power on that river, should be under the control of one corporation; isn't that correct?

A. I think you would get the most out of the river by a single control, possibly. I don't know that it is at all necessary.

2536 Q. And if you had a competing corporation, let us say, down in North Carolina, but up-stream, that was controlled by a company in that State, might there not rise conditions where there would be some trouble between that corporation and the corporation down below, let us say the defendant here at Radford, if the two of them got into a very dry season and were trying to conserve water?

By Mr. Jackson. I object to that as irrelevant and immaterial.

By the Court. What is the purpose of that, Mr. Thompson?

By Mr. Thompson. I am trying to get the witness' view now as to stream flow and the effect of stream flow on this river. They have certainly spent a lot of time on stream flow—and how it will affect navigation and is going to affect power and everything else.

By the COURT. Is it suggested that it would be advisable for the Federal Government to control everything on the river?

By Mr. THOMPSON. I didn't say the Federal Government.

By the COURT. But you said one authority.

By Mr. THOMPSON. I said one corporation, Your Honor. Isn't that a fair question?

By the COURT. It might be a fair question from a business standpoint, but I don't see that it has anything to do with the case.

By Mr. THOMPSON. Suppose that you had one corporation in one State that is expressing views and acting differently from what another corporation would want, wouldn't that create some situation on the river?

By the COURT. It might.

By Mr. THOMPSON. That is what I am asking him.

By the COURT. What has that to do with the merits of the case we are trying?

By Mr. THOMPSON. Because you might not have the capacity down below in your reservoir such as counsel have attempted to assume here, or you might. I just want to see.

By Mr. JACKSON. What reservoir?

By Mr. THOMPSON. Radford reservoir, Buck and Byllesby Reservoirs and Bluestone reservoir.

By Mr. JACKSON. There is no suggestion, if it is meant to develop that, that somebody in North Carolina might withhold flow. It couldn't have anything to do with this defendant.

By Mr. THOMPSON. I didn't say anything about withholding flow.

By the COURT. I don't see that it has any applicability to the issues in this case.

By Mr. THOMPSON. Your Honor, we have had this witness testifying to generalities to the extreme. I am now trying to bring it down to the concrete.

By the COURT. All the question implies, or any answer to it would imply, would be that it would be desirable to have a general authority to control the activities on that river.

By Mr. THOMPSON. Am I not permitted to test this witness as to his views, if we are going to have a general authority or separate authorities? To know how we are going to control the flow of the River?

By Mr. JACKSON. I don't see that that has anything to do with this witness' testimony.

By the COURT. It is all so vague, it seems to me, and indefinite. I think that is one of the things that we would generally conclude, that power development on the length of the Kanawha River would probably be more efficiently carried on if every plant were under the control of one central authority to coordinate their activities.

By Mr. **Thompson**. That is just the question I am asking him, and if he will say "yes" to that, I will pass right on.

2537 By the **Court**. I think we can assume that. I think he has said "yes."

A. I don't think that was the question that was asked me. I say, in general, yes, you get more out of a stream if it is all managed intelligently and coordinated.

By Mr. **Thompson**:

Q. And if it were handled that way, that is, by one organization, you would not be liable to have friction, would you?

A. You ought not to. If a man has his own way he ought to get along with himself.

Q. So far as the control of the river is concerned?

A. So far as any business is concerned, control of the river or control of his power plant.

Q. Haven't you known people that had their own way and didn't get along with their own way?

A. I have known people that have had their own way and haven't got along very well.

Q. So that if you had your way about it, you would feel that the control of the creation of power and the operation of plants for creating power on New River, should be under one corporation, wouldn't you say?

A. Not necessarily. It depends on so many circumstances.

By Mr. **Thompson**:

Q. What are those circumstances?

A. Well, we have many rivers developed in Wisconsin where almost every power dam is under the control of a separate corporation that commonly have no relation to each other. I don't ever remember that we had any friction. We are not using the rivers in the most efficient way, however.

Q. In the Brule River that you testified to, that you built a plant on, you had a plant of very small capacity, didn't you?

A. I wouldn't call it a large plant or a very small one. There are many smaller and many larger. It is the only plant on the river, I think, at the present time.

Q. And most of those rivers that you speak of in Wisconsin, like the Brule and others, have only one proposition involved, and that is the question of power?

2538 A. The question of power, and, of course, that includes the question of storage.

Q. Storage and power, but no navigation, for example, on the Brule?

A. No, nothing except row boats.

Q. And you don't have any question of flood control there?

A. Essentially not; not for flood control; no, sir; except for storage, which is always flood control in a way.

Q. And you would not, of course, compare flat lake country conditions in Wisconsin, with conditions in the mountainous section through which the New River flows, would you?

A. I think some of our northern streams are fully as rapid and rugged in places as those in the Virginias. We have a development in one place on the upper peninsula of Michigan of about 600 feet.

Q. Which river is that?

A. I don't know that I can answer that; it is in the upper peninsula.

Q. Is that the Pigeon River?

A. I don't think so. It is a power development that belongs to one of the mining companies there. I have not seen it.

Q. That river is not navigable, is it?

A. None of those, no, sir; except that we are supposed to have navigable streams in the northern section of Wisconsin. This plant is in Pierre du Sac. I have never seen a boat go through it.

Q. You said that you were a partner of Colonel Scheidenhelm and that you had been partners for many, many years?

A. We have been associated in New York.

Q. And you were called in on this project, known as the Hinton project, generally speaking, were you?

A. Do you refer to the Hinton project as the project in West Virginia?

2539 Q. Yes, sir?

A. I never heard it called that, but maybe it is. The Hinton project where the dam—the first dam is about one mile above Hinton and the second about nine miles.

Q. That dam was to be a dam in this system of the Appalachian Electric Power Company, was it?

A. I understood so.

Q. And it was to be operated in its way similar to the Radford project? They were both being built, or were intended to be built, at about the same time, weren't they?

A. I understood so, yes, sir—the Radford proposition first and the others to follow. I never knew how they proposed to carry that out.

Q. This dam—originally you had the idea of building just the one dam at Bluestone or Hinton?

A. I don't know about that.

Q. When you were called in to testify before the Commission in West Virginia, Colonel Scheidenhelm was also called, was he?

A. He was there.

Q. Both of you testified at great length, did you?

A. I answered all the questions asked that I was prepared to. I don't remember now. It has been so long.

Q. He spoke first, didn't he?

A. I don't know about that.

Q. Do you remember whether or not he spoke at great length?

A. I don't remember.

Q. You don't remember that?

A. No, sir.

Q. Do you remember whether or not he outlined the position—the two of you were both representing the West Virginia Power Company, weren't you?

A. I don't remember, but we were representing people that had that interest in the dam. The names are gone from my mind and the details of my testimony are gone.

2540 Q. And you were appearing as an engineer of the firm to describe the situation to the West Virginia Power Commission, weren't you?

A. I could not even say if that was true. I was there as an engineer, but whether or not I was there as part of the firm or not, I don't know. We both made examinations there and gave such information as we had. I don't know that I can carry it any further than that.

Q. Who were you representing there at that time?

A. Well, I don't remember; they were the people that had the interests as to getting the license and the dams in West Virginia. What they called themselves, I don't know.

Q. That West Virginia Power Company you knew was affiliated with the Appalachian Electric Power Company, the defendent here? did you know that?

A. I know that the people that were interested in those two sites were also interested in the Appalachian Electric Power Company, yes, sir.

Q. And it is affiliated or owned and is a subsidiary of the American Gas and Electric Company, isn't it?

A. I don't know. I know they were related.

Q. I am mistaken about that—the Appalachian Electric Power Company, I should have said. I hand you what purports to be a certified copy of the Public Service Commission of West Virginia, by its Secretary Mr. Henderson, being Case No. 1548, West Virginia Power Company, Application for Permit to construct dams on New River for hydro electric purposes, (Blue-

one Project), excerpt from transcript of proceedings and testi-
ony, marked Government's Exhibit 253 for identification, and
k you to look that over and say if this is a report of the hear-
g, which you and Colonel Scheidenhelm attended?

A. (Witness examines record.) It is the same date as I recall.
o what extent shall I examine it?

Q. Just that you recognize it—any of it?

A. I don't believe that I would recognize it but I don't doubt
that it is.

41. Q. May I find the place here for you?

A. Yes, here is the name "Mead" right here [indicating].

Q. There [indicating] is where you began.

A. It seems to be the direct examination. I see my name and
dress and my age and so forth. I presume this is a transcript
the testimony.

By Mr. **Thompson**:

Q. Doctor Mead, when you attended this hearing at Charles-
n, West Virginia, that I have been referring to, did you know
at there was a project being constructed or planned at Number
k site in Virginia, near Pulaski, in Pulaski County, Virginia,
ostream from Radford?

A. At or near Radford?

Q. Yes, sir?

A. I knew that was one of the proposed sites, yes, sir.

Q. Did you know it was to have the general characteristics of
e project at Bluestone?

A. I don't remember very much about the proposed Bull Falls
am or what the storage capacity was. I knew it was a high
am there. I knew considerable about it then, but it has slipped
y mind.

Q. You knew, away back in 1926, that this company, the West
irginia Power Company, had applied for a license from the
tate of West Virginia, for a single reservoir to be located at the
inton site, let's call it?

A. I don't know whether or not I knew it or not, at that time,
don't know. They may have done so. I don't question it, but
hether or not I ever knew it or about the history of it, I don't
now.

Q. Do you recall that there was great complaint that went
o from the Electro-metallurgical Company that waves coming
om the single reservoir would affect navigation below and affect
nditions in the lower part of the river?

A. I don't know that.

By Mr. **Thompson**:

Q. I read you from page 140 of Colonel Scheidenhelm's testimony. Colonel Scheidenhelm was speaking in answer to the question from one of the Commissioners.

2542 "A * * * so that coming back to your point, if there were enough water available, the power system operators would gladly get more than 50,000 kilowatts capacity out of the Bull Falls development during the low water, so that the water that is turned out will not be turned out for any altruistic motive, it will be turned out to generate energy. The load would demand it; it would be economically advantageous to do it. Now, the result of this upstream storage will be to make more water available. The Radford project is to go to construction practically concurrently with the Hinton development, assuming this Commission grants the license. They are economically related as is the Bulls Falls development. Have I made myself clear?

"By Governor Conley. I think so."

Q. (Continuing.) I ask you if you recall that statement being made by your partner, Colonel Scheidenhelm, at the time of the meeting of the Commission?

A. I do not.

Q. Do you agree with what is set forth in that statement?

A. I agree with it, so far as I understand it. It seems to be a little blind—the latter part of it there—if they were "economically related" as is the Bulls Falls development. I suppose they are talking about Bulls Falls and Radford.

Q. Do you recall that you testified about the amendment of your plans down there, which has been for one reservoir and you were now suggesting to the Commission that there were plans and drawings and so forth for two reservoirs, one to be at Bulls Falls, which was to be your peak load reservoir, and a regulating reservoir at Hinton. Do you recall that?

A. I know that was the plan at that time. I don't remember what they were for exactly. I know we were there about getting a license for the company.

Q. I will read here from page 203, and I am reading your testimony.

2543 "Q. What have you to say of the advantage or disadvantages of the proposed structures under the amendment of application of two dams over the original plan of one dam?"

"A. Well, I have been familiar with dams more or less for a great many years over the Ohio and it would occur to me that the principle use of power on West Virginia streams must be for peak power purposes. The single dams from an operating standpoint would hardly be feasible financially. It would bring about such an interruption of flow, variation of flow, high flow and low flow, that it would seriously affect, I think, the operation of navigation in the lower river, whereas, with the plan as now proposed, with re-regulation, both purposes can be exercised in an entirely satisfactory manner. In other words, the upper plane and dip of the peaks, with the regulation of the lower plane, that would take care of the navigation and without injury to the riparian ownerships below the dam. Where a dam or stored water is to be used for several purposes, a re-regulating reservoir is very essential on the project. You asked me about the Boulder Canyon project. The time will come within not very many years when they will have to have a re-regulating dam below the Boulder Dam in order that water may be used for power purposes in lower Colorado and Arizona. The principles are just the same for the successful use of the water in these streams for the purposes for which I see them, and this present proposed proposition seems entirely satisfactory, while I should think the higher dam would be entirely unsatisfactory."

Q. (Continuing.) I am just asking you does that statement express your view.

A. I have no recollection of making a statement in that form.

Q. You have no recollection of it?

A. I don't remember. I don't understand the reference to Boulder Dam. We were anticipating the construction of a dam at Parker to take care of the Los Angeles supply, such
2544 dams as were necessary to—not to re-regulate but to divert
the water to the points to be used. I don't know why I should apply re-regulation of the Boulder Dam itself. This matter in regard to the use of this dam—a re-regulating dam would adjust conditions of operation, which otherwise would have to be adjusted by station operation, which would be less desirable. I don't know whether there is anything in here that I cannot agree to at the present time. A dam built at that point might possibly be operated so as to modify the flow for use—with extreme conditions of peak. This was an advantage—I don't remember off-hand the capacity of this dam at present. That would have something to do with it. Was that about 50,000 kilowatts—it must have been more than that?

Q. No, sir; Bulls Falls is approximately as large as Radford.

A. Or larger?

Q. A little larger, and you had re-settlement of the lower dams—it would not be as much. You don't say that you did not say that, do you?

A. No, sir; I presume I did, although in a case of that kind, there are other conditions beside the one in any direct statement. It is hard to take a direct statement and say why it was made, without knowing the entire conditions that existed and on which the statement was based.

Q. Would you care to read the rest of your testimony?

A. If there are any other conditions other than those which were expressed there.

Q. I would be glad to have you read it over.

A. I don't think I have time to read that big volume.

Q. You didn't say so much. It is in very big type and you can scan over it quickly.

A. (The witness examines record.) I think I have covered that. There are some things here I didn't say. It is mixed up.

Q. To refresh your memory, you were there to advocate two reservoirs instead of one, were you?

2545 A. I was there to give evidence about the character of the proposed work to be done, if the license were granted.

Q. You said, in substance, before that Commission, if they had one project, with the high dam at Bluestone, and ran it at peak load operation it would be serious and dangerous for navigation down below?

A. Not dangerous. I think I said it would probably interfere.

Q. With navigation down below. You said, didn't you, that, it would seriously affect the operation of navigation in the river below?

A. I presume so, if it is there.

Q. Now, did you say that in this last statement that I have just read to you from page 203, and by that, I don't mean the sentence, but the entire statement—do you say you did not make that statement before the Commission?

A. What is the statement you refer to? Let me see it. You mean the full statement?

Q. Yes, the full statement.

A. No, I said if it is here, I presume I did.

Q. It is on page 203.

A. (The witness examines statement.) Well, it is mixed up. There are some things in there I didn't say.

Q. Start with the words "In other words."

A. (Witness reading.) "In other words, the upper plane and dip of the peaks, with the regulation of the lower plane, that would take care of the navigation and without injury to the riparian ownerships below the dam." I don't know what that means.

Q. If you take care of the peaks, and so forth?

A. By re-regulation.

Q. Isn't that clear?

A. (Reading.) "The dip of the peaks," which means that by regulating the peak flows, that you get better results. It is poorly expressed. I did not use these terms, I don't think, but the idea is, as I get it, undoubtedly it is essentially as stated.

2546 Q. You also said that without re-regulation of the dams—the operating of this project as a single project with peak loads, it would seriously affect navigation below, did you?

A. Essentially, that is, I think, essentially that is the statement there.

By Mr. THOMPSON:

Q. Doctor, I want to call your attention to statement on page 227 of the hearing before the Public Service Commission of West Virginia, Case No. 1548, West Virginia Power Company, Application for Permit to construct dams on New River for hydro-electric purposes; being Government Exhibit No. 253, marked for identification. This is cross-examination, Doctor. It says:

"Q. Professor, you have spoken of the control of the stream flow by the Hinton Dam, its relation to floods and its effect upon navigation in the Kanawha River. I want to ask if this control would result from the normal operation of the power plant, or would the operation have to be supervised to bring about that result?

"A. I don't think so; I think it would be supervised, if it brought about any other result but I take it the Hinton plant and power plant would be operated pretty close to 100 percent load factor; that is a continuous load which the power dams could develop, and the Bull Falls Dam would be peak load plant, that would fill up the pond after it had been drawn down by the continuous operation of the lower plant. That is my conception of the operation."

Did you make that statement in that hearing?

A. If it is there, I expect I made it. I do not recall the statement.

Q. Do you adhere to that statement?

A. I think that is substantially correct.

The COURT. When was this hearing?

A. September 1930.

By Mr. THOMPSON:

Q. The 30th day of September, 1930, your Honor.

By Mr. **Thompson**:

Q. I refer you to this same record, page 127, in which Mr. Schiedenhelm is asked to describe the method of operating the dams in generating plants:

2547 "Q. Please describe the method of operating dams in generating plants?

"A. That may involve to some degree repetition of what is contained in Amendment of Application on my earlier statement. The function of the down-stream development is to turn out water in a re-regulated or relatively equalized manner. The need for it arises from the plan of operating the up-stream of Bull Falls development in such a way as to carry peak loads. The carrying of peak loads is an economic necessity. That is the project cannot be justified unless it does that. By the carrying of peak loads means the operation of a power station intermittently or at least with great variation, as compared with what we style a base load or uniformly operated power station."

Do you agree with that statement?

A. I think so. I do not see anything different.

Q. That, then, is your understanding of the operation of a peak load project?

A. In general, I think so.

Q. Continuing on page 128:

"The Bull Falls power station can be expected to operate during the hours of maximum demand upon the power system into which it is to feed practically those hours or the daylight hours, the working days, outside of those hours, perhaps, even during the noon hour, the output of power from the Bull Falls Station will be curtailed or even cut down to zero. That means the outflow areas, but that intermittent output from the Bull Falls development will empty directly into the reservoir of Hinton development. In the Hinton development that water will be reregulated. That is, although there will be a varying quantity put into the reservoir, the output will be relatively regular and uniform compared with the input. It is a necessary character-
istic, as I believe I pointed out, that the downstream res-
2548 ervoir, reregulating reservoir, shall have sufficient storage
capacity to allow for the accomplishment of that result.
It does have that necessity. In brief, then, the method of operating the project will be to operate the Bull Falls development intermittently as a peak load carrier, and the downstream plant, that is the Hinton power station, with relative uniformity."

Do you agree with that statement?

A. I do not see any point in it that I do not agree with it. I think it is essentially correct. It is not my language or my statement.

Q. No, that is Col. Scheidenhelm's.

A. Yes, I understand.

Q. Reading from page 138 of Mr. Scheidenhelm's testimony:

"Q. I still don't catch your idea, Colonel. Do you mean to say that if the water is not necessary to carry the peak load that you would let the water down through the dam during the dry period in order to keep the normal flow going?

"A. That might be the case, and the power company might be altruistic enough for that, but the fact is there is a need for the peak load and the operators of the power system would only be too glad if they had more water available. They are limited by the available water.

"Q. That would depend on the demand for power, wouldn't it?

"A. But that cannot be conceived, reasonably, even in times of business depression, not to require all the output possible."

Do you agree with that statement?

A. Well, I did not get it very clear. It seems to be an extract. I think it is essentially correct, if I get the meaning of it.

Q. Do you understand, Doctor, that there is, even in the most depressing times, a sufficient demand for hydro-electric power on the New and Kanawha Rivers to call for and consume all of that hydroelectric power?

A. I understand so. yes.

2549 By Mr. **Thompson**:

Q. You were present with Col. Scheidenhelm when he testified, were you not?

A. I don't remember. I was a part of the time. Whether I was there during all his testimony, I do not know.

2550 By Mr. **Thompson**:

Q. I want to read you from page 107. This is Col. Scheidenhelm speaking. It is by Commissioner Mahood.

"Q. What have you to say to the advantages or the disadvantages of the amended application of two dams over the original plan with one dam?

"A. The following considerations appear to me to be outstanding and they are all advantages in favor of the change from one dam scheme to a two dam scheme of development. First, the Bluestone project in its original form would have been economically feasible only after reliable examination; that is, after reliable examination for carrying big peak loads. Of necessity this would have resulted in greatly fluctuating stream flow in New River down-stream from the power site. and in particular from the power site and the junction of New River with Gauley River or, in other words, the head of navigation on the Kanawha River."

Do you agree with that statement?

A. I am sure you will have to let me see that to get it through my head, just what the statement is.

Q. Starting right there and going over here (handing witness record).

A. In answer to that, I would have to say this: Col. Scheidenhelm has gone very much more into the study of these various proposition than I. Some of things he said I could not substantiate because I have not gone into them. I do not doubt but what that is essentially correct, as near as I know, but I do not pretend to know as much about it as the Colonel, because it was under his immediate charge, and I was looking into general phases. I would not like to substantiate everything that is said there. Some of it I have no knowledge of at all. He has the knowledge, and I have no doubt that he is correct. I could not say I know it all. He had it under his immediate charge.

Q. Hadn't you made a study of this situation before you went before that Commission?

A. I studied certain phases of it before I gave evidence.

2551 Q. You gave evidence with respect to the peak loads and the operations down the river?

A. I think you read it this morning and I stated it.

Q. Let me read you [continuing on page 108]: "Secondly, it is believed by me, from the standpoints both of downstream riparian owners and water power developments, and also of the best interests of navigation on the Kanawha River, the applicant power company would not be justified in taking the risks of constructing or attempting to construct the original single stage Bluestone project, with its 140 feet dam at the Hinton site, inasmuch as that dam and power station, and in particular the operation of the power station, would be dependent upon the legal right and the practical ability to operate that power station primarily for carrying peak loads. The carrying of the peak loads means fluctuating output from the power station. In other words, variation in stream flow downstream from the power site." Do you agree with that statement?

A. As far as I know. I never made any study of the economics of this construction.

Q. Well, isn't this more than economics?

A. It is variation in flow and its possible legal effect on investment, I should take it. It sounds very reasonable, and I think it is correct, but you are asking me to confirm a lot of things I never stated, and I would like to have my position clear on it.

By Mr. **Thompson**:

Q. Let me ask you about a statement on page 109.

Mr. **Jackson**. A statement by whom?

Mr. **Thompson**. Col. Scheidenhelm.

By Mr. **Thompson**. "Thirdly, under the present scheme of development, which is the scheme proposed in the Amendment of Application, such peak load operation, with extreme variation in water output from the power station, can be carried on to the maximum practical degree at the upstream or Bull 2552 Falls development without any resistant interference with the rights of riparian owners or with navigation or the navigable capacity of the Kanawha River. The operation of the Hinton development will be subject to the necessity of reregulating the discharge of water from the Bull Falls development, and it has the function of operating and will be operated so as not to interfere substantially with navigation on the Kanawha River or with the rights of downstream riparian owners." I assume you agree with that statement, don't you?

A. Yes; I agree with that.

Q. Now, on page 685, Mr. Scheidenhelm has been recalled, and Commissioner Nethken is examining him: "When you speak of Hinton and Bluestone, you are referring to the same development?

"A. I should not have used those words, if I did.

"Q. When you referred to Bluestone, what did you mean?

"A. When I referred to the Bluestone project I intended to refer to the combination of the two developments. That is a sort of a preamble to the explanation of the fact that this hydroelectric development will not always have available to it the water to meet the demands up to the capacity of the machinery. Now, in the two developments or power developments of the Bluestone project, it is proposed to install a total of 142,500 kilowatts; out of that total, in the neighborhood of one-half, in fact, less than one-half, or approximately 52,000 kilowatts of capacity would be available even during the low water year. Let us say 1925, which is our practical measuring stick, for that purpose, and that capacity would have been available not for all the time throughout that low-water season, but only the basis of 25 percent load factor, that is throughout that low-water period, utilizing all the available storage of the Bull Falls reservoir, that capacity of 52,000 kilowatts could have operated reasonably only 25 percent of the time. Naturally that is for the best interests of the power company, but it is in- 2553 tended to feed that 25 percent of the time, which would be allocated to the periods of maximum low demands. It is the equivalent of six hours per day. Practically, I think it would result in operating for five days of the typical low-water season week, over a length of time in excess of six hours, and operating on Saturdays for a longer time than six hours and probably on Sundays not at all, so far as concerns the Bull Falls development, while the Hinton development is going along with comparative regularity, with this total of 52,000 kilowatts." Do you agree with what is contained in that statement?

Mr. JACKSON. I object to that as a statement of fact.

The COURT. You may answer.

Mr. JACKSON. Exception.

By Mr. THOMPSON:

Q. Is that the proposed method of operation?

A. I assume it was if Col. Scheidenhelm said so. I do not see anything there I differ with. I have not made study enough of the hydrographs of the low year to know whether it is just 25 percent or what, but I should judge that it is practically correct, and I think it is fully correct if that is the Colonel's testimony because he had made a thorough study of it.

Q. Doctor, you testified Friday with respect to silt in the Radford project, and, as I recall it, that the silt that might come down that stream would be caught in and held in the Radford project, except a very small amount which would go over the dam or be carried down the river. Is that substantially what you testified?

A. Substantially so; yes.

Q. Now, do you know where the Washington Mills reservoir is?

A. No; I do not.

Q. Upstream?

A. Is that upstream?

Q. Yes; it is up above the Buck and Byllesby.

A. No; I don't recall that. I know that there are some up there.

Q. Do you know how old that dam is?

A. No; I do not.

Q. Do you know the depth of silt as testified to in that 2554 reservoir by Dr. Barnes?

A. I heard your statement this morning. That is the only way I know.

Q. He testified on page 3889 that that dam, which is 33½ years old, has now a silt capacity in it of 80 percent. I call your attention also the fact——

A. (Interposing.) A silt capacity of 80 percent?

Q. Probably the word "capacity" is not the right word—silt deposit?

A. 80 percent of its capacity is filled up?

Q. Yes; that is right. He also testified that the Byllesby dam and the Buck dam are both 23⅔ years old, and that the Byllesby reservoir is silted to the extent of approximately 60 percent.

A. Is that the lower dam?

Q. That is the upper. Then the lower dam, which is the Buck, being of the same age, is silted to the extent of 20 percent?

A. Yes.

By Mr. **Thompson**:

Q. When a reservoir fills with silt, that destroys what we call channel storage to the extent that it is filled with silt, does it not?

A. I could not agree with your terms. I would not call it "channel storage." It is reservoir storage.

Q. Maybe I am, in my layman ignorance, incorrect, and I accept your statement.

Q. In other words it does destroy, what did you call it——

A. The reservoir storage.

Q. It does destroy the reservoir storage?

A. If it occurs in the area of the usable storage; if it gets into the bottom where we don't expect to use it, it don't do any harm whatever.

2555 Q. If you had that occur in a number of reservoirs on a river it to that extent might be serious at flood times, might it not?

A. I don't see just how.

2556 Q. Supposing Boulder Dam fills up with silt, will the problem of flood waters be any more serious than if you didn't have Boulder Dam there?

A. That is a pretty large question.

A. I don't see that it would.

Q. Wouldn't the water come rushing down there and spill over the dam without any chance for reservoir control?

A. Well it would have to cover the reservoir surface. If it was full of silt it would cover over the silt surface until it would come high enough to go over the spillways.

Q. And in Boulder Dam you have what is called a "box canyon" and that would easily happen if your reservoir were filled, the water would rise very high and go over the dam?

A. It would rise and go over the spillway if the reservoir were full of silt.

Q. Wouldn't you have a more serious problem with flood control than if the Radford project was not there at all?

A. I can't say you would.

Q. Wouldn't your storage capacity be gone if the dam was filled with silt, wouldn't your channel storage capacity be gone?

A. Your reservoir storage capacity would be gone, but if you had that reservoir filled with silt and the flood come down it would necessarily spread out over that whole reservoir and begin flowing over the dam.

Q. Whereas, if you didn't have it filled with silt you would have some opportunity, would you not, to catch the water in the reservoir and hold it back?

2557 A. That is what the reservoir is for, and it certainly would. The question you asked is so complicated it is hard to see its meaning or give you a definite answer in regard to its effect.

Q. Let us take the Bluestone reservoir. You recall, do you not, that one of the requirements of the Bluestone reservoir was that it should have a minimum discharge in low-water times of 2,000 second-feet?

A. I think I heard that; yes.

Q. And also one of the purposes of the dam was flood control?

A. Yes; I understood that.

Q. And there was also another purpose, and that was a usable storage for the creation of power?

A. Yes, sir.

Q. And I suppose also for navigation purposes, that is usable storage would naturally go down the river and would affect navigation, would it not?

A. I would consider it so.

Q. If the Bluestone were seeking to maintain its head there for the creation of power by keeping the usable storage part of it filled, and a flow came down from the Radford project, under such a condition would not the Bluestone have to let that water go through or else preempty some of its surcharge or flood storage?

Q. We will assume the Bluestone was not discharging any water for the purpose of creating power?

A. It would have to be used, stored, or wasted.

Q. If it were stored it would begin to occupy the space allowed for the surcharge of flood storage?

A. If the lower space were filled; yes, sir (R. 6083–6087).

Q. Let us assume that under the 308 report 2,000 second-feet are being discharged by the Bluestone and the Government is maintaining, or seeking to maintain, its usable storage capacity, and it has a surcharge storage above that for storms or high water if a flood comes down the river from the Radford project of 9,000 second-feet, will not the Bluestone have to 2558 take care of that 9,000 second-feet in the surcharge or flood part of the dam or else let it go through?

A. It either has to be stored, wasted, or used.

Q. Let it go through, I don't mean wasted?

A. Let it go through, that is what you mean by wasting it. I take it the very purpose of that upper part is to store floods and prevent damage downstream, and I don't understand why a flood of that nature wouldn't be regulated in the upper reservoir. That is what it is for, isn't it?

Q. But the Government is standing there, as I understand it, with an insurance to protect the situation down below, so that if a great storm comes rushing down they will have a storage capacity under the surcharge to take care of it; therefore, it is the Government's purpose to keep that surcharge in the clear all the time.

A. And not use it when needed?

Q. Have it always ready for storm conditions?

A. That is a distinction I can't quite comprehend.

Q. Supposing that they let that surcharge get filled with water?

A. Why should they let it get filled with water, they would use it to regulate with, wouldn't they; that is what it is for?

Q. It is to regulate flood control?

A. Any water that comes down the stream is a part of flood control, isn't it? It isn't labeled rainfall or flood.

Q. I understand there are certain flows described in the 308 report which under certain conditions this surcharge would have to take care of?

A. I understand it is to take care of any increase in flow that needed regulating.

Q. Your answer is that water would either have to be taken care of in the surcharge part of the reservoir or it would have to go through?

A. Under your assumption; yes, sir.

Q. If it went through, wouldn't it create a wave the same as if there hadn't been a reservoir there?

2559 A. I don't suppose it would differ very much from one that would go down the stream from away up above if the reservoir had not been built. A diminishing flow always occurs down the channel, and it would diminish in this reservoir, the amount that started over would be small at first, and as the reservoir fell it would increase.

Q. Do you know what the capacity of the gates at Bluestone are?

A. I don't recall them. I suppose for about the maximum flood.

Q. You do understand, do you not, the Bluestone cannot take care of all the run-off of the watershed above it?

A. It is limited of course to its storage capacity.

Q. Which is not sufficient to take care of it all?

A. I don't know if that is true or not. I assume it is. I wouldn't think it would be sufficient to take care of the total capacity of a large flood.

Q. It isn't sufficient to regulate the flow of the New River?

A. I wouldn't imagine it would be.

By the COURT. Is there any reason why you can't completely regulate the flow excepting at such periods as the natural flow rises above 11,000 cubic feet?

A. The natural flow at times of flood, as I recall it, sometimes runs up as high as 75,000 second-feet, and the floods long continued I should not think 235,000 acre-feet would be sufficient to smooth that out so you could make a normal or uniform discharge. I should think it would take a number of times that capacity, your Honor.

Q. Doctor, you said that in estimating the necessities for a reservoir such as the Radford reservoir, I believe you allowed for a capacity much larger than the largest flood record, is that right?

2560 A. I don't get that question.

(Question read.)

Q. I should have said the discharge, you make an allowance for much larger flow than would have to be taken care of in the highest flood condition you know of?

A. We commonly use the factor of safety. I mean by that, we provide for a flow greater than has ever occurred because of anticipating an excessive flo'd sometime in the future.

Q. And in your Radford project you did allow for that very much larger discharge?

A. I have no doubt we did, because we never do otherwise. I don't remember the details of that, though. I know well enough that it was done, but just how it was done or what allowance was made, I don't remember. I don't know that I ever knew.

Q. Also with respect to the average flow under minimum conditions such as, I think, you have fixed at 1,200 second-feet, you allow for the lowest years that you know about?

A. Yes.

Q. Isn't it possible, Doctor, for a drier period to occur than has ever occurred before?

A. Yes.

Q. So that it is possible to expect an even less run-off than we had in 1925 and 1930?

A. Yes.

Q. Why is it that the defendant here, did not figure a possibility of that kind; as I understand it, in fixing this average flow, you fixed it on the basis of the lowest flow of 1925 and '30?

A. I think I stated in my direct testimony that it would be the part of wisdom to keep somewhat below that in order to provide for a contingency of an extraordinary year. That is, the aim of our experience, that we must not be above that. How much below it would depend on how extreme the low years have been. If we thoroughly believed they never could be exceeded as a minimum we would work right up to it. If we had limited experience and were quite confident that at some time it would be much less we would keep considerably down from it. 2561

Q. The thing that has struck me, if I may suggest it to you, is that the engineers figure on something much higher in the way of floods than has ever occurred but they don't figure apparently on something much lower than the dry periods have shown?

A. I think they do. I think they try to provide for it in the way I suggested. The extreme of the flood is likely to be so much more severe in its effects, so much more serious, that we probably give that greater attention on that account. If you double the floods it might be a very serious thing.

Q. Floods have been on the increase, haven't they, from time to time?

A. I don't think so. I don't think they are any greater than they always have been for the last thousand years.

Q. When did you learn about this rule curve of 1,200 second-feet?

A. I don't know what you mean by rule curve.

Q. I don't know either, but I understand that is what counsel likes to call it.

A. I don't know. From what I have heard about it, it is a thing that we figure out very often. We make a hydrograph that shows the low-water conditions, and how it sinks below the level of the common discharge and the amount that sinks down gives a study of the reservoir capacity we have got to have and what the minimum flow would be under those special conditions and from it we can also judge if the conditions were greater, more serious, what effect that would have.

Q. Did you accept from Mr. Scheidenhelm, or whoever informed you, this figure of 1,200 second-feet?

A. Well, I saw the curves on which they were based, both the curves of '25 and the curves of '30. I didn't check them up in detail, if that is what you mean, I didn't check them up.

2562 Q. Those curves, as applied in a practical way, to this 1,200 second-feet, would require you to know the capacity of the reservoir, would they not.

A. Well, to determine the quantity of low-water flow you would have to know the capacity of your reservoir, or, on the other hand, in order to determine the capacity of the reservoir you needed, you would take that from the same study.

Q. Has anybody ever given you the actual capacity of the Radford Reservoir?

A. I don't suppose the actual capacity of any reservoir is known except approximately.

Q. That may be, but I mean the capacity that the defendent is proceeding on?

A. The capacity that I referred to is the capacity for utilizable storage and that has been determined, as I understand, by surveys which show it at 100,000 acre-feet. I didn't make those surveys and I don't know whether that is true or not, except that I accept the Colonel's statement.

Q. In other words, you have never seen drawings which show the actual area of that reservoir, have you?

A. Well, I don't know how a drawing could show the actual capacity of a reservoir. I have seen the capacity curve that shows the capacity of that reservoir to be 100,000 acre-feet.

Q. Have you ever seen topographic maps of the base or surface of that reservoir?

A. I don't recall whether I have or not.

Q. You don't know whether they are in existence or not?

A. Well, I have seen some maps of the reservoir, but whether they are what you have reference to or not, I haven't any idea.

Q. Were they completed maps or where did you see them?

A. Well, I saw them in the field and in the office. They were completed as far as the work we were using them for at the time was concerned.

2563 Q. Whose office did you see them in?

A. The New York office. I think we studied them there. I think we studied them in an office down in the field. I don't remember just what little place it was. It was up at the Crossroads.

Q. Do you remember when you saw them?

A. No.

Q. Would it be three weeks ago or a month ago, would you say?

A. A year or two; two or three years ago, I would say. It was at the time the investigations were being made for a dam site and to determine the tightness of the reservoir and other matters of that sort.

By Mr. THOMPSON:

Q. Doctor, you estimated, I believe or figured on the basis of an average minimum flow of 1,200 second-feet from the Radford project; is that not correct?

A. I estimated from the curves that I have that the maximum average flow through the extreme dry season would not exceed 1,200 second-feet.

Q. And that curve was supplied you, as I understand it, by somebody else?

A. Yes.

Q. I notice all the way through in your testimony you emphasize the word "average" and, as I understand that use of the word, that would permit the company for part of a day, let us say, or part of two days—I think you went as far as two days—to drop below the 1,200 second-feet and at other times to go above 1,200 second-feet. Am I correct in that understanding?

A. Yes; I think so, in a way. Of course, the 1,200 second-feet is what would normally be added to the dry-weather flow. No; I am mistaken about that. I mean you would add enough to the dry-weather flow to bring it up to approximately 1,200 second-feet. You might choose that one hour four times or five times or six times. That average would be over 24 hours, and in ten or twelve hours you might not use it at all, but the
2564 average use during any particular period ought not to
exceed 1,200 second-feet, and it preferably should be kept below that for the reason I have already explained.

Q. So that you could close down, as you say, for from 10 to 12 hours at a time and still keep that average?

A. Yes.

Q. And you could flow the stream or discharge up as high as 9,000 second-feet, could you not?

A. Yes; with a full reservoir.

Q. Next Monday is Labor Day. Couldn't you shut-down from Friday night until Tuesday morning?

A. I suppose you could shut-down indefinitely if you wanted to, if there is any occasion to. You wouldn't expect to do a thing of that sort in any reasonable operation of the plant.

Q. That is just what I want to talk to you about for a moment. You are a thoroughly experienced engineer and we all acknowledge it. Aren't there reservoirs that do close down from unexpected reasons for quite long periods of time in systems like the Appalachian?

A. Well, that is a pretty broad question. I wouldn't want to answer it either yes or no. Of course, we build reservoirs and close them down entirely and collect all the water that flows for irrigation purposes.

Q. That is a different situation.

A. Yes; that is quite different.

Q. But I am thinking now in terms of power projects.

A. As a rule, we do not shut-down a reservoir that is used for power purposes in this eastern country entirely; that is, we always expect to let the normal low-water flow proceed. The general proposition is that our reservoirs uniformly are to take off the peak, maintain the low-water flow which ordinarily we don't consider that we have any business to stop.

2565 Q. Didn't it occur on quite a few occasions—I wouldn't say often—but quite a few occasions during what we call the panic period when there was such a low demand for power that some of these reservoirs were closed down?

By Mr. Jackson. In low-water periods?

By Mr. Thompson. In low-water periods.

A. Well, I couldn't say about that. I don't keep posted on all the reservoirs in the country.

Q. Do you know the Martin Dam in the Alabama Power Company system?

A. No; I only know concerning that system in a very general way. I don't know about the storage.

Q. You don't know that that dam was closed down for 84 days at one period?

A. No; I don't know anything about it.

By Mr. Jackson. During low water?

By Mr. Thompson. During low-water period.

By Mr. Thompson:

Q. And you don't know that it has been closed down on thirty different occasions from five to seventeen days?

A. I don't know anything about it, so most any question you can ask me I don't know.

Q. I don't want to go beyond what you know about it?

A. I don't even know where it is.

Q. In your dams up in Wisconsin, they do close down from time to time, don't they—up on the Brule?

A. Our plants?

Q. I should say plants.

A. I am trying to think of any time they have been closed entirely. I don't know of any.

Q. Wasn't the Brule dam closed down in 1930?

A. It might have been. I don't know. I doubt if I knew much about it at that time. The company had sold that plant, I think, to the North American Company some years earlier than that, and I think the records of operation were sent to our office and we were advising them for some years. I don't know whether we do yet or not.

Q. You look after the western business of your firm, don't you?

A. Well, yes and no. I have some work that is done in connection with Colonel Scheidenhelm and some that has 2566 been done in the past with my associate, Mr. Seastone, and some I have done individually.

Q. You wouldn't say that none of those reservoirs that are under your jurisdiction out west were not closed down for quite a period of time, let us say several days or as high as two weeks during 1933?

By Mr. Jackson. Low water?

By Mr. Thompson. In low-water times.

A. I don't know any reservoir that would be closed down except the reservoirs on the head waters and they are closed down at all times except when more water is needed.

Q. In other words, they are storage?

A. They are storage reservoirs, built at the headwaters and owned by the combined water power interests on the stream and opened up only as the water is needed.

Q. Are any of those power reservoirs?

A. No; those are not power reservoirs. They are simply storage reservoirs, very much like those at the head of the Mississippi.

Q. I have here Defendant's Exhibit 594, which shows the Radford curve as applied to the system of the Appalachian, and ask you if that doesn't show a variation from zero to 9,000 second-feet?

A. It does.

Q. I was also interested in your qualifying language in answer to counsel, in which, talking about the 1,200 second-foot phase of the question—I am reading from page 5966:

"A. With a full reservoir there would be some very slight draft in June. I am supposing, if intelligently used, there would have been some slight draft in June."

I noticed that you made that qualification all the time. Aren't there times when reservoirs are not intelligently used? Human beings make mistakes, do they not?

A. I suppose that may occasionally occur.

Q. On Page 5967, you said:

"By Mr. **Jackson**. Not more than 1,200 [meaning, I presume, second-feet].

"Q. Under that method of operation, would the storage be exhausted at any time prior to the end of the low water season?

2567 "A. Not unless—I don't know that it ever gets so low so you can't find some time it might go lower and therefore you should cut under 1,200 feet. It may occur."

And you left there a reservation that such a condition might occur, didn't you?

A. Yes.

Q. There might be such a condition arise?

A. Yes.

Q. Then you said on the same page:

"Q. You said in the first part of your answer, assuming at the commencement of the low-water season the reservoir was full; please state whether, in your opinion, under proper operation, the Radford reservoir would have been full at the commencement of the low-water season early in June?

"A. Under proper operation it certainly should have been filled and practically full at the time of the low-water season."

You have the assumption there of the proper operation of this project and might not one man's judgment differ with another as to proper operation?

A. Not radically. The principles of operating a reservoir are so nearly fixed that there couldn't be very much divergence or difference of opinion on that subject.

Q. And then turning over to 5968, you said:

"Q. Would you consider it a reasonable or an unreasonable method of operation, if, under conditions disclosed in 1930, the utilizable storage of the reservoir had been depleted or exhausted prior to June 22nd or 23rd 1930?

"A. I should consider it an inexcusable blunder.

"Q. Are you familiar with the load requirements of the system of the Appalachian Electric Power Company?

"A. No; I don't know anything about it except in the way as I have stated of load curves in pretty near all the country in the main plants. I do not recall that particular load curve. I may have seen it and presume I have."

2568 Are you familiar with the report that Major General Taylor wrote to the Federal Power Commission in 1925, December 29th, in which he said that this Radford reservoir could be closed down indefinitely insofar as navigation down below in the Kanawha was concerned? Are you familiar with that?

A. I don't recall it. I may have seen it, but I don't recall the particular report.

Q. You regarded General Taylor as a distinguished engineer, did you not?

A. I don't know. Was he Chief of Engineers at one time?

Q. Yes.

A. I have only known him in a general way. I have known many of the Army Engineers and they are very able men, all that I have known.

Q. If he had said that the reservoir could be closed down indefinitely, then if it was to the benefit of the power company to close it down for any reasons, accident, mood of some person, or demand of the directors, that could have been done, could it not?

A. I suppose it is physically possible.

Q. But you don't think that that would be probable?

A. I can't see any reason for doing it. I think it would be a very peculiar condition that would bring about anything of that sort. I can't see any reason.

Q. You would admit, would you not, that it could be closed down indefinitely?

A. Well, it has to be made so it can be closed off, as far as that is concerned.

Q. Are you familiar with the license that the State of Virginia has granted to the defendant?

A. No.

Q. Did you ever hear of the license?

A. Yes; I heard there was a license but I never read it.

Q. Are you not familiar with that?

A. No; I am not. I knew there was a limit fixed of some kind but what it was I haven't inquired.

2569 By Mr. THOMPSON:

Q. I am reading again from General Taylor's report of December 29, 1925, that paragraph which I have already read: "It may be assumed as a possibility that the plant might be closed down completely for an indefinite period of time during a dry season and at a time when the storage above the dam had been drawn down."

Now, Doctor, I am asking you if you consider that is a possibility?

A. I do not.

Q. So that you don't agree with him there?

A. No.

Q. Second: "In the event of such a combination of circumstances, all water from the drainage area above the dam would be shut-off until the reservoir filled or until operations were resumed." Do you agree with that statement?

A. If what he says is conceivable, that would follow; I would agree that far, yes, sir.

Q. And now this—this is next to the last paragraph (reading). "Therefore, so far as can be predicted from available data and records it would not be possible to operate the proposed project so as to adversely affect navigation on the Kanawha River under the existing project."

By the COURT. The paragraph read to the witness indicates they are somewhat contradictory, some of them. One of recites the possible shutting off of the water and immediately jumps to the conclusion that that would not affect navigation. There is an intervening paragraph.

By Mr. THOMPSON:

Q. This is the paragraph alluded to (reading):

"The drainage area above Dam No. 2, the upper dam in the Kanawha River, is 8,470 square miles. The drainage area above the site of the proposed dam is 2,396 square miles. The 2570 drainage area between the proposed dam and Dam No. 2 is therefore 6,074 square miles. Records of the measured flow for the years 1909-1916 are available for streams which drain a total of 3,714 square miles of this intermediate area. From these records the total flow of the drainage area below the proposed dam has been computed for each month of the years for which records are available. It is found from these computations that the run-off from this drainage area below the proposed dam is sufficient to supply the necessary water for navigation on the Kanawha River under the existing project."

By Mr. THOMPSON. Then comes the last paragraph. [Reading:]

"Therefore, so far as can be predicted from available data and records, it would not be possible to operate the proposed project so as to adversely affect navigation on the Kanawha River under the existing project."

By Mr. THOMPSON:

Q. (Continuing.) That was written in 1925, before any new dams were constructed. Do you agree with that statement?

A. Assuming that each of the preceding conclusions is correct, that conclusion would follow. I would agree, if the statement is correct, which I have no doubt it is, that the conclusions are correct also.

By Mr. **Thompson**:

Q. Assuming an allowance of 250 second-feet by the Government to the Kanawha Valley Power Company, for lockage, at the Marmet and London dams—on each dam—assuming the flow of the river at Kanawha Falls on October 7th and 8th, 1930, to be 800 second-feet—860 second-feet—allowing for the time of travel of the corresponding flow at Radford dam site, October 3rd and 4th, to be 620 second-feet, would you—and that was October 3rd and 4th, would you, if you had control of navigation on the Kanawha River, with the London and Marmet dams in existence, have permitted, for the dates of October 7th and 8th—excuse me—for October 3rd and 4th, a cutting off of the flow of New River at Radford?

By Mr. **Jackson**. We object to the question, because that part of the hypothesis or assumption, that the Government reserved 250 second-feet, has no significance; and even stated hypothetically, it calls for the interpretation of the contract, and this is not a proper subject for the cross-examination of an engineering expert. Also because—we object further because it does not say whether or not the wicket dams in Kanawha River below Marmet have been removed, and whether or not Winfield and Gallipolis are in operation.

By Mr. **Thompson**. That is not pertinent in any respect, as counsel well knows. We are assuming conditions only with respect to London and Marmet and the question went to London and Marmet dams.

By the **Court**. Read the question.

(The question is read.)

By the **Court**. What was it at Kanawha Falls?

By Mr. **Thompson**. It was 860 at Kanawha Falls and 620 at Radford.

By Mr. **Jackson**. I would like to add to my objection that the first assumption is entirely based on some supposed contract right, and any assumption along that line would have to be an assumption of the lockage requirements that were on the river, at that time. It does not matter what the contract says.

By the **Court**. Wasn't that the same question that you asked this witness or some other witness.

By Mr. **Jackson**. No, sir. I asked a question, assuming what the requirements of the locks were. I did not ask him—assuming that there was a contract, but a certain amount for lockage, what would you have done, and what would have been the effect. I did not ask what would be done but I asked the effect. They have, instead of that, asked him assuming some contract. They have asked him, instead of his assuming what the lockage requirements were, they have asked him to assume that there was a certain contract.

By the COURT. He said "assuming" the allowance of 250 second-feet, whether or not by law or in fact—that is the foundation for the question. Assuming the requirement of 250 second-feet for lockage.

By Mr. THOMPSON. No, sir; but assuming an allowance of 250 second-feet for lockage at the two reservoirs.

By Mr. JACKSON. We object, because it should be an assumption of fact or an assumption as to contract rights, one or the other, so that we may know what it is.

By the COURT. Assuming 250 second-feet required for lockage and that the authorities in charge of the Government operations on the Kanawha River proceed on the basis of 250 second-feet—that that is required?

By Mr. THOMPSON. Yes, sir.

By Mr. JACKSON. If your Honor please, I do not wish to be persistent, but the question of whether or not certain water was required, in fact, and the question of whether or not there was some theoretical contract provision for water not needed in fact, would have a bearing on what my course of conduct would be. It seems to me when the question is put in that form and counsel refuses to define it, that it is objectionable.

By the COURT. He may answer it.

To which action of the Court in overruling said objection, counsel for the defendant excepts to the ruling of the Court, for reasons heretofore stated.

A. I understand that there are a great many dates interposed,
and some suppositions—I could not quote them fully—but
2571 I understand that you assume essentially that Kanawha
Falls was 860—yes, sir—second-feet, on that particular
date, and that at a previous date, which would have affected that flow—there was at Radford dam 620 second-feet, and you leave indefinite what, if anything, was coming down New River, except that he expected the 800, on that assumption—that it did affect—or the 860—that involves, as I gather it—if you close the Radford dam under these conditions, you would have 240 second-feet available for navigation purposes.

Q. For lockage?

A. Now, of course, it would depend on two things—as to whether or not that would affect navigation. First, whether or not you would use 240 second-feet, and, in the second place, if you did use more than 240 second-feet, you have storage, as I understand it, at what you call the London dam of 2,700 acre-feet; a three feet draw-down that would supply lockage and leakage for several days. Apparently, there is very little difference between the water available and the assumption that you made as to the use of 250, if that run along many months—that is many days, still the reservoir above London would take care of the lockage and render it unnecessary ~~to get more~~ water down the river.

By Mr. Thompson:

Q. I don't quite get your reply?

A. I might say that you gave several dates, but I think I understand definitely what you ask.

Q. The flow is cut off on the third and 4th. Allowing for the time period for water to travel down the river, which would be the 7th and 8th at Kanawha Falls?

A. You would have 240.

Q. Give it at Kanawha Falls at 860.

A. If you cut off 620, you would have 240?

Q. Yes, sir.

A. Assuming that you use 250, you will have 10 second-feet shy, unless you take it from the London pool. 2572

Q. Assuming for navigation purposes, that the government—that you have a three-foot draw-down at London dam; assuming that they kept the pool filled to the top, doing so with the three-foot draw-down; what would you say as to the necessity for allowing water to come down from the Radford project?

A. You would have ten second-feet short, if your assumption is correct.

Q. You said something very interesting this morning about the conditions of the Charleston water supply. I think you were the witness who said they got their water supply from the Elk River?

A. I mentioned it; yes, sir.

Q. You made a study of that?

A. I made an examination and report to the Commission, at their request.

Q. As I understand you, water was taken from the Elk River, close to its confluence with the New River?

By Mr. Jackson:

With the Kanawha.

Q. Yes, sir; the Kanawha River?

A. Yes, sir.

Q. Yes, sir.

A. It was taken, I don't know—a number of hundred feet up the river, I imagine.

Q. And at a time when the Elk River was practically dry?

A. Practically so, yes, sir; it was very little water.

Q. As a result of the flow, the New River—the flow of the New River, had backed up into the Elk River?

A. The Kanawha River?

Q. Yes, sir.

A. The Kanawha River—the flow was reversed in the Elk and the water flowed to supply the water needed by——

Q. What is that?

A. It reversed the flow in the Elk and water flowed from the Kanawha.

2573 Q. Into the Elk?

A. Yes, sir; to supply water needed for the pumps.

Q. So that, under these conditions, there was a pollution, as I understand it, of the water in the City of Charleston?

A. Yes, sir.

Q. Now, if you were in charge of navigation and the protection of riparian owners along the navigable parts of the Kanawha, under the conditions such as I have described about the flow from Radford, and at Kanawha Falls, would you, if you were in charge and had the final say, want to cut off the flow from Radford under those conditions?

By Mr. Jackson. We object to the question, because it goes to both the question of water supply and to navigation. It cannot possibly and does not have anything to do with water supply.

The objection is overruled and the defendant excepts to the ruling of the Court for reasons stated.

By Mr. Thompson:

Q. Assuming what I have told you.

A. I am trying to get them in mind. It is rather complicated. I should certainly want to see that there was enough water for navigation, I expect.

Q. And you would certainly want to know if there was enough water for riparian owners?

A. Yes, sir; I should assume there was a duty there to be attended to, by myself or someone else.

Q. If you were in charge, would you order the flow from Radford to go down the river—the natural flow of the river?

A. I could not conceive myself that the discharge from Radford would not be coming down the river at this time. You assume conditions that I do not believe practical. I do not think it could possibly occur in any reasonable system of operation. The fact that the reservoir is built to store water at high periods and let it out at low periods, would assure that the water would come down the river.

Q. Didn't you say that you could operate this project so as to cut off the Radford project for a period of eight hours at a time?

A. I think I said two days or a year, then said indefinitely, but that was on a supposition that was untenable. You have got to look at the reservoir for use as a practical proposition. If you are going to assure that, as the owner of the reservoir, I am willing to operate it to try to injure somebody, regardless 2574 of my own interests, I assume we could find somebody that would make the water low in time of low water and high in high water, but if I did that, I would lose my interests.

Q. No, sir. I would not expect you to kill or injure somebody, but you would have a self-interest there, which would be perfectly human and natural, and you would want to push that self-interest just as far as you could. That is, without becoming some outlaw or something of that sort, but in dry times, wouldn't you close down in order to get a head of water on Saturday afternoon, when the dam was off and not open until Monday or Tuesday?

A. I should expect in summer time to have 1,200 second-feet capacity.

Q. Yes, sir. But we come back to the question of average. I cannot get that out of my mind. Do you say this average amount you could cut-off for a couple of days at a time, without allowing the water to go down the river?

A. You could shut-down for a day or two at a time, I presume, without any very serious effect. Of course, in the operation of a plant of that kind, I would doubt if that would be done. I think it would operate certainly continuously for five days a week and I think it would operate to some extent at least on Saturday—I should doubt it, although it might be shut-down for Sunday.

Q. Wouldn't it be perfectly natural to do as General Taylor has said in his letter—in his report—to allow for a flow sufficient below there—from the watershed below there, to take care of the needs down the river, and on that theory, to close down in order to store for a head from Saturday to Monday, and on a Holiday, until Tuesday?

A. I think the General's assumptions are entirely untenable; and I could not conceive of the operation of the plant so as to affect rights below. Any operation—intelligent operation of the plant must consider the interests below—the riparian, navigation, and any other interests downstream; the plant would necessarily be operated so as to take care of those interests, or trouble

would result. When you ask about the physical possibili-
2575 ties of doing foolish things, you can do almost anything
conceivable on suppositions, if you do not care what happens, but intelligent people try to keep out of trouble, and I believe most people who operate hydroelectric plants have reasonable intelligence and they are particularly anxious to keep out of trouble and operate it intelligently and do not try to seek difficulties. I cannot see that this plant could be operated, or would be operated, in any way but along an intelligent line, that would take care of rights down below, navigation, riparian, and water supplies and all, and the water stored during the high state of flow would be used intelligently to increase the flow, both through the plant and through the river, in low-water conditions.

Q. Well, it might increase the average flow, but how about this interim period, where at times you got below the average flow, and then at times you got above the average flow. In other words, your interpretation of the word "average."

A. The average in a day—I was speaking when I referred to that, as the pretty well ironed-out average between Radford and the Falls. These little waves that occurred would be such that when they got to the Falls, they would be apparently uniform.

Q. You have testified as to the type of wave this company would or could use?

A. No, sir; I did not say as to the wave; no, sir.

Q. Defendant's Exhibit 594—that calls for Zero to 9,000 second-feet?

A. That particular——

Q. In a dry period, such as October 1930 or 1925, if you ran this project on a peak load basis, 9,000 second-feet in 8 hours, you would have to close down for the other 16, would you?

A. I assume so; but I don't think an intelligent use would involve any such use of water; in fact, this particular load curve you are presenting there, is in my judgment an idea of about the average load curve that would be used during the year. It might not be. It might not be at all feasible to use that particu-
lar load curve. It might be a half of that or a quarter of
2576 that, under low-water conditions. I would expect that
plant to be run by intelligent people that would use sense and take care of the necessary conditions to preserve their rights and the rights of other people. They have tried to do it in all the plants that I have been associated with, and that is a great many.

Q. The conclusion of your testimony on this point, as I gather it, is that intelligent people would not run it so they would take less, say, or a discharge of 8,000 second-feet for 8 hours a day, but that would not be done by people who were venal, and careless and selfish, if they saw fit?

A. It could be run in any way you might assume, under those conditions.

Q. Under those conditions.

By Mr. **Thompson**:

Q. You were asked a general statement this morning by counsel as to the flow of the river being indicated at a gaging station at a certain height on a river (let us say on New River—I kind of think that they got down close to New River), and that the flow down below was less than the flow at the point above; do you recall that?

A. Yes; I recall that.

Q. And you answered generally, I believe, that that would indicate that the Geological Survey reports of stream flow, or gaging station reports, had been taken carelessly or incorrectly, or something was wrong with them; is that correct?

A. Essentially; yes.

Q. What, if any, situation did you have in mind on New River with respect to those questions?

A. Well, the material increase in flow on a straight stretch of river, where there was perhaps no tributary, where the upper gages showed a very material increase over the lower gages, in my judgment that just can't happen in this country. It happens very commonly in the west. I have seen flows on the Tucson River coming down from the mountains and absolutely disappear and sink. In this part of the country with your ground
water curves towards the river (the water flows towards
2577 the river), and where there is earth and gravel, through
those especially, I know of no place around this part of the country, although in certain cavernous regions it might occur, but I know of no place along New River where seepage could take place. Of course, evaporation could take place, but that is a small element.

Q. You do not know the evaporation on New River, do you?

A. No.

Q. Nor the absorption in the river from plants?

A. There is not much absorption in the river from plants.

Q. You draw the conclusions that there must be a mistake by the Geological Survey men who were keeping charge of the gaging stations?

A. I would say a mistake in the reader or the rating of the streams. These rating stations change more or less from time to time, and very frequently you have to establish new ratings.

Sometimes they are off very materially, due sometimes to the filling at the cross section or the gaging station, or sometimes through the digging out, sometimes to obstruction by logs and matters of that kind, so I have found stations very seriously in error—as much as 50 percent.

Q. Were you talking about a supposititious case when this question was put to you by counsel, or did you have some specific case on New River in mind?

A. I had no specific case. I do not know of any personally on New River. I understood the question to have been if there was a very large decrease in flow between upstream and downstream on New River, and what it meant in my judgment, and I would say it would mean an error in one case or both.

Q. There was some testimony to the effect that at Caperton (Caperton is a place, I guess, 18 miles above Kanawha Falls, a stream gaging station), the gaging station records showed a certain flow; then there was testimony that a gaging station down at Kanawha Falls showed a flow that was less, 120 second-feet less, and then there was testimony to the effect that in between the Caperton gaging station and the Kanawha Falls 2578 gaging station there was the power plant of the Glen Ferris project, which is owned by the Electro-Metallurgical Company, and there was a chart produced showing that on the specific day when these two gaging stations records were kept, that at a certain time at Kanawha Falls, at 2 o'clock in the afternoon, there was a sudden cutting off of the flow of that stream that would account for the 100 or 120 second-feet, under such circumstances, would a situation of that kind clear up the problem that you say that you would not say was a mistake in the report of the Geological Survey—and I might add there was no corresponding falling off in the gaging station at Caperton?

A. I understand from your question that you are stating as a fact that the flow was interrupted in some manner and held back?

Q. In an artificial manner, I am assuming?

A. That might be the reason for the fluctuation of gages, and the point I meant to emphasize this morning was that with the stream in normal flow in this part of the country, there would be no materially less discharge at a downstream station than at an upstream station on the same stream.

Q. And that the only way that that could be changed would be by some artificial interruption?

A. Well, that is true.

Q. Isn't it quite possible, Doctor, that you may have a gaging station above a reservoir show a different flow from the gaging station below the reservoir—a greater?

A. Surely the reservoir might store all the water and there might be no water running lower, and it might make a certain amount of reduction in the flow.

Q. Doctor, if the Radford reservoir were not full and the flow in it were 9,000 second-feet, or even somewhat more, is it not reasonable to assume that the Radford plant might be operating on a peak load?

A. That depends on the demands of the system, I expect. It might be operating on the peak load at some time in a day.

2579 Q. If 9,000 second-feet were coming in, and you had the capacity for 9,000 second-feet discharge, isn't it reasonable to suppose, if you were on a load demand of that kind, that you would put it on peak?

A. I should think under those conditions that what you would do would be to bring the plant up to its capacity and operate it uniformly thru the day at 9,000. That would be the purpose of the plant and of the reservoir. Does that answer your inquiry?

By Mr. THOMPSON:

Q. I will ask you this question, Doctor: If the Radford reservoir were not full, and the inflow to Radford was equal to 9,000 second-feet, is it not quite likely that the plant would be operated so as to peak a portion of the inflow, using the remainder to replenish the reservoir?

A. I should think if there was not a demand for the power, they would necessarily save the water in the reservoir, and I do not see how they could peak 9,000 second-feet when 9,000 second-feet, as I understand, is the total capacity of the plant.

Q. The question here was the peaking of a portion of the inflow, using the remainder to replenish the reservoir?

A I do not quite recognize the language you use. I think you might use a certain amount at the rate of the 9,000 second-feet and operate other times during the day at less, allowing the difference to stay in the reservoir.

Redirect examination by Mr. JACKSON:

Q. Dr. Mead, assuming a hydraulic capacity of the power installation at the Bluestone reservoir to be 11,000 second-feet; is there any reason why any flow into the Bluestone reservoir not exceeding 11,000 second-feet should not be reregulated in the operation of the Bluestone power station?

A. I think it would be entirely controlled, reregulated or utilized or whatever you might call it, by the Bluestone plant.

Q. In connection with your cross-examination on gage errors in U. S. Geological Survey, I think you said, and said on 2580 your direct, that in your judgment the factor of error in recent estimates of stream flow would be on the order of 5%. Will you state whether or not you there refer to the average or possible errors in individual measurements or estimates?

A. The general average estimate of about how those things stand, in my judgment, as a whole; individually they may be very large errors. There are very large errors at times. I have found them.

Q. Can you give some indication of the errors of individual estimates?

A. They run from very small factors up to sometimes 50%.

Q. You also testified to the fact that the same gage readings at a particular gaging station on the same stream may relate to different flows depending upon whether the gage represents a condition of steady flow, rising flow or falling flow. Will you state what is the order of variation which results from those three different conditions at a gaging station?

A. Well I should think there might be an order of, I am naming now an extreme of course, of possibly 15% or 20%, usually less.

Q. You were cross-examined somewhat about the matter of the water supply at Charleston. Will you please state whether or not the taking of the water supply of a city from the same stream to which the effluent is returned substantially decreases the volume of flow below the point of return?

A. No; it does not. The average sewage of a city is pretty close to its water supply. That is the usual basis except where storm water is taken in and the sewage may be greater.

Q. The effluent and pumpage are practically equivalent?

A. Usually, but exceptions. Sometimes the sewers leak and it is increased, and sometimes the leakage is in and sometimes out, may be increased or decreased. A great many conditions arise.

2581 F. W. SCHEIDENHELM

Direct examination by Mr. JACKSON:

Q. Please state your full name and residence for the record.

A. F. W. Scheidenhelm, New York City.

Q. What is your occupation?

A. I am an Engineer, Consulting Hydraulic Engineer.

Q. Where do you practice?

A. New York.

Q. What has been your education?

A. Aside from an ordinary secondary school education, I attended college at Cornell University, completing the course for the degree of A. B. which I received in the year 1905, and the course for the degree of Civil Engineer, which I received in the year 1906.

Q. What has been your experience in the practice of your profession?

A. If I am to give that in detail I shall need some notes which I do not have before me.

A. (Continuing after securing notes.) After graduation from the Cornell University in 1906, and after several summers of practical work of one kind and another, I became in the summer of 1906 Structural Engineer with West Penn Railways Company, and beginning in 1907 was placed in charge of its Structural Department. At that time I installed a 6,000 KW additional capacity in its main steam-electric plant at Connellsville, Pa., which amount seemed large in those days, and was relatively larger than it is in these days. I had charge of design and construction of additional boilerhouse, condensing-water system, coal-conveying system, etc. Also, as Structural Engineer, I designed and constructed certain reinforced-concrete bridges and transmission towers.

I reported on various hydroelectric projects and dams for American Water Works & Guarantee Company.

1909 and continuing to 1911, I was in independent engineering practice, with headquarters at Connellsville, Pa. I acted
2582 as Chief Engineer of Pittsburgh Hydro-Electric Company; Consulting Engineer for Union Utilities Company of Morgantown, W. Va.; and as Chief Engineer of Georgia-Carolina Power Company. I made miscellaneous investigations on steam power, water supply, and hydroelectric projects.

From 1911 to 1914 I was Chief Engineer of Hydro-Electric Company of West Virginia and West Virginia Development Company, Pittsburgh, Pa. During that period, namely, from 1913 to 1914 I was also Vice President of Hydro-Electric Company of West Virginia.

1914 to 1915 I was Consulting Engineer at Pittsburgh, Pa. During that period I took a trip to the far west, which was a combination of business, pleasure and professional education. I visited thirty-four hydroelectric developments west of the Mississippi River.

1916 to 1917 I was in New York City, having gone there in early 1916 and became associated as the New York associate of Daniel W. Mead and F. W. Scheidenhelm, engaged in Hydraulic practice. Also, I was interested in an officer of the Scheidenhelm

Construction Corporation, engaged in certain construction in the vicinity of New York and in Connecticut.

From May 1917 to August 1919, I was in the Military service. After having received some degree of Military education I went to France. In due course I commanded the 26th Engineers and attached troops in charge of Water Supply of the American First Army front, during St. Mihiel and Meuse-Argonne offensives, and did various other things and came back to the United States.

From 1919 to date I have continued in the Consulting Engineering practice in New York practicing in water-power matters in association with Dr. Mead.

I have had direct responsibility as to detailed design and construction as follows:

Exploration and design of 20,000 HP development on Savannah River, Georgia, for Georgia-Carolina Power Company; 30 ft. by 2,500 ft. dam with locks. I carried that through the stage of securing approval of plans from the War Department in 1910 to 1911.

2583 I was in charge of exploration, design, and partial construction of State Line or Lake Lynn development, Cheat River, West Virginia (1911–1914), for the Hydro-Electric Company of West Virginia, a part of the so-called West Penn power system. That involved a dam 85 ft. by 1,100 ft. and installation of 48,000 H. P.; and an expenditure of $1,500,000 prior to the financial failure of the controlling financial interests, due to controlling Western irrigation projects. Later, in 1920, and continuing through 1925, I was Consultant to the reorganized interests under American Water Works and Electric Company, until the State Line dam on Cheat River was completed in somewhat larger form, so far as concerns capacity.

I was in charge of the exploration, design and partial construction of the Big Sandy Creek development in Pennsylvania and West Virginia in 1911 to 1914, for the Hydro-Electric Company of West Virginia. The dam there reached only its preliminary stages. It was to have been 200 feet high, to have involved a 3½-mile tunnel, a 600 foot head and 50,000 HP of installation.

The Lake Lynn installation, by the way, was finally made to a total of 70,000 HP. I was in error in stating its completion was in 1925. It was completed in 1926.

Some years earlier, 1914 to 1915, I had charge of the repair and reconstruction of the Stony River Dam, West Virginia, for the West Virginia Pulp and Paper Company. That dam had failed in 1914. There I had complete responsibility for the design and supervision for the reconstruction.

I reported, or acted as Consultant for banking houses, power companies, municipalities, etc., on various hydroelectric projects, during the period 1910 to 1933. This list includes the following, beside those which I have heretofore mentioned:

The Auglaize River, Ohio, 8,000 HP.

Blackwater River, West Virginia, 44,000 HP., and a total head of 1,400 feet, practically the highest, if not the highest project east of the Rocky Mountains. By highest project I mean highest head. Later it has been proposed to cut that development into two stages.

Fall Creek, New York, 15,000 HP.

A development on Shavers Fork, West Virginia.

2584 On Mongaup River, New York, of 28,000 HP. development.

Another on Neversink Creek, New York.

The development of the Province of New Brunswick Development on Musquash River, Canada, a report for the City of St. John, 10,000 HP.

An investigation and report on the dam of the Arkansas Light and Power Company, on the Cauchita River, Arkansas.

An investigation and preparation of preliminary plans for a development since constructed by ——— Power Company, Riviere des Prairies, Quebec, Canada, 120,000 HP.

An extended study on a series of projects on Cheat River in northern West Virginia, and to a minor extent in Pennsylvania. The total capacity of the series being approximately 700,000 HP.

As to the Oswego River, New York, a report for the City of Oswego on economics of utilization of the water power on that river, 7,500 HP.

The North Fork of the Kentucky River in Kentucky, 53,000 HP.

Tributaries of Craig Creek, near New Castle, Virginia, 7,500 HP., the result of that being an adverse report.

Smith Mountain project on Roanoke River, Virginia, 36,000 HP.

Talleys Falls project on Roanoke River, 30,000 HP. That is likewise in Virginia and near the North Carolina line.

A combination, hydro and pumping project near Steubenville, Ohio, 70,000 HP.

A so-called Little Tunnel project on James River, near Buchanan, Virginia, 16,000 HP.

A similar combination hydro and pumping project near Philo, Ohio, in the same amount.

Watauga River projects, North Carolina, 54,000 HP.

Table Rock project on White River, Missouri-Arkansas, the dam site and reservoir only being under consideration by me, 20,000 HP.

The Greenville development of the Tennessee Eastern Electric Company, on Nolichucky River, Tennessee, which was a problem of a sick dam.

The Passaic River, N. J., where I acted as expert in be-
2585 half of Passaic Valley Water Commission, representing
three municipalities in proceedings for condemnation of
Passaic Consolidated Water Company.

2586 In more recent years, that is, since 1925, beside an exten-
sive contact with projects on the New and Kanawha
Rivers, I had charge of the reconstruction, involving rearrangement and enlargement of the Reusens hydroelectric development on the James River, near Lynchburg, Virginia, with a total installation of about 17,000 HP.

Also, since that period I have served as Consultant to the Public Service Commission of New York on appraisals of about ten water-power sites or construction developments in New York State.

More recently I served as a member of the Board of Consulting Engineers on Norris Dam of the Tennessee Valley Authority of the United States.

Q. Have you made any special studies, or had any special experience in the matter of stream flows?

A. I have necessarily, as a Hydraulic Engineer, dealing with water power, had to do extensively with stream-flow measurements, estimates, and of course the practical use of stream flow. In earlier years I undertook various work which required stream-flow measurements, many of which were, the results of which, were published by the U. S. Geological Survey, through its Water Resources branch, and likewise made current meter measurements myself in behalf of the Survey.

Q. Are you familiar with the field of hydrology?

A. In reservoir work and dam construction the fields of hydrology and hydraulics and geology intertwine to a considerable extent. Hydrological problems have come up for attention from time to time largely in connection with the possibilities of leakage from reservoirs, leakage possibilities from stream-beds, leakage possibilities at dam sites. I made an extensive investigation as to the possibilities of leakage of a reservoir site in
northern West Virginia in a limestone country. I have
2587 investigated a similar problem in Tennessee, and in con-
nection with the Radford project, which is the subject of
this case; conducted a series of investigations extending over a

period of several years and costing at least a quarter of a million dollars, all having to do with the problem of hydrology.

Q. Are you a member of any professional or technical society?

A. I am a member of the American Institute of Consulting Engineers, American Society of Civil Engineers and Fellow, The American Association for the Advancement of Science.

Q. Are you registered as a professional engineer in any of the states?

A. I am, in New York, Virginia, and West Virginia at least.

Q. Col. Scheidenhelm, are you acquainted with New River?

A. I am.

Q. Will you state when your acquaintance with New River began and the occasion for such acquaintanceship as you have of New River?

A. My first professional contact with New River or anything in regard to it, for which I had responsibility, was in 1925; but I recall that in 1913 and for several years later I had knowledge of New River and possible developments on New River, but in a way for which I had no responsibility. In 1925 Daniel W. Mead and F. W. Scheidenhelm were engaged as Consultants by American Gas and Electric Company, in behalf of Appalachian Electric Power Company and other subsidiary corporations operating the power system which is interconnected and extends from approximately Lynchburg, Virginia, on the east to close to Chicago on the west.

Q. With what portions of New River are you familiar?

A. I have not personally been farther upstream than approximately Boyer's Ferry, which is up toward the North Carolina Line, although I have had various investigations and inspections made under my direction still farther upstream. From Boyer's Ferry down to the Byllesby development of Appalachian Electric Power Company I am not familiar, by reason of many inspections, but from the site of the Bullesby development 2588 down to the mouth of the river I think it is fair to say that I am quite familiar with the stream. I have not visited every bit of it, but the parts I have not visited are very limited in extent.

Q. I produce a chart, which bears the legend, "Profile of New and Kanawha Rivers from Forks of New River in North Carolina to Ohio River, showing existing and proposed power developments" and ask to have it marked "Defendant's Exhibit #600 for identification."

2589 Examined by Mr. Jackson:

Q. Colonel, I show you copy of the chart which was marked "Defendant's Exhibit 600" for identification, just before the adjournment of last evening. Please state what the exhibit 600 for identification is? I do not mean to tell what it shows, but just what it is?

A. It is a profile of New and Kanawha Rivers from the forks of New River in North Carolina to the Ohio River, showing existing and proposed power developments.

Q. Was that chart, Exhibit 600 for identification, prepared by you or under your direction?

A. It was prepared under my direction.

Q. And does it accurately portray what it purports to show?

A. It portrays it with what I believe is reasonable accuracy. I would not say there is not a minor mistake, but I accept it as accurate.

Mr. Jackson. We offer it in evidence, Exhibit 600 for identification.

Mr. Thompson. May I ask if it purports to show the railroad and the correct distances from the bank of the river?

Witness. The only way in which it would show that would be in elevation, and I think it is approximately correct in that respect.

By Mr. Jackson:

Q. Now, please state what is shown with respect to New River by the profile marked "Exhibit No. 600"?

A. It shows the profile of the river at a water condition which probably is about ordinary water level. It is not possible, on such a scale, nor was any attempt made to show any particular stage of the river, although certainly it is not a flood stage on the river.

In addition, there are shown certain paralleling railroad lines,
likewise shown in elevation, because it is a profile, and
2590 there are shown varying existing and proposed navigation
and power developments between the mouth of Kanawha
River and the junction of the North and South Forks of the New
River in North Carolina.

Also it indicates the ownership of the various power developments existing and proposed which, in elevation, are depicted on profile.

Q. Where is the Radford development?

A. The Radford development is near the right-hand end of the profile. The horizontal scale of the profile is in miles measured from the mouth of Kanawha River, and the site of the Radford development, according to that scale, in miles is at approximately mile 252. It is marked "Radford development" on the profile.

And where are the Buck and Byllesby developments with
ence to Radford, as shown on Exhibit 600?

The Buck and Byllesby developments are the next develop-
s in an upstream direction, and the Buck development is
ed "No. 4, Buck," at about mile 297. That development
named after Harold W. Buck, who has testified in this case.
e Byllesby development is about mile 300. That is also
n as New River Development No. 2. The numbers are those
ppalachian Power Company and subsequently Appalachian
ric Power Company.

that same series of numbers, the Radford development is on
ion known as New River Development No. 6.

Is there shown "New River Development No. 1"?

Just upstream from the Byllesby development is a develop-
"New River No. 1," and between Byllesby and Buck devel-
nts is a site on New River "Development No. 3."

By Mr. THOMPSON:

Could you tell us on No. 1, is that owned by some-
body?

By Mr. JACKSON. I was going to ask whose proposed de-
velopments are these.

As shown by the chart, which is according to the legend,
sites are owned by the Appalachian Electric Power Com-
They are developments which had been proposed by its
cessor, Appalachian Power Company.

By Mr. JACKSON:

Further to the right on Exhibit 600 are certain projects
nated, respectively, Boiler project and Osborne Falls project;
are they?

If counsel doesn't mind, to complete the story in an up-
n direction, there is another existing development on New
just upstream from the site of the Appalachian Develop-
No. 1. That existing development is at Fries, Virginia, at
mile 308. It is owned by Washington Mills, I believe.
en still further upstream, at about mile 321, is the Boyer
ct of Appalachian Electric Power Company, and still fur-
upstream, at about mile 343, is the Osborne Falls project
same company. Those two projects are at storage reservoir
cts, with which there would be combined some degree of
r development, but they may appropriately be described as
vater storage projects.

Have you now described all the projects upstream from the
ord development, as shown on Exhibit 600?

I have.

Q. Will you now describe the projects on New River downstream from the Radford project, as shown on Exhibit 600?

A. Between the site of the Radford project and approximately Glen Lyn, Virginia, there is no proposed water power development, so far as I know—at least none proposed at the present time except so far as concerns minor mention in the 308 report on the Kanawha River.

2592 On the profile is shown the Bluestone power project of West Virginia Power Company, a subsidiary of Appalachian Electric Power Company. That project extends from about mile 163½ to a point just below Narrows, Virginia. It consists of a two-stage development, the stages being known as Hinton development and Bull Falls development, respectively. The site of the Hinton development is about mile 163½, involving a low dam for a reregulating reservoir.

The site of the Bull Falls development is at about mile 172 at Bull Falls on New River. That is a high dam, intended for storage and power development.

Continuing down the river from the site of the Bluestone development past Hinton, there is shown Sandstone Falls, otherwise known as Richmond Falls, a development of an indirect type, proposed to be made by Electro-Metallurgical Company, which is identified as subsidiary or otherwise with the Union Carbide & Carbon Company. That development is in prospect.

Nearer the junction of the New and Gauley Rivers, and, specifically, at about mile 105, is the site of the dam of the Hawks Nest development of the same Electro-Metallurgical Company. That is a large development now in existence and in operation. It is of the indirect type. That is, the water is taken out at a diverting dam through headgates, and is carried through a tunnel for a distance of three or four miles to a power station at about mile 98.

Although the tunnel is three or four miles long, the distance by river is five or six miles, and, therefore, the tunnel length as shown on the profile has had to be stretched out, and it is shown dotted. That is because the profile is along the river and not along the line of the tunnel.

The tail water from the Hawks Nest power station empties
practically into the headwater of the Kanawha Falls de-
2593 velopment of the same Electro-Metallurgical Company.
That is a relatively small development. It was made about
1901, I believe.

Q. Is that sometimes called the Glen Ferris development?

A. It is.

Q. Have you completed your description of the projects on e New River, as shown on Exhibit 600?

A. I have, and I have gone into Kanawha River to the extent f the Kanawha Falls development.

Q. Are you familiar with the Kanawha River?

A. I am.

Q. To what extent?

A. I have traversed it from its mouth to its head, and have ad occasion to spend considerable time at various special places ong the Kanawha River.

Q. Referring to Exhibit 600, please explain what is shown ith reference to navigation and power developments existing or roposed on the Kanawha River?

A. In making this profile one was faced with the difficulty f attempting to show what would be in existence in the future nd what is in existence now, and on the Kanawha River portion f the profile there is an attempt to show both the conditions of e near future and likewise the existing conditions.

If one goes back two or three years in point of time, one will nd that the conditions on the Kanawha River involved ten low avigation dams, the two up-streams being of the fixed type and e eight downstream of the wicket type. In the meantime, the pstream four of those dams have been displaced. They are umbered 2 to 5, inclusive. There never was a No. 1.

In the lower left-hand portion of the profile, rather faintly, are own the locations of the existing dams, Nos. 6 to 11, inclusive, nd likewise the nominal pool elevations of each of those six ams.

The upstream four dams which were displaced, were displaced——

594 Mr. Thompson. Excuse me. Have you got any more of those maps?

Mr. Jackson. The photostat does not show very clearly, I ink, Mr. Thompson.

Witness. The profile shows nothing on the Ohio.

By Mr. Thompson:

Q. Is there any indication of wicket dams on the Kanawha?

A. Yes; there is on the photostat, I think, of the same profile. is very faint. The notations seem clearer on the original art. They are below the profile of the river itself, and there an arrow pointing upward.

Q. It is very faint?

A. The locations of the respective dams can be seen by an rrow pointing up to each site.

Q. There are five of those arrows?

A. I can count six.

Continuing then, the four upstream navigation dams of the old type have been displaced by two high dams of the roller-gate type. The upstream of these two dams is the London Dam, and, under the new system of numbering of the U. S. Engineer Department, is No. 3. The next in the downstream order is the Marmet Dam, and under the new system of numbering, that is No. 2. Each of those dams has a power development, constructed and operated by the Kanawha Valley Power Company, a sister company of the Appalachian Electric Power Company. These stations are operated under license from the Federal Power Commission.

Still further downstream, at about mile 30½, is the site of the Winfield navigation dam of the United States, under construction. The dam, which will have its pool elevation at 566 feet above mean sea level, will drown out the sites of the three existing and wicket-type dams numbers 6 to 8.

Q. Inclusive?

A. Inclusive.

2595 At the site of the Winfield dam, there is likewise under construction a power development by the same Kanawha Valley Power Company, similarly under license from the Federal Power Commission. It is being constructed and will be operated under a different license than that which controls the construction and operation of the London and Marmet developments. The London and Marmet developments are known together as the Kanawha project.

The Winfield development, upon the records of the company and presumably the Federal Power Commission, is known as the Winfield Project.

Still further downstream is shown the head of backwater of the Gallipolis dam now being constructed on the Ohio River by the United States. That dam will backwater up the Kanawha River to the foot of the Winfield dam, and, when completed, will drown out the sites of existing and old navigation dams numbers 9, 10, and 11.

The navigation project of the United States for and in connection with these new high dams is a nine-foot project. The former project and that which is still in operation in respect to pools Nos. 6 to 11, inclusive, is a six-foot project.

By Mr. **Jackson**:

Q. Col. Scheidenhelm, you just testified that prior to the recent improvements on the Kanawha River, there were ten old gation dams, of which Dam No. 2 was the furthest upstream; [right about that?

. Yes.

. What was the distance between the Radford dam site and old No. 2 dam?

. A. t 160 miles; perhaps a little nearer 163 miles.

. I think in your qualification you stated you have been sulting Engineer for the Appalachian Power Company and its affiliates since 1925?

A. That is correct.

Q. Will you please state what has been your connection the power developments of the Appalachian Electric Power npany and its affiliates on New River and the Kanawha River?

.. Perhaps the most convenient way of making that state- it would be to use the profile of Exhibit 600, and to begin the Kanawha River. That is at the lower left-hand end he chart.

By the Court:

. Col. Scheidenhelm, the plaintiff introduced here Exhibit 119, and purports to show the proposed improvements along Kanawha River. On that I notice set forth what they call Vhitethorne project, a proposed project, it looks like about miles below Radford and Monkey Shoals. That is not shown your map.

.. That is one of the projects which I have referred to as be- included in the so-called 308 report of the United States gineering Department upon Kanawha River, which report is, elieve, Exhibit 145 in this case.

. Is the same true then of what is known as Barren Springs ject?

.. Yes. There are others, undoubtedly. For instance, there headwater project set forth in that report known, I believe, Moore's Ferry project, with its site somewhere in the vicinity Boyer's Ferry. It is not there because it is in the neighbor- d of Moore's Ferry. It is not exactly there, but in that vi- ty. The Moore's project and the Boyer and Osborne projects the Appalachian Electric Power Company could not both t at the same time. There are undoubtedly other projects set h in that report. So far as I know, they are not authorized jects.

. Your diagram of that section of the river shows what you designate as the Bull Falls project; right below is reregu- lating dam. That section of the river is comprised within the Bluestone project, isn't it?

A. Well, one needs to keep clear which Bluestone project one speaks about. On this chart there is a project which is labeled "Bluestone Project;" that means the Bluestone power project of the Appalachian Electric Power Company.

Q. What I am getting at is this: You have designated here Bull Falls development, and immediately below it is "Hinton development," which, according to the legend, is "proposed power development of West Virginia Power Company." Those developments cannot be made under existing conditions, can they? I mean, isn't that portion of the river there being developed under the Bluestone project, which has been referred to throughout this case, a storage dam proposition of the Federal Government?

A. I was about to say that that same scope, from the Hinton dam site to the headquarters about Narrows, is comprised in the Bluestone reservoir project, which has been recommended by the Chief of Engineers and Secretary of War.

By Mr. THOMPSON. May I ask a question for my information at this time? Is this Exhibit #600—does it show so far as New River is concerned, only the projects which are constructed or proposed to be constructed by the Appalachian Electric Power Company?

By the WITNESS. As distinguished from what?

By Mr. THOMPSON. As from those proposed by the Government.

2598 By the WITNESS. That is correct so far as projects other than navigation projects are concerned.

By Mr. JACKSON. You refer to navigation projects on Kanawha River?

By the WITNESS. It is my understanding it is true on both the New and Kanawha Rivers.

Q. Will you proceed with your statement?

A. Beginning then at the lower end of the Kanawha River, in the case of the Winfield project of Kanawha Valley Power Company, I had a consulting relationship to it from its very conception, so far as concerns the power company, and continuing that relationship the general plans of the project were prepared under my direction. I conducted the negotiations between the Power Company and the Federal Power Commission, and likewise with the U. S. Engineer Department, so far as concerned certain navigation aspects of the matter, my relationship being with regard to all engineering matters involved. The construction is being carried on with such benefit as there may be under my consulting advice.

Proceeding upstream the relationships in respect to the London and Marmet Power developments were of the same order.

The London and Marmet dams were proposed in somewhat different form and under different names originally, by the U. S. Engineer Department. They had the names of "Pratt" and "Burning Springs" respectively, though I do not recall now which pertained to the London navigation project.

Various schemes of power development were proposed until finally the navigation project took definite form as set forth in a House Document, which I believe is an exhibit in this case, although I am not positive of that.

The negotiations were likewise conducted, so far as the engineering and economic aspects were concerned, under my
2599 general direction, and the general plans were so prepared.

The projects went to construction early in 1934, and because of the fact the Chief Engineer of Kanawha Valley Power Company was temporarily incapacitated by an accident, I acted as supervising engineer for several months in the case of the construction of the London and Marmet developments. I likewise am consulted in all important matters of operation insofar as affects any relationships with the navigation on the Kanawha River and in that connection with the U. S. Engineer Department.

Coming now to the New River and that portion between the Hawks Nest development and the Sandstone Falls development, there is a stretch of river which has a total fall of about 460 feet, and which occurs opposite [interrupted].

By Mr. THOMPSON. Where is that?

By the WITNESS. As I stated, between the Hawks Nest Development and the foot of the Sandstone Falls project.

A. (Continuing.) Throughout that area the riparian rights are owned largely as between Appalachian Electric Power Company and its affiliates, and Electro Metallurgical Company and its affiliates. I advised throughout the purchasing of those riparian rights by the Appalachian Power Company and its affiliates.

Q. Let me ask you at that point, what is the difference, if any, between the power market served by the Electro Metallurgical Company plants and the market served by the defendants?

A. The Electro Metallurgical Company supplies its own industries, and those of affiliated companies. Those industries are electrochemical or electrometallurgical, and in consequence thereof they have a relatively uniform load. On the other hand, the Appalachian Electric Power Company market is the ordinary public utility market, with a varying load; that is, it varies from time to time throughout twenty-four hours and over longer periods.

2600 Q. Will you continue with your statement with regard to these proposed projects upstream on New River?

A. As regards that stretch of river between the headwater of the Hawks Nest development and Sandstone Falls, the kind of power developments contemplated there, so far as the Appalachian Company and affiliates are concerned, will be of the indirect type. That is, they would be of the type like the Hawks Nest development, with low dams for purposes of diversion and pondage, and connected with tunnels which would have a length substantially shorter than the stretches of river between the diversion dam and the power station. Within that stretch of river the 308 Report of the Chief of Engineers refers to a series of low head developments, which of course are not shown upon this Chart, Exhibit #600, nor so far as I am aware are they shown on any published Governmental chart or map, and they are not referred to in any detail in the 308 Report.

Continuing them up New River, beyond the mouth of the Greenbrier to the Bluestone power project, West Virginia Power Company, I became familiar with that project probably about 1926. At that time it consisted of a single high dam at the site of the so-called Hinton development. That site is owned by West Virginia Power Company, as are approximately one-fourth of the lands involved in the power area. One might call it between the Hinton dam site and a point well up toward Narrows, Virginia.

By Mr. **Thompson**. You said one-fourth of the land?

By the **Witness**. Approximately. I do not know the precise amount.

A. (Continuing.) After studying that project it was changed under my advice into the form set forth in the chart. I had to
do with the application to the Public Service Commission
2601 of West Virginia for a license for that project, and have
acted as engineering advisor throughout the history of the
project since I first became identified with it about 1926.

Then continuing upstream one comes to the Radford project, or, as styled on this chart, "Radford Development". From 1925 until the present time I have had a Consulting Engineering relationship to that project.

Still farther upstream at the Buck and Byllesby developments I of course had nothing to do with the construction of those projects, they were built about 1911–1912; however, I have had to do with various repair work which proved necessary at the dams, and in the power stations.

Q. What, if any, engineering connection have you had with the Boyer's project and Osborne Falls project?

A. Both of those projects were laid out in my office, and I have, I believe, advised with regard to the acquisition of some of the lands with regard to those projects.

2602 Q. Colonel Scheidenhelm just state briefly the history of the Radford project.

A. The Radford project grew out of a plan of development proposed perhaps twenty-five years ago, by Appalachian Electric Power Company, under the studies and with the advice of Veilie, Blackwell and Buck.

Q. Is that Appalachian Electric Power Company or its predecessor?

A. I meant to refer to Appalachian Power Company, the predecessor of Appalachian Electric Power Company. There was a #5 development originally in mind, but, as stated by Mr. Buck, that was merged with the #6 development, and it now goes under the name of #6 development. When I became identified with the project, about 1925, the dam was proposed to be built at a dam site "A" and it was with reference to that dam site a Declaration of Intention was made, about June 25, 1925, to the Federal Power Commission. Subsequent studies of the dam site and reservoir caused me to recommend to the Power Company that the dam be constructed not at dam site "A" but at a site about one-fourth or three-eighths of a mile downstream. Such downstream site is the site at which construction is now being carried on. It is the site in respect of which the amended plans were filed with the Federal Power Commission, and were approved by the Chief of Engineers and the Secretary of War.

Q. Are those what are described as the revised plans in Government Exhibit 90–A, if you remember?

A. Yes, sir.

Q. Had you finished your statement?

A. I believe so.

Q. Between the time of the filing of the Declaration of Intention and the filing of the revised plans shown on Government Exhibit 90–A, were there any substantial changes made in the project?

A. Yes. Besides the shift in dam site, the height of the dam, or at least of the headwater level, was changed from about elevation 1840 above mean sea level to 1846. Likewise the 2603 design of the dam was changed substantially from its original form. As indicated at the time the Declaration of Intention was filed it was to be a dam with a long ungated spillway, and there were to have been flood gates at the left bank. In the revised plans the spillway was lowered somewhat and the plan involves the surmounting of that crest with a series of high sliding gates over the entire length of the spillway.

Q. What change, if any, was made with regard to the utilizable storage capacity?

A. The utilizable storage capacity was changed from about 40,000 acre feet to approximately 100,000 acre feet. That was accomplished in part by reason of the increase in height of water level or pool level, and in part by the lowering of the intakes or the pen stocks for the power station.

Q. What change, if any, was made in the capacity of the machinery proposed to be installed?

A. The capacity of the machinery installation as originally proposed was, as I recall it, 60,000 KW. It is now to be 75,000 KW., or in terms of hydraulic turbine capacity in rated form about 104,000 HP. That change was due in part to the increased head, in part to the increased available storage, and in part to the plans which had been made in the meantime for headwater storage.

Q. What is the significance of the plans made in the meantime for headwater storage?

A. The headwater storage would provide more water during the low water season and result incidentally in increased total energy output, because it would to some extent prevent the waste of flood water.

Q. What will be the capacity of the installed machinery in terms of water discharge at best efficiency?

A. Approximately 9,000 second feet.

Q. Colonel Scheidenhelm, are you acquainted with the power system of the defendant?

A. I am generally familiar with it, although not in ultimate detail, because it is a tremendously far flung system.

2604 Q. Does your familiarity extend to the steam generating stations and hydro-electric generating stations?

A. It does.

Q. Have you any familiarity with the market demands and load requirements of the Appalachian Electric Power Company system?

A. I have a general familiarity with that.

Q. Colonel Scheidenhelm, please state some of the elements of value of a hydroelectric project, such as the Radford project, to a large power system like that of the defendant.

A. There are various elements of value. One of them is what we call installed capacity value, that is the ability so far as machinery is concerned, and of water, to operate that machinery for the purpose of producing energy. That is distinct from the amount of energy that is turned out by that machinery. It is distinct from the work performed by that machinery. In the first element of value I have intended to include the regular normal utilization of that capacity as distinguished from emergency capacity.

Q. Is that reliable power producing capacity which you refer to or not?

A. In the main that is reliable power producing capacity, although if one takes the Radford project as an illustration, there is only a part of the total installed capacity that would be classed as reliable, and the remainder is available only from time to time for the purpose of turning out energy, or for the purpose of the second element of value.

That second element of value is the emergency use of the capacity for relatively short times when an emergency arises somewhere throughout the system. For illustration, emergency might arise by reason of lightning troubles which separate transmission lines, and thereby cut off a source of supply, power supply, for a portion of the system which has been receiving its supply from beyond the point where the trouble occurs. Under those circumstances it may be necessary suddenly and as nearly instantaneously as possible, to bring into play a new source of power supply. A hydroelectric power station is peculiarly adapted to come into play quickly.

Another illustration of sudden emergency might be an acci-
dent to a steam power plant, or conceivably equipment in
2605 a hydro-electric station somewhere else. That is, even
large power systems do have their troubles, although it is
bound to minimize them.

Now a hydro-electric power station like the Radford power station having its water directly at the power station, so there is not involved any time element of getting water started from pond to power station, is exceptionally well adapted for emergency. The time over which such emergency use extends is relatively short. It may be from a few minutes to, I would say, at most an hour and a half. Ordinarily it would be only one-half hour before other sources of power supply would be brought into play.

A third element of value consists of the work done by the power station. Expressed in another way it represents the energy which would otherwise have to be turned out by power plants elsewhere upon the system, and if such energy were turned out at steam electric power stations coal would have to be burned. I am not emphasizing the burning of coal as the measuring stick of the value, although it is true that in this region steam electric plants are essentially the measuring stick of value of hydroelectric plants, but rather I am referring to coal as representing the routine consumption of something representing energy or work.

The fourth element of value is existent with various hydro-electric projects, including the Radford project, and that is the benefit to downstream power stations of the same system by contributing stored water to those stations.

The fifth element of value is the ability of the station to operate without water, but in order to carry the ineffective portions of current developed throughout the system. Ordinarily we refer to it as wattless current. That is a relatively minor aspect of value.

There may be other elements of value which are relatively minor and which I have not enumerated.

By Mr. THOMPSON:

Q. I don't believe I follow you on that. Could you give that in a layman's language? You said wattless, did you not?

By the WITNESS. I did.

By Mr. THOMPSON:

Q. Would you explain that a little more?

By the WITNESS:

2606 That is related to what electrical engineers refer to as power factor. It has to do with the relation between the effective portion of energy which is produced, and the total produced in terms of kilovolt amperes. In a system like Appalachian Electric Power Company approximately 10% is ineffective. Now that ineffective current utilizes copper space in the generating equipment and in the transmission lines. It must be disposed of somewhere in the system. Sometimes it is taken far off by what is known as synchronous condensers, but it can be accomplished also within various power stations. I am not familiar in ultimate detail with that particular aspect of the hydro-electric business, because I do not claim to be, and am not as familiar with that particular aspect of a very broad field as I would like to be.

It is pertinent to state I think that a hydroelectric power station cannot simultaneously perform the functions of turning out effective energy to the maximum extent of its generators and at the same time absorb wattless current.

Q. In a power system like that of the defendant, is it necessary that any given generating station carry a specific portion of the system load.

A. It is not. The allocations of load throughout that system are dependent upon a great number of factors, which factors change from time to time. Steam plants and hydro-electric plants are used alternatively in various portions of the load, depending on conditions as they exist from time to time.

Q. Can you indicate some of the considerations which influence the part of the load which may be carried by particular generating stations; that is, what are the character of those considerations?

A. The considerations involved are the relative economics of operation of individual power stations or individual units within power stations. In the case of hydroelectric stations they involve the available water supply, both natural and that available from storage.

In general, variable portions of the load would be carried by hydroelectric stations, and in general the lower or non-variable portions of the load would be carried by highly efficient
2607 steam-electric power stations. The latter is generally not subject to much exception. The former is. By that I mean the allocation of hydroelectric capacity to the variable portions of a system load, is subject to change, particularly when there are higher flows available, for that hydro-electric station can operate more continuously and can and must do so in order to avoid waste.

Q. In the practical operation of hydroelectric generating stations are there any considerations other than those of economics of operation and distribution of system load that play any part?

A. There most certainly are.

Q. Generally indicate their character?

A. Such considerations, as in the case of hydro-electric plants, the rights of downstream riparian owners is an outstanding consideration.

Then there is the consideration of the water supply, which I have already mentioned, and that is not an element of system load by any means, and then there is any limitation which exists by reason of any possibility of interference with the navigable water downstream.

There are other considerations which may loom up from time to time. I am sure I have not indicated all of them, but I think those are the major items.

Q. If there were no limitations of the character you have last mentioned, what would be the desirable method of operating the Radford project?

A. That question needs to be answered in respect of two conditions. One is not unimportant, but is relatively minor in point of time, and as I understand it in respect of this case. That is, the condition when there happens to be a full reservoir at the Radford project and an ample stream flow, so ample as to equal

or exceed the installed capacity. Under those circumstances it would be sheer waste if the Radford power station did not operate uniformly at full capacity, and incidentally under those circumstances it would operate at a capacity not of 9,000 second
feet, which is the point of about maximum efficiency, but at
2608 something greater, about 10,000 second feet. The addi-
tional water utilized would be utilized at very low efficiency which could not be afforded except under conditions when otherwise there would be waste, but the principal use of the Radford power station, from the standpoint of time involved, would be when there is not enough water available, or when it is not desirable to utilize water beyond the economic prescriptions of the system as a whole.

Now your question being premised upon the absence of any limitations other than the system demands and the capacities of other power stations, and I would add water supply available from natural flow and storage, in my opinion the Radford power station would be utilized somewhere on the variable portion of the system load.

By Mr. Jackson:

Q. Will you please define what you mean by base load and peak load?

A. I have used the term "variable load", as meaning above that portion of the load which represents the minimum load upon the system within, say, a 24 hour period. The portion of the load up to that minimum represents a continuous load upon the system in an amount below which the load does not fall at any time within, say, a 24-hour period and that is styled a base load.

Q. Do the base loads and the peak load vary within themselves or are they relatively constant?

A. Both base load and peak load vary, that is, they vary from day to day, week to week, month to month, and season to season, all on the assumption that the total load in the territory has not changed. In addition, there are variations due to changes in the territorial load. In times of depression the load grows less. In normal times, at least so far in the economic history of this country, there is a growth in the load and there is still another factor that enters. I have referred to the territorial load, meaning by that the market demand within the geographic area served in a retail manner by the distributing company, but there are also
loads which come upon the system from inter-connected
2609 power systems, and not merely are there loads which
come from those interconnected systems, but there are portions of loads furnished from time to time by the Appalachian Company to such interconnected companies, all of the factors

f which enter into the picture, and determine where an individual plant will operate in respect of the total load of the ystem.

Q. You said a moment ago that there were times when a part f the load came from interconnected systems. That is not clear o me. Do you mean interconnected systems would be contributing power or drawing power?

A. By the expression "load from inter-connected systems" I meant the drawing of power by such inter-connected systems, that is, systems other than the Appalachian Company, from the Appalachian systems' power stations.

Q. I thought you said afterwards there would be times when Appalachian would be contributing power to the other systems, which seemed to me to be the same thing. That is the reason I wanted to get it straight.

A. It would be the same thing and I probably was confused in my statement. I mean to state that because of the interconnections sometimes power flows in substantial blocks from the Appalachian system, and particularly from its power stations to adjoining systems or inter-connected systems, and sometimes power flows in the opposite direction, that is, sometimes part of the retail load of the territory of Appalachian Electric Power Company is supplied from power stations of inter-connected systems, sometimes quite remote.

Q. Colonel, where would the Radford project fit into the load of the Appalachian System?

A. In my opinion it would fit into the load nearer the upper portion of the peak rather than into the lower portion of the peak, always having in mind, however, these limitations other than the demands of the system and the characteristics of other power stations within the system. Whether it would be entirely on the top or in what we style a sub-peak position, or still further down, depends upon a multitude of conditions which would have to be appraised by the operating staff at that time, but within the zone of the limitations that I have referred
2610 to, it would fit ordinarily within this broader scope of time into what may be styled some form of peak carrying operation of the system.

Q. Just before recess, in stating how the Radford project would fit into the load of the Appalachian system, you said that during a greater part of the time it would operate in some part of the peak but not necessarily at the top of the peak of the system. When you express the opinion that it would not necessarily operate at the top of the peak of the system, did you take into account the economic factors in the situation?

A. I should make clear, I think, that when I refer to some form of peak carrying operation I am referring to an operation within that part of the system load which is above the base load in short, to that part of the system load which varies within the 24 hours of a day, for instance. Unfortunately, the terminology of the art, or at least, my own terminology is lacking in words which cover the point exactly. Perhaps for present purposes I might describe the broad zone as the variable portion of the load, but at times I do refer to that as the peak portion, meaning the variable portion of the load. It is entirely conceivable to me that at times the Radford plant might, from the standpoint of economic factors alone, occupy the top of the variable or peak carrying position. At other times it might be operating further down, but in response to the question of counsel as to the necessity of its operating at the top, I would say that in my opinion it is not necessary to operate at the top of the variable portion of the system load.

By Mr. **Jackson**:

Q. In making that answer, do you take into consideration the economic factors?

A. I do. It is entirely possible, and even probable, that some other plant on the system, presumably a hydro-electric plant, would more appropriately assume the very top position. That depends upon the conditions obtaining at the time. I am referring now solely to economic factors, independent of the limitations of any consideration which would need to be given to the rights of downstream riparian owners or to any need for protection of the navigable capacity of some navigable water somewhere.

2611 Q. What is the characteristic of discharge from a hydro station operating on a base load?

A. It is relatively uniform. For practical purposes one might consider it absolutely uniform, though they never are absolutely so.

Q. What is the characteristic of discharge from a hydro station operating in the upper or peak portion of the load?

A. That characteristic is what I have already referred, to, variability.

Q. What is the characteristic of discharge of a hydro station operating on a subpeak load as compared with one operating at the very top of the peak?

By Mr. **Thompson**:

What do you mean by sub-peak load? I don't think we have had that defined here, have we?

A. In the term "sub-peak" there occurs that word "peak" to vhich I have already referred as being subject to more than one nterpretation. As used in that particular phrase "sub-peak", he word "peak" means the top of the variable portion of the oad and "sub-peak" means a load which is under the top of he variable portion of the load and yet is within that variable ortion: It may be at the bottom or it may be at some point ntermediately between the bottom and the top of the variable ortion of the load.

By Mr. Jackson:

Q. What is the characteristic of discharge of a hydro-station perating on a sub-peak load as you have defined it, compared vith a hydro station operating at the top of the peak?

A. The station or stations operating in a sub-peak position vould have a variable load but one involving less variation than n the case of a plant operating at the top of the variable or eak load.

By Mr. Jackson:

Q. Variable load is the same as variable discharge?

2612 A. They are analogous. I fear I went astray from the question. If the question was predicated upon discharge ny adjectives of characterization would apply essentially to discharge just as they would to load because, broadly speaking, the lischarge is directly proportional to the load, that is, in the case f a hydropower station, operating in a subpeak position, the lischarge is less variable than is true of the discharge from a tation operating at the top of the variable or peak portion of he load.

Q. Col. Scheidenhelm, is it possible to say now precisely how he Radford station would be operated?

A. It is not possible to say now precisely how it will be operated. I believe it is not feasible to go beyond the broad description which I have made. When the time comes for operation there will have to be taken into account the characteristics 2613 of the total load on the system, including both the territorial and the interconnecting portions of that load. Likewise, the characteristics of the other power stations of the ystem, including their capacity, their location, their relative conomics. There will have to taken into account the water upply available for the Radford station and likewise for the ther hydro stations, and there will most certainly have to be taken into account the necessity on the part of the operating staff to avoid taking any chances of incurring liability with regard to down-stream riparian owners or with regard to any

Governmental authorities insofar as navigation anywhere is concerned, and undoubtedly there will also be other limitations which will be dictated as matters of good business policy.

Q. Do those considerations establish a zone within which it is possible to say the future operations would fall?

A. Yes, they do establish such a zone. That is, laying aside the relatively minor part of the time when, in the absence of extensive headwater storage, the Radford plant would be operating at full capacity because of high water and full reservoir conditions, the Radford operation would fall somewhere within the variable portion of the system load.

Q. In determining the economic justification for a hydroelectric development, is such a project considered upon the basis of a relatively short or long life?

A. In that respect a hydroelectric development differs substantially from a steam-electric power development. The hydroelectric development would ordinarily be expected to have a life, of, let us say, from 50 to 100 years. Its economic justification must be appraised in the light of that long term of life. If a project follows the average of the experiences of hydro-electric projects built, it will have lean years, at least during the beginning of its operation. There are very few hydroelectric projects which have not had early years of red ink, so to speak, but the life of a hydroproject is so long that the debit balances of the early years can be spread over the remaining long period without weighing any individual year or years of that period too heavily.

With a development like a steam-electric power station the
2614 opposite is true. A steam-electric plant must begin to
earn its keep, so to speak, quite early in its life.

Q. Do those considerations have any effect upon the operation of a hydro-electric development in the early years of its life?

A. They would have this effect, that if because of absence of load or of excess of generating capacity elsewhere, or because of any limitations other than the normal economic factors, that is, if because of the limitations having to do with downstream riparian owners or any necessity for avoiding any liability in respect of effect upon navigation, if in regard to any of those things, it is necessary for some years to operate differently than mere economic factors would indicate, the result is merely in line with the ordinary experience of hydro-electric plants. As a matter of fact, under present circumstances, if the Radford plant should be brought into operation within, say two years, it is very likely that the system would have an excess of capacity to the extent of part of the Radford capacity; that is 75,000 kilowatts of additional capacity thrown upon the system at one time, may possibly be absorbed, but very likely it would be more than would absolutely be necessary at that particular time.

Q. Colonel, from what you have said as to the long life of hydro-electric plants, in planning or constructing a hydroelectric plant, do you take into consideration, for instance, other plans for head-water storage reservoirs or things of that character on the same stream?

A. That must necessarily be done. If in the case of a project like the Radford project there were any question as to the amount of capacity to be installed or the number of units to be installed, that question can properly be decided only before the plant or as the plant is being built. It cannot be postponed to the future without extensive costs, which undoubtedly would outweigh any conceivable advantage from a future change. Therefore, it is necessary to plan over the long range, to begin with, and capacity, for instance, must be set in the light of what is believed, in the light of the very best existing information, to be the reasonable prospect for the future.

Q. Then in designing and planning such a project, state whether or not consideration is given to other projects of the same company for development on the same stream?

A. Consideration would most certainly be given to other
2615 projects. Consideration would be given to the long range program.

Q. State whether in your view any re-regulating capacity below the Radford Reservoir is essential?

A. In my opinion, it is not, so far as concerns the Radford project.

Q. State whether or not under the plans of the defendant and its affiliates, for the development of power on New River, there nevertheless will be reservoirs having reregulating effect if those plans are carried out?

A. The plans of the Appalachian Electric Power Company and its subsidiary, West Virginia Power Company, do involve developments down-stream. They have gone so far as to include definite engineering plans in general, though not detailed, and they have involved expenditures running into great sums for investigations and acquisitions of lands and rights and dam sites. One of those projects is the Bluestone Power Project as shown upon Exhibit 600 which would involve a reservoir than which one could hardly conceive a better reregulating means for the Radford project.

By Mr. Jackson:

Q. Were those plans of the development of power developments on New River made before or after the Government proposal of the construction of its Bluestone project?

A. Years before there was any thought, so far as I know, of a Federal Bluestone reservoir project.

Q. Colonel, I believe you have already stated that in your judgment in the early years of operation of the Radford project, its capacity probably would not be needed by the defendant's system in full?

A. Yes.

Q. Does that mean that the Radford plant, under those conditions, would waste water?

A. No, indeed, but it means that the utilization of the Radford output in terms of capacity and energy would not be to so great an economic advantage as would result when the system needs the entire capacity. Thus the system of requirements are large enough so that all energy which can be produced at a hydro-station existing upon the system, including the Radford project, would undoubtedly be absorbed, and that means, to avoid waste, it would displace energy and capacity that would otherwise be produced by existing steam stations. To put the answer in another way, the saving would be definite, but would largely
2616 be merely in coal or fuel saving rather than coal and fuel
and labor saving, plus the fixed charges upon capacity which would otherwise have to be installed elsewhere.

Q. Does this circumstance that the defendant's system might not require the entire capacity of the Radford plant as soon as it is ready for operation affect the economic justification for the plant, in your opinion?

A. Yes; that is a consideration which has entered into my appraisal of the economic justification of the development and must enter into any intelligent appraisal of that situation. Having appraised it, however, the prospect of going along for any great length of time without the development of a demand for all of the available and reliable and emergency capacity of the Radford project is such that it does not outweigh the other advantages. The result is that the project as a whole, and in terms of its long life, is economically justifiable.

Q. You have testified that in your opinion, except during high water seasons, the Radford plant would be allocated some portion of the variable load of the Appalachian system. Please state whether on such an allocation the Radford plant would be operated on the same basis everyday, day after day and week after week?

A. It would not.

Q. By Mr. Jackson. Can you explain that a little more fully?

A. We are treating now, as I understand it, periods other than high water periods?

Q. That is right.

A. Within the period that may be broadly characterized as one of moderate and low flows, the specific kind of operation or method of operation would be determined by the availability of water in that stream flow and in the reservoir, and also there would be the considerations of load, power from other sources and those limitations which have to do with down-stream conditions to which I have already made reference. In the light of all of those, I believe that there would be variations from day to day and from week to week, but, generally speaking, I would think that there would be about the same kind of operation for the five days of the week, beginning with Monday and ending Friday; that over the other days of the week, Saturday and Sunday, the operation would be different.

2617 Q. In your opinion, would there be operation of the Radford station on Saturdays?

A. There would be some operation on Saturdays, but to a somewhat lesser extent than on other week days. The tendency—it is more than a tendency, so far as the Appalachian Electric Power Company's system is concerned—is to operate hydro-electric plants on Saturdays, but with maximum loads less than those on the five principal week days. The operation even extends into Saturday evening, or late afternoon peaks.

Q. In your opinion, is it reasonable to assume that there would or would not be operation of the Radford station on Sundays?

A. I would suppose, in the absence of any limitations other than strictly economic and service factors within the system, there would not be any operation on Sundays. However, it is a fact that there is a growing tendency on various power systems, and on the Appalachian Electric Power Company's system itself, to go into some form of Sunday operation, in prolongation, so to speak, of that tendency which has resulted in Saturday operation, but at present, I don't believe that tendency has gone far enough. My idea of the situation at present would be, in the absence of other limitations such as I have mentioned, there would not be any Sunday operation.

Q. In your opinion, it is reasonable or unreasonable to assume that the Radford power station would be shut down in prolongation of Sunday or Saturday, or Saturday and Sunday, by including either a Friday or a Monday?

A. That is very improbable. Certainly I cannot conceive of that taking place so far as to violate any limitations as regards down stream conditions, either of riparian owners or as affecting the navigable capacity anywhere.

Q. When you say limitations, do you mean any possibility of affecting those interests?

A. I mean limitations which would cause—limitations which would take the form of a decision by the operating authorities to avoid any possible risks of interfering with the rights of others or with navigable capacity.

By Mr. Jackson:

Q. Well, would the opinion you have just expressed,
2618 with reference to the reasonableness of an assumption of a shut-down in the week-end being extended to include either Friday or Monday, be affected by whether or not Friday or Monday might be a holiday?

A. No. Such circumstances are so rare that, quite aside from any other pertinent conditions, the savings which could result from not operating on Friday or on a Monday holiday, would be so small that it would just not be worth while to take any chances or risks involving the interfering with rights down stream. The saving would be of the order of a few hundred dollars, and there is another factor that would enter into that situation; with a large system, the mere inertia of an operating program or routine is such that, if upset for a single day, it involves a cost in effort and communication that interposes a barrier to any change in the routine.

Q. What is the operating plan for the utilization of the Radford storage?

A. The Radford storage will be filled during a period of higher flow and drawn upon during periods of lower flow. If it were used to the extreme extent of ironing out the low flow periods, so to speak, to the point of filling the valleys in the low flow periods, by means of a level line, a water filled valley, so to speak—then the operation would be governed by what would have been the experience during years of lowest flow, such as the years 1925 and 1930, on the basis of what would have been the experience during those years, had the Radford project been in existence. The storage of the Radford reservoir would not be drawn upon to any material extent prior to the beginning of such a low water period, and that beginning of low water period would find the reservoir full.

If the reservoir were operated so as to obtain the maximum energy output from the stored water, the aim would be to fill the low water season valley to the maximum and that would result in the equivalent of an average flow through the low water period of about twelve hundred second feet.

However, I am very skeptical as to whether that reservoir would be drawn upon to that extent—that is, to the extent 2619 of an average of 1200 second feet during low flow periods.

This is due to another factor in system operation, which I have not called by name, but that is very potent, and that is the policy of giving reliable service. The relation of the water in that storage reservoir to service on the system is very important.

If the reservoir is filled, it has a potentiality of full emergency service. I have already referred to that in connection with emergency capacity, but if the reservoir is almost empty, as it would be under such strict operation for leveling out the flow to the maximum extent in the low water season, then towards the end of the low flow season, the potentiality of emergency service would be present to a far less degree than with the reservoir more nearly filled.

The head, for instance, would be down and the total capacity which could be available, would have been reduced from 75,000 kilowatts to 53,000 kilowatts, and the time during which the 53,000 kilowatts would be available would be reduced in even greater proportion.

Therefore, I think that the tendency of system operation will be more and more to reserve portions of the 100,000 acre feet storage for insurance against emergencies.

Q. Colonel Scheidenhelm, as I understand you, the figure 1200 second feet is based upon the low flow of 1930?

A. That is true.

Q. How much——

A. (Interrupting.) I beg your pardon—1925 and 1930.

Q. How much does the storage augment the low flow for those years?

A. Roughly, it results in doubling the low flow.

Q. And that is on the site of the Radford Dam?

A. That is true.

Q. Well, assuming that one would not refrain from drawing down the utilizable storage gradually during low water—during the low water season, would that mean that the water would be used uniformly at the rate of 1200 second feet throughout that low water season?

2620 A. It does not. That 1,200 second feet would represent an average over months of low flow period, extending roughly over a total of six months. Within any one day, there would be fluctuations from the average of 1200 second feet. Undoubtedly, the average flow of one week would vary from the average flow of another week, but when one goes to periods as long as a month, I would expect it would be normal—it would be usual—the usual operation of a reservoir of this kind for the average flow of one month to practically equal the average flow of the other, and 1,200 second feet is the approximate equalized flow over the entire low water period.

Q. To what extent would the operation be affected by the character of a particular year, as a good or bad water year?

A. In a good water year, the daily use of water, meaning the average daily use of water, would, of course, be greater, and if it is a good water year, it will have manifested itself by better than low flows in July and August, and by that time, it will be apparent that a greater flow than the average of 1200 second feet can be utilized, and the result is a larger daily average utilization of water.

Q. Assuming that you encountered a year of greater drouth than previously experienced, would that have any effect on operations during that year?

A. Such a period would undoubtedly make itself manifest in the early summer, and if it should happen that, about the first of June, the flow in New River at the dam site, after making corrections for any interference and changes in the flow upstream, should fall or remain below 1200 second feet, that would be a signal, and any intelligent operation of the Radford project would result in cutting the cloth to suit the new circumstances—that is, it would result in a utilization of an average flow less than the flow of 1200 second feet.

Indeed, I would expect, for reasons that I stated, that the tendency would be to operate under 1,200 second feet, even in a 1930 low water year, rather than over that, but possibly the tendency to operate at 1200 second feet during low water years would remain.

2621 Q. What, in your opinion, would be the likelihood of all of the utilizable storage designed to provide 1200 second feet being drawn down and exhausted before the end of the low water season?

A. I consider that extremely unlikely. It is a theoretical possibility, if one wanted to follow out what has been referred to here under a nomenclature new to me, that is the rule curve, but aside from the theoretical possibility, I would not think it would happen. Rather the considerations of protecting the service, you would have some degree of reserve—some money in the bank, so to speak, and I would not expect the reservoir to be drawn down to the ultimate limit of the utilizable storage.

Q. What, in you opinion, would be the likelihood that the utilizable storage would be drawn down and exhausted prior to or early in a low water season?

A. That is merely an academic question. That is just utterly unreasonable.

Q. State your reasons more fully with relation to anything of that character.

A. I have, I think stated the essence of that. It merely means what perhaps may be explained by analogy. If a certain family is dependent upon an annuity received from an insurance company once a year, and received that annuity early in the year, then the part of wisdom is to spend only out of that in such a way as to make it last throughout the year. I think then that the use of storage is pretty analogous to that. The use or drawing down of storage ahead of low water year is unwise. It represents, in my opinion, unintelligent operation, for the reason that, during the low flow, there would not be a period for storing the water in the reservoir, and that would be contravention of the very purpose of providing storage.

Q. What effect would it have upon the reliability of the service of the Company?

A. This previous drawing down of the storage capacity of the reservoir would result in making an unavailable emer-
2622 gency capacity in the system and not merely an emergency capacity, but a great part of what would otherwise be reliable capacity.

It would result in reducing the daily average proportionate to the discharge and hence the output from the station from the level of approximately 1200 second feet to a level of approximately 600 second feet, which is in the neighborhood of low natural flow.

Q. In your opinion, is it to be reasonably or not reasonably assumed, or it is reasonable or unreasonable to assume that the Radford project would not be subject to shutdowns, other than possible week-end shut-downs of the character and extent you have described?

A. It would be reasonable to make that assumption.

Q. You have stated that the capacity of the Radford power station is approximately 75,000 kilowatts. Please state whether or not that is all reliable capacity.

A. In my opinion, that is not all reliable capacity. The question as to what is reliable capacity is essentially one of engineering judgment, and that must be exercised in the light of system requirements and possible methods of utilization.

The reliable capacity of the Radford project, I would appraise as somewhere between 35 and 45 thousand kilowatts. That appraisal, which is one that I have put before the company, is part of the economical justification of the project, as predicated upon the use of the project which, in my opinion, will be made of it during the periods of low flow, and it is, therefore, tied to the estimate of 1,200 second feet, or what one may call re-regulated flow during low water periods.

Q. Have you stated the factors that limit this reliable capacity—you stated fully how the water supply limits that capacity?

A. In that respect I would think my previous explanation would be applicable—that is, the natural flow of the stream augmented by the full extent of the utilizable storage throughout the low water period, strictly limit the output in terms of energy, and, therefore, limit also the output in terms of capacity. It just is not practical to utilize 1,200 second feet days on the aver-
age in such a way as to support a peak of 75,000 kilo-
2623 watts; moreover, as the reservoir levels approach a prac-
tical limit of 27 feet draw down, it becomes impossible from the standpoint of head alone for the power station to turn out 75,000 kilowatts.

At that limit, the draw down being zero and the utilizable storage also the available capacity is reduced to about 53,000 kilowatts, that limitation cannot be avoided.

The further difference between 53,000 kilowatts and the rate of 40,000 kilowatts or 45,000 kilowatts, of which I made mention, is due to the fact that the amount of energy available from the water to back up the capacity is limited.

Q. On that basis, Colonel Scheidenhelm, what would be the volume of water available for peak carrying during the five principal days throughout the low water season—the five principal days of the week?

A. I took it on the assumption that the average utilization throughout the low water season of 1200 second feet continually—the average of 1200 second foot days every day.

Q. This would be on the basis, as I understood you to say—it was the limited reliable capacity of the plant during the low water season?

A. Yes, sir; on that basis, the available water in terms of volume being 8400 second feet days per week, in my opinion, would spread over six days of the week with a greater utilization of the five days, Monday to Friday, inclusive, and the average utilization for one of these five days would be about 1,550 or 1,560 second feet days.

The utilization on Saturday would be lower, perhaps something on the order of 600 second feet days.

Q. What is the volume of flow which ordinarily would be available for use to the Radford power station?

A. Taking into account the natural flow and the available storage, I would say 2,000 second feet may practically be characterized as the flow ordinarily available.

Q. How does that compare with the average flow at the dam site?

2624 A. That is a little less than two-thirds of the average flow at the dam site.

Q. And how would such an ordinarily available flow be utilized?

A. If I may say first, by ordinarily available flow I believe is meant the ordinarily available flow for a point of time throughout the year or a term of years. As to the utilization of it, I would expect that it would fall within that zone that I have described as the probably zone of operation for the Radford power station. That would mean that there would be available for a week's output something like 14,000 second feet days per week on the average, and I would expect it to be operated in somewhat the same proportion as would the output resulting from regulated flow at the average rate of 1,200 second feet days.

Q. How much would that make available on each of the five principal days?

A. I could make a computation or refer to some figures I have here.

Q. You can get a memorandum and look at it, if you want to.

A. (Witness leaves witness stand and procures papers and returns to witness stand and figures.) I would say about 2600 second feet days, that is for each five principal days, with another thousand second foot day used on Saturday, making a total of 14,000 second feet days available for a week.

Q. Would a 2,600 second foot day be the maximum which could reasonably be available for some form of peak carrying operation during each of the five principal days of a week.

A. No, sir.

By the Court:

If they used 14,000 a week, and 1,000 on Saturday, there would be 13,000 through there, thus giving it only 2,600 second feet?

A. Assuming no operations on Sunday.

By Mr. Jackson:

Q. State whether or not in that distribution of the maximum amount which might be expected to be available in peaking for anyone of those five principal days—if anyone of those five principals days would be limited to 2600 second feet? 2625

A. No, sir, there could be variation among the five days, but I would think in the close neighborhood of 3,000 second feet days would represent the maximum which would be used under these circumstances.

Q. What, in you opinion, would be a reasonable form of peak carrying discharge at the Radford station for utilization of 3,000 second foot days' water in a single week-day operation?

A. I consider a reasonable form of discharge is that depicted on the chart forming Exhibit No. 594.

Q. Is that a form of discharge utilizing 3,000 second foot day?

A. Yes, sir.

Q. Does that assumed form of discharge from the Radford station, shown on Exhibit 594, compare in relation to the load requirements of the Appalachian Electric Power Company?

A. Yes, sir.

Q. What is that relationship?

A. That represents, in my opinion, a reasonable allocation of load. It cannot particularly be set up to represent any special allocation that would ever occur, but it would be very close to something, in my opinion, that would occur time and again.

It is my idea of a reasonable expectation as to one of the heavier forms of peak carrying which could be expected to be taken by the Radford project. It represents an operation that would be towards the top rather than further down on the system load. It represents an operation above rather than in a sub-peak position.

Q. Well, do any other assumptions enter into the form of discharge shown on this Exhibit 594?

A. I believe it has already been brought out that that chart is predicated on a week day operation, and upon such a week day operation as will utilize the discharge of water, I will say, of 3,000 second feet days.

The allocation of load is predicated upon the assumption that there would be no limitations of any kind by way of neces-
2626 sity for preventing any interference with navigable capac-
ity on the Kanawha River or any necessity by way of modifying the operation so as to prevent the incurring of any risk or liability of interference with downstream riparian owners.

Q. This form of discharge on Exhibit 594 has been worked out purely upon considerations affecting the system load and the system stations. Is that right?

A. Yes, sir. It is predicated solely on the economic factors other than those relating to downstream conditions.

Q. Its form was not modified in any respect by reason of any possible relation to riparian property owners downstream or any navigable conditions on the Kanawha River?

A. That is true.

Q. And does that mean, in your opinion, that the question of property rights downstream or navigable conditions on the Kanawha River would play no part in the adoption of a method of operation of such a plant?

A. By no means does it mean that.

Q. Was this form prepared for the purpose of testing the result of such a form of discharge?

A. Yes, sir, it was prepared for that purpose and, while not in the precise form of this chart—this chart was furnished by me to Professor Harold A. Thomas for the purpose of his studies and tests.

Q. You have testified that, in your opinion, the form of operation shown on Exhibit 594 would be a reasonable one?

A. Yes, sir.

Q. Are there other possible forms of the operation of this project?

A. There are many, many other forms. Of course, there enters the question as to how minor a variation one can have and still keep within the same form, but I am taking into account minor variations when I say that—but it is within the general scope, the general zone of the kind of operation which I would expect for that project, if there were no limitations of the 2627 kind so stated, but I would think it was nearer the upper limit of the available load that would be carried by the Radford plant, rather than being the approximation of the average availability or available load that would be carried by Radford.

Q. What I wanted was other methods of the operation of this project, which, in your opinion, would be reasonable, whether in the scope of field operation, it includes a number of methods of operation or not?

A. I think it does include a number of methods of operation, when one goes into the field of theoretical operations. I think, so far as the upper limit of variations is concerned, that anything materially more variable than this would not be reasonable.

Q. Are there many variations below that limit?

A. Below that limit there are many, many variations.

Q. Are you familiar with the testimony of Professor Thomas in this case?

A. Yes, sir.

Q. Have you given any consideration to the rectangular or block form of discharge from the power station? Mr. Thomas testified that he considered that in connection with his study of the power tides from the Radford station?

A. I have. I gave consideration to that form, prior to the work of Professor Thomas, and was responsible for his studies and tests with that possible form of operation, but I looked at it as embodying the literal meaning of possibility without any possibility of being probable, let alone certainty; I considered it to be a theoretical form—a theoretical plaything rather than anything in my opinion tnat would be reasonable to conceive as a natural occurrence.

By Mr. **Thompson**:

Q. That is the rectangular wave?

A. Yes, sir.

By Mr. **Jackson**:

Q. Why did you consider the rectangular form of wave?

A. I felt that it represented the extreme outer limits of possibilities in the matter.

2628 Q. Physical possibilities?

A. Physical possibilities of discharge in a total volume of 3,000 second feet days, being the extreme outer limit. I say anything reasonably conceivable of occurrence would fall inside of it. From that standpoint, it was not merely of general, but of special interest.

Q. What would be the volume of this rectangular wave?

A. 3,000 second feet days in the form I studied the situation and in the form I requested Professor Thomas to study and test it.

Q. That is meant that the wave was of a duration of that amplitude?

A. It was of that duration with an amplitude of 9,000 second feet propagated instantaneously and continuing throughout eight hours and then dropped to zero instantaneously. Practically that sort of thing does not occur.

Q. What was the respective duration of the discharge represented by the form of the discharge shown in Exhibit 594, and the form of discharge shown by rectangular block wave?

A. The latter, the block form, discharged from Radford station would have a duration of eight hours and that form represented in Exhibit 594 has a duration of 16½ hours.

By Mr. **Jackson**:

Q. Col. Scheidenhelm, are you familiar with what has been referred to in this case as the 1930 wave tests?

A. I am very familiar with them.

Q. Will you please state if you know the circumstances under which those tests were made, including your relation, if any, to the tests?

A. In order to understand how that series of tests of power waves or power tides from the Buck and Byllesby station came about, it is well to refer to the fact that beginning with the making of Declaration of Intention on the part of the Appalachian Electric Power Company in respect of the Radford project, various studies were made from time to time by the United States, District Engineers Office, at Huntington, and to some extent presumably by the Federal Power Commission, with regard to the fluctuations which existed or took place in the flow of New River, due both to the routine peak carrying operations of the Buck and Byllesby hydro stations and the natural fluctuations in New River due to rains.

2629 Those studies of the Engineers Office at Huntington cover various periods of time in the years 1925 to 1927, and perhaps later. The studies themselves, I think, did not begin until 1926, but the first periods studied in 1926 were those of flows which actually occurred in 1925. After each of these studies, there were conferences on my part with representatives of the United States Engineers Office at Huntington, and consideration was given to the results. Each time the attitude of the Huntington office was essentially to the effect, in statements to me, that the results are inconclusive. That condition carried on for several years, and with a view to doing something which would be constructively and positively helpful in solving the problem which appeared to be troubling members of the staff of the Federal Power Commission, I proposed a series of tests which went far beyond the routine operating variations out of the Buck and Byllesby hydro stations. That resulted in the so-called 1930 power wave tests.

Q. Describe briefly how those tests were made?

A. Those tests were accomplished by having the Power Company in effect turn over to me the operation of th' Buck and Byllesby hydro stations, including power plants and reservoirs. In order to obtain variations in discharge from those hydro stations greatly in excess of the natural power station discharges, it was necessary to use, and there were actually used, the spillway crest gates and the pondage of the Byllesby and Buck reservoirs. Water was allowed to be stored back of the Byllesby crest gates until, in most cases, there was actually some flow over the tops of the gates. The same was done in the case of the Buck station. In the meantime, there was no operation of the power station, so that the stream flow downstream from the power station was as low as was permissible, without interfering with the needs of a certain riparian owner. That riparian owner was National Carbide Company, or, possibly, National Carbide & Carbon Company, which had a plant located just a few miles downstream from Byllesby and Buck. These water requirements were met through the tests; but, with the exception of that particular item, the discharge was withheld until both ponded over top.

2630 When that point had been reached, then, as nearly simultaneous as possible, the power station at Byllesby was put into full operation, and the crest gates on the spillway of the Byllesby station were opened, thus releasing a tremendous wave or discharge of water, which very soon found its way into the Buck pond, and, when that wave reached the Buck dam and power station, then, as nearly simultaneous therewith as possible, the Buck station head gates were opened and the spillway crest gates of the Buck dam were opened. Thus the combined capacity of the two power stations and their spillway gates discharges were utilized to create as great discharge as possible.

Q. What was the maximum discharge during those tests?

A. The discharge reached a maximum, of course, at the Buck power station or just at the foot of the Buck development. At that point there were no reliable means of measurement, but at the Ivanhoe gaging station, located two or three miles downstream from the Buck station, it was possible to measure amplitude.

Q. Will you state what was the maximum discharge during your tests, first, as shown at Ivanhoe?

A. At Ivanhoe the discharge reached a maximum which, I believe, was a little short of 14,000 second feet. In my opinion, at Buck station the discharge must have reached an amplitude in second feet somewhat in excess of 15,000.

Q. Were these tests carried on in cooperation with anyone by the power company?

A. They were carried on in cooperation with the United States Engineers' Office at Huntington, with two District officers of the Water Resources Branch of the United States Geological Survey, and with the staff of the Federal Power Commission.

Q. What part, if any, did the representative of the Water Resources Branch of the United States Geological Survey take in the tests?

A. The District Engineer for Virginia, Mr. Dirzulaitis, co-
operated by installing temporary automatic recording
2631 gages, in rating or re-rating various gaging stations, and
in taking off the charts and computing estimates of discharge in the light of those charts. Similar cooperation was rendered by the Geological Survey District Engineer for West Virginia, Mr. Kessler, whose headquarters are at South Charleston, West Virginia.

Q. What was the relationship of the United States District Engineer at Huntington to the tests?

A. The tests were planned in thorough cooperation with his office and in personal conferences with him and his staff.

Q. Who was the District Engineer at that time?

A. Lieutenant Colonel Ardery, now Colonel Ardery.

The District Engineer instructed the personnel along the river to make special frequent gage readings at most of the locks and dams, and, for that purpose, I believe supplied some special personnel. Also, careful observations were ordered to be made, and were made, of all of the dams, including the wicket performance, and of course, the records of the maneuvering of the wickets at each of the eight wicket type dams which were then in existence.

Q. You say there were eight wicket type dams then in existence?

A. Yes.

Q. Were dams 2 and 3 then in existence?

A. They were then in existence. They were of the fixed type.

Q. What was the relationship, if any, of the Federal Power Commission, or its agents, to the tests?

A. The tests had been discussed in personal conference with the then Chief Engineer of the Commission, Lieutenant Colonel Max Tyler, who had just been nominated Brigadier General of the Corps of Engineers.

During the tests there was sent to observe a member of the Engineering staff, Mr. N. B. Keeler, who was present during a part of the time on Kanawha River.

Q. State whether or not these tests were made directly under your supervision?

A. They were. I had general charge of the operations, and of course I kept in touch with the system operating staff of the
Appalachian Electric Power Company as the power sta-
2632 tion had to come on suddenly, and at times when the sys-
tem operating force needed to know such was going to happen in order that they might be prepared to absorb the power outputs of the Buck and Byllesby power stations because, perforce, the operation of the power stations was conducted solely for the best interests of these tests and not as the stations would normally be operated. That is, sometimes the discharge from Buck and Byllesby plants occurred at nights, at times when otherwise there would not be any special heavy output from the power station. I had an assistant in charge of the test operations at the Buck and Byllesby power stations, and another assistant in charge of operations at the navigation dams along Kanawha River.

Q. Was the discharge at Buck and Byllesby limited to the capacity of the power stations?

A. It was by no means limited to such capacity.

Q. Colonel, please state the results of the 1930 wave tests, so far as concern the action of the waves or power tides in their travel down-stream?

A. The outstanding result of the tests was a substancial reduction in the amplitude of flows of the tides from the amplitudes as they obtained in passing Ivanhoe gaging station until, when those tides or waves reached the Kanawha River, they were essentially minor in amplitude. Also, there were substantial reductions in volume of the waves. The precise amount of this reduction is rather difficult of determination because of certain gaging station characteristics, but the amplitude in feet or stage is not subject to any complication, and that involved very definite and very extensive reduction from Ivanhoe down to Kanawha Falls and to the several locks down-stream on the Kanawha until the waves became undistinguishable.

Q. Did any of these power waves or tides increase in amplitude at any point of their travel downstream?

A. I am not certain that any increase in amplitude in second feet took place, but it is not unlikely that there were some minor increases in amplitude within the first 20 or 30 miles of travel of the tides down-stream from the Ivanhoe gaging station, but once that distance had been traversed, the reduction in amplitude became marked and continuous.

Q. Assuming there was a small increase in amplitude, say a short distance below the point of discharge, what, if any, significance would that fact have on the questions which you were considering?

2633 A. On the questions which we were then considering, it had no significance because the important question was what would be the result of those power tides after they had traversed the distance of ordinarily 200 and 300 miles—namely, what was the result in the Kanawha River.

Q. Was there any effect on the power tides by in-flow as they passed downstream?

A. Yes, During the period of the tests, there were various natural tides resulting on the main river and on tributaries, so there were various complicating in-flows which affected and in some cases augmented the power tides.

Q. How far downstream could these power tides be detected?

A. They were all distinguishable as far down-stream as Lock No. 5. A few were distinguishable as far downstream as Lock No. 9. Others were not. None of the waves were distinguishable at the last lock on Kanawha River, No. 11.

Q. Did you state the fact with reference to the condition at Lock 9, or not?

A. I do not recall at this moment. I have the impression—I think I had better refer to my record in that respect.

Q. Here is your record (handing same).

A. I misstated the conditions in respect of Lock 9. I was in error in stating that any waves were distinguishable at Lock 9. At least, that is the extent of such records as I have, and it is true equally of Locks 10 and 11.

Q. Colonel Scheidenhelm, I show you a chart, which is in evidence as Government Exhibit 143, and ask you whether you are familiar with that chart?

A. I am.

Q. State, if you know, whether that chart shows all of the operations, or maneuvers, of the dams during the wave tests?

A. It does not.

Q. Is it substantially complete in that respect, or not?

2634 A. No, It is very incomplete. There are a few maneuvers indicated, but by far the greater number are not indicated thereon.

Q. During these wave tests, did the wicket operations affect the volume and amplitude of the waves shown on that chart?

A. They did.

Q. Will you state why and how that was?

A. Well, as wickets are lowered at a moveable type of dam—that is at a wicket type of dam—the result is to release water from the pool controlled by these wickets, and, therefore, is augmented the flow which would otherwise obtain past the dam. If a wave or tide happened to be passing that particular dam, then there is contributed into the volume of that wave a part of the pond capacity of that particular pool. Conversely, if wickets are raised, then there is subtracted something from the volume of a passing wave, but there is a change in gage reading of the pool level, such as to distort what otherwise would be the conditions obtaining at that site. It may result in an increased amplitude reading in terms of stage.

Q. State, if you know, whether the hydrographs of the 1930 wave tests, insofar as they disclosed any amplitude in second feet, are based upon a single rating curve?

A. For each gaging station there was applied only a single rating curve.

Q. What, if anything, is the effect of that circumstance with reference to the degree of accuracy of the readings of amplitude and volume in second feet?

A. The necessary consequence is that there was not taken into account the effect of rising and falling stages. The rating curves

are generally applicable for conditions of steady flow, but there were natural changes in flow taking place in both New and Kanawha Rivers throughout the 300 miles of this full size laboratory, and, in addition, the very power tides themselves meant rising and falling stages. That is axiomatic of a power tide or wave, and the various discharges corresponding to a given gage height, could not be reflected by the use of a single rating curve for a given station, as was actually done. In consequence, the hydrographs contained in them errors as to the magnitude, of
which we have no precise knowledge, but can make esti-
2635 mates, if necessary, though I would hesitate to do so; but
we do have knowledge that on ascending and descending
stages they are not correct.

Q. Are those errors in hydrograph applicable to stage as well as volume?

A. They are not applicable to amplitude in stage, but merely in terms of discharge, or in terms of volume, because a function of volume is the amplitude in second feet, namely, in flow.

Q. You have already stated that during these wave tests there were substantial reductions in amplitude in second feet, as the waves passed downstream? Will you state whether there were reductions in amplitude expressed in feet of stage as the waves passed downtream?

A. There were very great reductions in feet of stage.

Q. Can you give some examples of that from the records of the tests?

A. Yes. The greatest amplitude of a wave in stage was apparently that of a wave which for convenience we numbered #15 at Ivanhoe as this wave came by the water rose practically seven feet in a very short period of time. By the time that wave had reached Lock #2 it had decreased in amplitude to five inches. The least amplitude in inches of any wave was in the case of #16, which had been propogated in somewhat similar fashion. In that case the amplitude at Lock #2 was three inches. However, those were especially peak waves which were of high amplitude in second feet, and by reason of the limitations in water supply were not of great duration.

Q. You mean high amplitude in second feet or in stages?

A. Both.

Q. In stating these amplitudes in stage, as I understand it, you are again stating the amplitude in stage at Ivanhoe station and not the point of discharge at Buck dam?

A. That is true. At Buck discharge must have been greater.

Q. What was the greatest amplitude in stage of any of the test waves at Lock #2?

A. It was approximately nine inches in the case of wave #6, hich had had an amplitude in stage of four feet eight inches at Ivanhoe. However, that maximum amplitude at Lock
36 #2 was in my opinion affected by a rain inflow. I do not know to what extent its amplitude was increased because f a natural increase locally in the Kanawha or from some earby tributary, but it did affect it somewhat.

Q. Referring to wave #4 of these tests please state the amplide in stage at Ivanhoe and at Lock #2.

A. At Ivanhoe the amplitude was approximately four feet. t Lock #2 it was approximately six inches.

Q. Please state the amplitude in stage for wave #10 at Ivane and at Lock #2.

A. At Ivanhoe it was approximately six feet. At Lock #2 it as approximately seven inches.

Q. Please state the average reduction in amplitude measured stage for all of the waves of the 1930 wave tests between vanhoe and Lock #2.

A. For the eighteen waves the average amplitude at Ivanhoe as about five feet three inches. At Lock #2 the average amplide was about five inches. I might say that the amplitude in age as I have given them in figures represent the vertical distance between the crest of the wave and the base flow, as reprented in turn by a straight line connecting the lowest points troughs on either side of the wave crest.

Q. Were there any complicating conditions during the 1930 ave tests?

A. There were the conditions of rains which caused natural hanges in flow in New River and in Kanawha River and various ibutaries. There is hardly any, if indeed any, wave of the vies that was not so affected.

Q. State whether any of the power tests, or waves, which me into the Kanawha River during the 1930 wave test, as a sult of those wave tests, caused any interference with navigaon on the Kanawha River?

A. They did not.

Q. Col. Scheidenhelm, what, if any, investigation did you make f the results of these waves on the Kanawha River during the 1930 wave test?

637 A. Well the object of the series of tests was not merely to propagate the waves or tides, but to find out what they ould do. Now it was manifestly impossible for anyone individl to be everywhere at the same time, but I had observations ade everywhere; they were reported to me. My assistants reorted directly. I conferred with the representatives of the

District Engineer office and the District Engineer himself, and I am as certain of the results of that particular investigation as I would be of any other engineering investigation which I would be called on to make, and as a result of which to make a finding for myself.

Q. Colonel Scheidenhelm, state whether or not these tests were made under your supervision and direction.

A. They were, entirely so.

Q. State whether or not you have studied and examined the records of the conditions produced by these waves as they passed through the Kanawha River.

A. I have done so in respect to both changes in elevation of water in the respective pools and as regards the maneuvers of the wicket gates in the cases of the eight movable dams.

Q. Please state whether any of the power tides or waves which came into the Kanawha River as a result of the tests of March, 1930, caused any interference with navigation on, or the navigable capacity of, the Kanawha River?

By Mr. Thompson. I object.

By the Court. Objection sustained.

By Mr. Jackson. Exception. May I ask if that is on the ground of the form of the question or ground of incompetency?

By the Court. Ground of competency. He has recited all the facts he knows about it, and you have the testimony of other witnesses in here, the Government agents themselves who were down there when the waves came down, and who said it would not interfere.

By Mr. Jackson:

I realize it is cumulative, your Honor.

Q. Please state, Colonel Scheidenhelm, whether in your opinion, any of the waves produced by the 1930 wave tests, in passing through the Kanawha River, caused any interference with navigation on, or navigable capacity of that river.

By Mr. Thompson. Same objection.

By the Court. Objection sustained.

By Mr. Jackson:

Exception.

Q. What were the character of the changes, if any, in stream stages on the Kanawha River navigation pools during the wave tests of 1930?

A. The characteristic was the minor extent of the variation and the gradual manner in which those variations occurred. One could stand for hours along the navigation pools and not be able to observe any change except as after awhile the gauge revealed it.

Q. What would be the effect, if any, of changes in stream stage of that nature on the navigation pools on the Kanawha River, on the operation of a boat?

By Mr. THOMPSON. I object to that. It is getting around to the same question.

By the COURT. Objection sustained.

By Mr. JACKSON. Exception. Is that on the form of the question or competency of the witness?

By the COURT. I expect it is the competency of the witness. Most anyone could tell what effect it would have on a boat as well as Col. Scheidenhelm.

By Mr. JACKSON:

Exception.

Q. Colonel Scheidenhelm, are there any natural tides in New River?

A. There are. Not at this moment perhaps, but they are natural phenomena on New River.

Q. Will you explain what you mean by that?

2638 A. Well rain tides come in which have much the same characteristics as power tides for illustration, and they occur from time to time with varying degrees of intensity. If there is enough rain or melting snow, the tide can take the form of a great flood. There are variations all the way from that down to minor floods or rain tides.

Q. How do natural tides which occur in New River, compare in magnitude with those which were produced by the 1930 wave test?

A. Time and again natural tides occur which substantially exceed in amplitude and in volume any of the 1930 test tides.

Q. State if you know whether the old wicket type navigation dams on the Kanawha River were and are prepared for natural fluctuations of a magnitude greatly in excess of the fluctuations caused on the Kanawha River by the 1930 wave test.

A. They are prepared to cope with the natural tides substantially in excess of the 1930 series, and for that matter they do.

Q. State whether the waves or tides produced by the 1930 wave test would correspond with a substantial degree of peak operation of the Radford project.

A. They would.

By the COURT. I expect you testified about it, but I didn't catch it. For what length of time was this water released during these tests?

By the Witness. Meaning in regard to an individual tide or the whole series?

By the Court. I mean an individual tide. If you wanted to create a water tide down the river how long would the water run up at Buck dam for an individual wave?

By the Witness. (After referring to notes and exhibit.) Exhibit #227 is one which shows the duration in point of time at Ivanhoe.

2639 I do not believe I have with me the precise time of release of the water at Byllesby and Buck, respectively, but they approximate those stated for Ivanhoe. In the case of wave #1, reading the chart by inspection and without scale, it looks like six or seven hours of duration for the #1 wave, or perhaps eight hours, and #2 about the same. When it came to the higher tides, however, the capacity of the Byllesby reservoir was not such as to permit the discharge of the water for so long a period, and they reached a maximum, which was always a point, and then decreased, that is why I said that in the case of the waves which had the maximum amplitude Nos. 15 and 16, and maybe 14–a, that they were not what I would style typical—I doubt if there is anything strictly worthy of the name typical in the series, because there were varying conditions throughout, but certainly those which were released at intervals of about eleven hours were hardly typical of anything that later could occur at Radford, but as to the earlier ones which had durations of from six to eight hours, and some of the others of lesser duration, their maximum amounts were more nearly those that would be typical of conditions at Radford. Have I answered the question?

By the Court. I think so.

By Mr. Jackson:

Q. Colonel, to what extent, if at all, have you made any study of the possibility of causing any interference with the navigable capacity of the Kanawha through operation of the Radford power plant or any other power plant up-stream from Kanawha River?

A. I have made extensive studies over a series of years.

Q. And what was the purpose of your studies or the occasion for them?

A. Primarily to determine what should be my advice to the client as regards the safety of constructing and operating power developments which might conceivably be concerned with the conditions on the Kanawha River.

2640 Q. Assuming the Radford project to be in operation and the physical conditions with reference to the navigation structures on the Kanawha River to be the same as those existing at the time of the 1930 wave tests, in your opinion would it be possible for the Radford project to operate according to some peak carrying method without causing interference with the navigable capacity of the Kanawha River?

A. It would.

By Mr. JACKSON:

Q. Col. Scheidenhelm, assuming the conditions on the Kanawha River with respect to structures, navigation dams and the like, to be the same as those which existed during the 1930 wave tests, state whether, in your opinion, a substantial peak operation of the Radford project would impair the capacity of the Ohio River?

A. It would not.

By Mr. JACKSON. The question was amended to include "navigable capacity", as the Court suggested.

By Mr. JACKSON:

Q. State, if you know, whether the wicket type dams will be in the Kanawha River when the Radford project is completed and ready for operation?

A. They will not.

By Mr. JACKSON:

Q. Would the possibility of affecting navigable capacity of the Kanawha River by any method of operating the Radford power station be greater or less after all of the wicket type dams on the Kanawha River have been displaced by the roller gate dams?

A. Any such possibility would be less after the new Kanawha Roller type dams are in place, including the Gallipolis dam on the Ohio.

Q. Are you familiar with the London dam?

A. Yes.

Q. State whether there is any pondage at that dam?

A. There is.

Q. How is it utilized?

A. There is an available pondage of three feet in depth between elevation 614 and 611 above mean sea level, and it is utilized in routine operation by the Kanawha Power stations of the Kanawha Valley Power Company.

2641 Q. How much pondage is available at London dam?

A. In the neighborhood of 2,700 acre feet, probably something more.

Q. You say there is three feet pondage. What is the elevation of the upper and lower limits of this pondage?

A. The upper is at elevation 614 and the lower at elevation 611.

Q. Do you know where the head of navigation in the project on the London pool is located?

A. Yes, it is at Mile 90.57, above the mouth of the Kanawha.

Q. State, if you know, whether the project depth remains at the upper end of the London pool when it is drawn down to elevation 611?

A. When the pool is drawn down to elevation 611 there is still at least the project depth of 9 feet at the head of navigation.

Q. What, in your opinion, is the importance, if any, of the London pondage as regards re-regulation of fluctuating flows from up-stream?

A. It is important in that it can do it. It is important that it can do it to a substantial degree. In my opinion, it can re-regulate any power tides which conceivably can be propagated at the Radford power project by means of the installation proposed there.

Q. Disregarding the three foot draw down in the case of the London Pool, state, if you know, whether the Kanawha navigation pools are kept at precisely constant levels?

A. They are not.

Q. What is the extent of the variation?

A. The variation is different in degree and in time of occurrence. There is nothing regular about them. In the case of the Kanawha pools the variations have occurred.

Q. Which Kanawha pools do you mean?

A. In the case of the Marmet pool the variations are several inches above the pool level and several inches below. By understanding with the United States District Engineer Office, the variation below pool level is being limited to a .3 of a foot. The limitation I am referring to is the limitation on the part
2642 of the operators of the power stations at London and Marmet stations. However, there are variations which result from the plain inability of operators at Locks and dams, regardless of power stations, to keep the pools absolutely level.

Q. As a matter of practical operation, will there be any fluctuations of a similar character in the Winfield and Gallipolis pools when they are completed?

A. Necessarily so.

By Mr. **Jackson**:

Q. Are you familiar with the dams on the Kanawha River?

A. I am.

Q. How long have you been familiar with them?

A. Something like ten years.

Q. Have you seen them from time to time, or not?

A. Yes.

Q. Have you observed their operation?

A. Yes, I have observed their operation and their records, both, as I have them at the office, as they are in the District Engineer's office, and as they are contained in the Lock Master's Offices at the several locks and dams.

Q. I will ask you what are the present conditions as regards variation of pool levels in the cases of pools formed by the wicket type dams still remaining in the Kanawha River?

A. Speaking of the pools generally, that is, without reference to any individual pool, the variations in head water at the given lock and dam, are normally over a range of 18 inches to 2 feet, although there are occasional variations which are substantially greater, especially in the upper direction. The wicket type dams in their operation necessarily result in a dropping of the pool level when the wickets are lowered and that may be to the extent of one foot or more below the pool level as and immediately after the wickets are dropped. On the other hand, wickets once up are not thereafter dropped as a matter of operating practice until the depth of water over the top of the wickets approximates one foot. So far I have referred to the variations 2643 of the head water at the dams in the general case. At the upstream ends of the pools there are still greater variations because of the back-water effect.

By Mr. Thompson:

Q. You mean by head water, the upper end of the pool, do you?

A. By head-water I mean the upper level of the water at a given lock and I am referring to it adjacent to the dam and lock, so to speak, and not at the upper end of a given pool, but I did refer to the upper end of the given pool and stated that there the back water effect comes into play and there are still greater variations. In the case of that wicket dam pool which is immediately down stream from the Marmet dam, the variations at the downstream end of the pool, that is, the head-water at Lock and Dam #6, does not differ in its performance substantially from what I have related as an average condition at the existing six wicket type dams, but at the up-stream end of that pool the variations due to the operation of the Marmet power station result in variations which, in amplitude, are greater than probably exist at the downstream dams in respect of the up-stream ends of their respective pools.

A. The variation in the head of the #6 pool is the same as the variation in the tail-water of the Marmet Power Station and the variation there extends to approximately 3 feet above the #6 pool level. I am referring to a variation caused by the power station.

By Mr. JACKSON:

Q. Please state what, if any, effect these fluctuations in pool levels of the London and Marmet pools and future Winfield and Gallipolis pools will have upon any fluctuating flows into those several pools? 2644

A. I have referred to two kinds of variations, one of a few tenths above and below the pool level, and the other variations being of the order of several feet in the wicket type dams. Am I to understand that counsel's question refers to those of several tenths above and below the normal pool levels?

By Mr. JACKSON:

Q. Yes, it is confined to the London, Marmet, Winfield and Gallipolis pools?

A. In that respect the result will be to even out any fluctuating inflows into any of the given pools, and to reduce the variations of out flow as compared with the variations in inflow.

Q. State to what extent, if any, in your opinion, these fluctuations last described by you would re-regulate any conceivable power tides from the Radford power station?

A. In my opinion it would even them out to such an extent that the flow passing the Gallipolis dam could not reveal any variations due to variable inflow into the London Pool and that might, and probably would, be true in the case of the Winfield dam and, to a lesser extent, in the case of the Marmet dam. One can't tell precisely at what point the variations would become indistinguishable but by the time the relatively large pool areas of the Winfield and Gallipolis dams are brought into play and the very minor fluctuations in those pools taken into account, there can, in my opinion, be no residual variation from any power tide which the Radford project could conceivably cause in the London pool.

By Mr. JACKSON:

Q. What, in your opinion, will be the effect, if any, of the operation of the London, Marmet and Winfield power stations upon any power tides that might reach the Kanawha River from the Radford station?

A. The variations in flow through the respective power stations on the Kanawha River, varies to so great an extent that any residual power tides and variations due to power tides from the Radford station simply would not be recognizable and could not have any effect downstream from the London power station.

2645 Q. When you speak of fluctuations in flow caused by the operation of the London and Marmet power stations, can you state how those fluctuations, resulting from the operation of the London and Marmet power stations, compare with any power tides which could conceivably pass into the London and Marmet pools from the Radford station?

A. Well, the upper limit of any power tide from the Radford station would be an absolutely undiminished tide from that station, that is undiminished in amplitude in second feet, something which, in my opinion, is just impossible of occurrence. If it did, it would have an amplitude which would be slightly less than the discharge capacity of the London and Marmet power stations and substantially less than the discharge capacity of the Winfield Power Station. However, the variations which can be due actually, in the London pool, to any power tides propogated at the Radford station, assuming absolutely no re-regulation enroute, or in the London pool, would be of an order of less than half of the discharge capacity and hence of the variations in flow at the London Power Station and the others down-stream.

Q. In the first part of your answer, you said that if there was no change in a power tide between the time it left Radford and reached London Pool. I didn't understand that statement.

A. If there were no reduction in amplitude in a tide with the result that it caused a variation of 9,000 second feet.

Q. In your opinion is it possible for a tide discharged at the Radford Power Station to come down to the London and Marmet pools without any reduction in amplitude?

A. Absolutely out of the question.

Q. In your statements with reference to the comparative potentialities of fluctuations in the London or Marmet pools from Radford power waves and the fluctuations produced by operations of the London and Marmet stations, did you limit your opinion to the amplitude of variations in flow represented by the power tides themselves?

A. When I stated that the variation in discharge out of the London and Marmet and Winfield power stations would 2646 very greatly exceed the possible variations in any power tides from the Radford station, I had in mind the actual variations which might occur, on the assumption, however, of no reregulation either enroute or in the London pond.

By Mr. Jackson:

Q. That is not what I am getting at, Colonel. Are there such things as secondary variations?

A. There are.

Q. I want to know whether in your answer about the comparative fluctuations resulting in these pools, you took into consideration the question of secondary variations?

A. I did not. If I were to make a comparison on secondary variations the ratio would be far different, I think secondary variations would be so insignificant from the power tides propagated at the Radford station that it just would not enter the picture at all, whereas, secondary variations due to the operations of the London, Marmet and Winfield stations would be perceptible, entirely so, as those due to London and Marmet now are.

Q. Colonel, have you made any investigation of leakage through the London or Marmet dams and locks?

A. I have.

Q. What do you estimate the requirements needed to offset leakage at the London and Marmet dams and locks?

A. A total, under present conditions, for the locks and dams at each site of about 40 second feet, not over 40 second feet, per site, probably more nearly 30 or 35 second feet. However, after making some allowance for wear of the seats of the gates at locks and dams prior to a period of renewal or repair, I would say an allowance of 50 second feet should cover the total at each site for dam gates and locks.

Q. Have you made any investigation of the water requirements for lockages at the Marmet and London dams?

A. I have.

Q. What, in your opinion, is the water requirement for lockages at the Marmet dam under present conditions?

A. Not over an average of 50 second feet.

2647 Q. In determining the minimum water requirement for keeping the new navigation pools on the Kanawha River filled, what factors need to be taken into account?

A. The leakage through dams and the lock gates, the requirements for lockages in the sense of emptying of lock chambers, the leakage under or around the dams including the power stations as dam structures, any leakage through the gates, including the turbine gates of the power stations, and evaporation.

Q. Assuming a critical low flow season and no flow allowed through locks, dams or power stations excepting such as is necessary for lockages, what, in your opinion, would be the minimum requirement of water to maintain the new navigation dam pools under present conditions?

A. Between 135 and 150 second feet.

By Mr. JACKSON:

Q. What were the number of lockages last year?

A. May I refer to my data?

A. The total lockages at the Marmet dam for the year ending une 30th, 1936, was 2640, of which close to one-half were lockges for the purposes of dredging operations, which were unsual in quantity. Down to Lock 8——

By the COURT:

Q. What dam?

A. Marmet dam, sir.

By Mr. JACKSON:

Q. You say "unusual." Did that have anything to do with nstruction or not?

A. I cannot say positively that it had to do with construction, ut in my opinion, they were, yes, sir.

Q. Proceed.

A. Now, the total number of lockages does not represent the tal number of emptyings of lock chambers.

It is a common practice of the Engineering branch of the War epartment to assume a figure of .75 for that purpose, that is, assume that, out of the total number of lockages, ¾ths of that umber will be or represent emptyings of lock chambers. Hower, the practice is not the same throughout all the branches of the service, and at the Huntington office, apparently the 648 figure .85 is used for that purpose, and I have so used it.

In consequence, the average number of lockages, without aking any deductions for special lockages on account of dredgng, would have resulted in an average number of emptyings of e lock chambers in the amount practically of Six per day. I ssumed an average of Seven.

Q. What is the volume of water required per lockage per day t the Marmet dam?

A. The volume of water required per lockage per day: The olume of water involved in single emptyings of lock chambers, ith the pools at their normal levels, that is, both head and tail ool, is approximately Six second foot days.

Q. Will you state how many lockages last year were for redging and how many lockages there were for ordinary travel?

A. In that year at Marmet, there were 1,232 lockages for redging; there were 70 lockages on account of construction of e locks themselves, or of the hydro-electric stations, and 1,338 ckages for ordinary traffic.

Q. Assuming the doubling of the number of lockages for last ear, what would be the total requirements, with the other conditions remaining the same—that is, the ones stated in answer—in connection with the previous question to you, to-wit: no flow allowed through the locks, dams or power stations, except such as is necessary for lockages?

A. Doubling all of the lockages, both for ordinary traffic and for special and temporary purposes, I would estimate that the total water requirements for maintaining the pools full, would be between 175 and 200 second feet.

Q. What, in your opinion, would be the reasonableness of assuming the doubling of the lockages for dredging?

A. In my opinion, that is far from reasonable. There is no sound basis for it.

Q. State whether or not, in your opinion, any power tide from the Radford power station will be perceptible in the Ohio River down stream from the Gallipolis dam?

A. In my opinion, it will not be perceptible.

Q. State whether or not, in your opinion, it is reason-
2649 able or unreasonable to assume that the flow past the Rad-
ford dam would be cut off during the low water season for
several weeks or longer?

A. It would be very unreasonable to make such an assumption.

By Mr. Jackson:

Q. Assuming, nevertheless, that the flow of New River at the Radford dam or power station is completely cut off for a period of indefinite length, and that the London, Marmet, Winfield and Gallipolis dams are completed and in operation, in your opinion, would such a condition prevent the maintenance of the navigation pools on the Kanawha River?

A. It would not prevent the maintenance of the navigation pools on the Kanawha River, at their normal level.

Q. And give us your reason——

A. Well, the cutting off of the flow at the Radford dam site completely would, of course, remove the contribution of that portion of the drainage area, and there would remain solely the run-off or contribution from the drainage area downstream from the dam site. Under the lowest bases of estimate of the residuary flow from the down stream area, which would obtain at Kanawha Falls or points down stream, there would be, roughly, twice as much water as in my opinion, would be necessary for maintaining those pools at their levels—at normal levels. In that connection, I am taking into account the average monthly flows, rather than the occurrences of a day or two, because, in such a period, what happens upstream on a given pair of days, for instance, cannot be a true measure of what will happen down-stream on the two days, or in the ensuing two days, even fter making all the allowances for lag. Put in another way, he water that originates upstream, in any given two days, will not n two days pass—will not within two days pass any given own-stream point, as long as there is any variation in flow. ecessarily, if there are any two days, which, on the Kanawha iver are the subjects of estimates of especially low flows, the ows adjacent to these days are greater.

In other words, there is a variation of flow and it is just im-
roper to attempt to match up any two days of the Kanawha
flow, under these conditions, with any two days upstream,
650 and the same is true of any other group of days, until
one gets into a broader area than a few days.

Roughly speaking, throughout the low water period, the minium excess of flow from the drainage area downstream from he Radford project would be on the order of 100%.

Q. Turning from that hypothesis, which supposes the flow cut ff from the Radford plant during the low water season, state n your opinion what would be the actual effect of the operation f the Radford project, as regards the flow in the Kanawha iver, during low water period?

A. It would substantially increase the low water flow into the anawha River.

Q. State whether or not that effect would extend into the hio River?

A. It would necessarily extend into the Ohio River, yes, sir.

Q. Please state what was the flow of Little River at its mouth hroughout the month of October, 1930?

A. (Examines papers.) Based on the estimate of the flow for ittle River, at made by the United States Geological Survey for raysontown, Virginia, for that month, and in the light of my nowledge of the situation generally, I would say that the flow f Little River, at its month—

A. its mouth—throughout October, 1930, approached in the eighborhood of 135 second feet.

Q. Colonel Scheidenhelm, you have expressed a number of pinions regarding the possible effect of the Radford power staion on the Kanawha River. In expressing those opinions, did ou take into account any possible reregulation of the Radford ower tides between the site of the Radford project and the anawha Falls?

A. I did not.

Q. This morning, you referred to what you described as the luestone power project of the West Virginia Power Company. Vill you briefly describe that project?

A. (Witness examines papers.)

A. The Bluestone power project of the West Virginia Power Company, with its two stages of development, named Hin-
2651 ton and Bulls Falls, respectively, would have installations
as follows:

At the Hinton development, 22,500 kilowatts or 31,500 horsepower. At the Bulls Falls development, 120,000 kilowatts, or 170,000 horsepower. That is, the total installation in the two stations, in the terms of horsepower, would be 200,000 horsepower.

The Bulls Falls development is intended to empty into the Hinton reservoir—that is, empty the power discharge of the Bulls Falls power station into the Hinton reservoir, which reservoir is to have a fluctuating water surface and relatively uniform discharge.

In other words, the Hinton development is intended to be a reregulating development. The Bulls Falls development is a combined storage and power development.

Q. Why did you recommend this form for that project?

A. Because in the case of a large power development, with great capacity, located at the head of a very steep portion of the river, and in proximity to downstream riparian owners, and in proximity to navigation works on the Kanawha River, as they existed at that time—at the time that I made the recommendation, it was my opinion that the West Virginia Power Company should not take the risk of being subject to liability for interference, or claims for or liability for interference with these riparian rights or with the navigation structures on the Kanawha River.

Q. As I understand you, this has been changed, under your supervision, from an earlier project of single stage to two stages?

A. That is true.

Q. Was the change from the single to the two stage development of the Bluestone project, brought about or affected in any way, by any proposed method of construction of the Radford project?

A. It was not.

Q. What is the present status of the Bluestone project of the West Virginia Power Company?

A. The status of development or the progress in the direction of consummation is, that the West Virginia Power Com-
2652 pany owns the dam sites and owns lands and rights of
approximately one-fourth of the total necessary. In 1929 and 1930, steps were taken, by way of intensive explorations and planning, looking towards early construction, and previously pending application for a license before the Public Service Commission of West Virginia, on the part of the West Virginia Power

Company was amended so as to cover the change from a single high dam development to the project that is shown on Exhibit No. 600.

That Application was pending before the Public Service Commission of West Virginia for some months; hearings were held but before the Commission made a decision with respect to the issuance of the license the Supreme Court of Appeals of West Virginia declared unconstitutional that Act under which the Public Service Commission of West Virginia was operating, in respect to water power development.

Q. State if you know whether or not this Bluestone project of the West Virginia Power Company is still included in the plans of the defendant and its affiliates with the developing of power stations on New River?

A. Yes, sir. The only condition under which I can conceive that it could not be brought into being, would be for the Bluestone reservoir project recommended by the Chief of Engineers, or some other form which might be approved by Congress, to be constructed.

Q. From the standpoint of any possible effect of the Radford project or the effect of the Radford project on the development of the Bluestone site, does it make any difference whether or not the so-called Bluestone project be constructed in accordance with the plans of the West Virginia Power Company, or in accordance with the plans which have been set out by the Government, in Exhibit No. 145?

A. I believe it makes no difference in respect to the effect of the Radford project on the Bluestone project, if I understand the question correctly.

Q. Yes, sir.

By Mr. **Thompson**. What do you mean by that? The
2653 effect so far as the flow of water is concerned, or whether or not you go ahead with the Radford project?

A. I assumed the question to mean an effect upon the operation of the Bluestone project.

By Mr. **Jackson**:

Q. What I want is whether or not the effect upon any possible power tides from Radford will be materially different, if the so-called Bluestone project be constructed in accordance with the plans of the West Virginia Power Company, instead of in accordance with the plans of the Government, as shown in Exhibit No. 145?

A. That puts the situation in the converse of what I understood the situation to be. My answer is, in that latter respect, the effect of either the Bulls Falls development of the West Virginia Power

Company's Bluestone reservoir project, or the Bluestone project of the United States, will each have the same effect upon the power tides from Radford.

Q. What will that effect be?

A. That effect will be essentially to make them lose their identity; in effect, to re-regulate these power tides so that they will not be recognizable and not appear as such down stream at Bulls Falls or Bluestone dam respectively.

Q. Are you familiar with the revised plans for the Radford project, shown in Government Exhibit 90–A?

A. I am.

Q. State whether or not the Radford project is now being constructed in accordance with those plans?

A. It is.

Q. I think you have testified that you are familiar with the power developments at the Government navigation dams on the Kanawha River?

A. Yes, sir.

Q. In your opinion, what, if any, effect will the construction and operation of the Radford project have upon the value of the power of the Government navigation dams on the Kanawha River?

A. Its effect will be beneficial upon the value of the power.

By Mr. **Jackson**:

Q. Assuming the Government constructs the Bluestone project, what effect, if any, will the construction and operation of the Radford project have upon the value of the power to be developed at the Government Bluestone project?

A. In my opinion, it will have a very substantial beneficial effect upon that project.

By Mr. **Thompson**:

Q. That Radford will have on Bluestone?

A. Yes.

Q. Will you give your reasons, please?

A. The principal element affects both the Bluestone reservoir project power and the Kanawha River navigation dam power, and that is the increase in the low-water flow at each of those sites. The increment in flow being roughly 600 second-feet over the low-water flow at Radford is a constant increment, and it has a larger ratio to the low-water flow at the Bluestone site than to the flow of Kanawha River at the several navigation dams. Therefore, the proportionate benefit will be greater at the Bluestone site than downstream, but in each case it will be beneficial.

The increase in low-water flow, however, is not the only benefit. The fact that the Radford storage reservoir would be filled out of high flows and flood flows means that to that extent there will be less water in floods at points downstream. That has no great bearing on the power available to be developed at the Bluestone site, but it does have an effect at the navigation dams. That is because the power stations at the navigation dams are all relatively low head, and from time to time the head becomes such as to put the power plants out of operation—that is, when the head drops sufficiently, the power stations at London, Marmet, and Winfield cannot or will not be able to operate, and the period of outage will be decreased by reason of the waters put into storage from time to time in the case of the Radford development.

By Mr. **Thompson**:

Q. That was on the assumption that the Bluestone was not built?

2655 A. The statement holds good as I have sought to distinguish it, regardless of Bluestone—that is, the storage of Radford is effective with regard to the Kanawha navigation dams, whether or not there is a Bluestone development.

By Mr. **Jackson**:

Q. State, if you have not already covered that, whether the Kanawha Valley Power Company relies upon capacity in the terms of power installation of the London and Marmet projects during low water flow?

A. Of course the Kanawha Valley Power Company does and it has been able to enter into a contractual relation with the Appalachian Electric Power Company in the light of that condition.

Q. You just stated in times of high water, I believe, that these power stations at London and Marmet are temporarily out of service; that is right; isn't it?

Q. Temporarily out of service during certain high water conditions. I might add that their capacity is reduced at lesser high flows, even though they are not completely out of operation. Any rise in tail water of those stations cuts down the head, and, therefore, the power capacity at the Kanawha navigation dams.

Q. Well, when high water obtains on the Kanawha River to such extent as to temporarily prevent the operation of the London and Marmet hydroelectric stations, what would be the probably condition of power availability at the Radford station?

A. At that station the probability would be a relatively high flow, and, therefore, a relatively greater available power output.

Ordinarily, under those circumstances, the reservoir would be full and the station could be running to the full capacity of 9,000 second-feet or 10,000 second-feet without any wastage. To be sure the tail water at the Radford development would rise somewhat, but that rise, compared with the total head, is minor and would be far more than offset by the increase in the available flow through the power station.

Q. Would that permit the Radford station to make up any substantial part of the power loss by reason of the London and Marmet stations being out of operation?

2656 A. It would serve as a general effect in respect of loss of power supply at that particular time for the system as a whole.

Q. State whether or not what you have said about the operating limitation of the London and Marmet power stations will be applicable to the Wingfield station?

A. That will be essentially so.

Q. Col. Scheidenhelm, in your capacity as Consulting Engineer for the Radford project, did you have anything to do with the determination of what lands and the extent of lands which should be acquired?

A. Yes, I advised throughout in that respect after I became identified with the company and the project, about 1925.

Q. Have your duties as Consulting Engineer required you to maintain familiarity with the amount of land required for the project?

A. Yes.

Q. Will you please state how much land has been acquired by the defendant for the Radford project—just in round figures?

A. The company has acquired all of the land to be overflowed.

Q. How much is that?

A. That totals approximately 5,000 acres.

Q. Will you state, if you know, the cost of acquiring these lands and property rights to the defendant?

A. I do not know the precise amount, but it is over one million dollars.

Q. Has anything been spent in exploratory or other work preparatory to construction?

A. Yes, substantially over quarter of a million dollars have been spent for that purpose under my direction.

Q. Has anything been spent on construction?

A. Yes.

2657 Q. How much, approximately?

A. I am not familiar with the details in that respect, but I know it is again substantially in excess of a quarter of a million dollars—probably nearly half million dollars.

Q. Will you state, if you know, what was the purpose of expenditure in acquiring these lands on which the Radford project is being constructed?

A. The object was to acquire them for that particular power development.

Mr. **Thompson**. Is he speaking as agent or representative of the company, or as Consulting Engineer?

Mr. **Jackson**. As Consulting Engineer.

Mr. **Thompson**. In buying land.

By Mr. **Jackson**:

Q. Please state, if you know, whether the defendant has any use for the land so acquired other than for the development of this water power?

A. It has not.

Q. Have you ever made any appraisals of hydroelectric power sites?

A. I have.

Q. Have those appraisals included the valuation of lands used or suitable for use for the development of hydroelectric power?

A. They have.

Q. In the course of your professional work, have you had any occasion to make any such appraisals for banking or investment houses?

A. Yes, sir.

Q. And in the course of your professional work have you become familiar with the values of lands adapted for development of water powers?

A. I have, in the cases of individual developments and in the broader sense have become familiar with the values of power sites as such, including the lands and rights comprising them.

2658 Q. What effect, if any, in your opinion, would be the inability of the defendant to develop its property at the Radford site for water power purposes, without subjecting the property to recapture by the Federal Government, under the terms of the Federal Water Power Act, and without subjecting the operations to the other requirements of the Federal Water Power Act, have upon the marketability or value of the property now owned by the defendant at the Radford dam site?

A. In my opinion it would substantially reduce or depreciate the value, and because of that would undoubtedly affect the marketability of the lands for the purpose of power development.

Q. Col. Scheidenhelm, are you familiar with the plans for the Government Bluestones project as they are set out in Government Exhibit #145?

A. I am reasonably so.

Q. Please state whether those plans do or do not provide for any peak load operation of the Government Bluestone power station?

A. In my opinion the description of the proposed operation of the power portion of the Bluestone reservoir project necessarily imply substantially peak carrying operation.

By the COURT. It is a fact this Bluestone project contemplates the regulated flow of not less than 2,000 feet a second. Does that in any way interfere with or modify its operation for power purposes.

By the WITNESS. My opinion, as expressed in my previous answer, and as bearing upon the answer to your Honor's question, is affected largely by the statements contained in paragraph #65 of page 116 of House Document #91. If the words "minimum regulated flow of 2,000 cubic feet per second" stood by themselves one could not tell whether or not it was contemplated the flow would be uniformly 2,000 second-feet throughout the low water season, or whether there was involved some degree of variations within a day or a week, or otherwise, but maintaining the average of 2,000 second-feet through the day or otherwise—my interpretation of that particular paragraph of the report is that it contemplates a variation at least within the twenty-four hour period. The wording there is very clear in its significance to me in that respect, but I am not ready to say it contemplates a variation outside of a given twenty-four hours. That might or might not be the case.

2659

By the COURT. It seems to me the Radford project and the Bluestone project, from the standpoint of operation for power purposes in the nature of the load they will carry, are essentially the same kind of project, both with a high head, and look to me as though they would be operated the same way and meet the same demands, excepting insofar as this regulated flow of not less than 2,000 second-feet might affect that. Hasn't it been testified here it is contemplated at Bluestone there would be an installed capacity of something like 10,000 second-feet?

By the WITNESS. 11,000 under maximum flow conditions.

By the COURT. All right, that would indicate to me it was exactly the same sort of power development that would be operated at Radford, substantially the same, and carry the same sort of general scheme of an electrical power system. I am wondering how far that is affected or modified by the requirement for regulated flow of not less than 2,000 second-feet?

By the WITNESS. If it were specified that that regulated flow should be uniform then that might be controlling, but it would be inconsistent from the technical engineering standpoint, with

the statements made elsewhere in the report and in that particular paragraph on the question of uniformity or variability of discharge from the power station, but there are various statements in paragraph 65 which lead me to the inescapable
2660 interpretation for myself that the operation of the plant
is intended to be on a varying basis, such that approximately two-thirds of the total output would be developed within one-half of the twenty-four hours of the day, and the remaining one-third within the other one-half.

Q. When you refer to paragraph 65 is that on page 116 of Exhibit #145?

A. Yes, sir.

Q. I want to invite your attention to statement on pages 2 and 3 of Government Exhibit #145 (reading): "On the New River and its tributaries the plans provide for a series of dams with a storage reservoir capacity of nearly 1,400,000 acre-feet, the utilization of upward of 2,000 feet of head, and the development of 454,000 primary horsepower or nearly 1,500,000 primary peak horsepower at 30 percent load factor."

I will ask you what that means in terms of an engineering method of operation?

A. Well the reference to 454,000 primary horsepower is clearly to the continuous power which could be obtained during the lowest flow seasons with the benefit of all available storage year after year. It represents the power which would be available if the regulated flow were utilized uniformly. By analogy, referring to the question the Court propounded, a few minutes ago, it would correspond with the power which would be developed from the Federal project at Bluestone if the 2,000 second-feet of regulated flow were used uniformly; however, coming back now to the sentence in point, at the foot of page 2, or top of page three, of House Document 91, it is evident from the remainder of the sentence it is not proposed to use the regulated flow uniformly. Rather it is proposed to develop 1,500,000 primary peak horsepower. The words "primary peak horsepower" mean that that equivalent uniform or continuous horsepower of 454,000 would be utilized on a peak carrying or variable basis, such that the maximum output would be not 454,000 but
2661 rather 1,500,000 horsepower. The ratio of 454,000 to
1,500,000 is approximately 30%, and that interpretation is borne out by the reference in the last few words of the sentence "30 percent load factor."

Q. Does the term "primary peak horsepower" mean that is the amount of horsepower that would be dependable available through part, or only part, of each day?

A. It represents the maximum peak power point which it would be proposed to yield.

Q. I direct your attention to paragraph 10 on page 3 of Government Exhibit #145, where it refers to plans on the main stem of the river, which says (reading): "* * * the regulated flow of the tributaries would afford at the Kanawha Falls plant and the three navigation dams a total of 51,000 primary horse-
2662 power or about 123,000 primary peak horsepower at 41 percent load factor."

I will ask you what that means in terms of engineering operation?

A. It has the same significance as in the sentence which you previously read, that is the minimum regulated flow, whatever it might be was assumed to be used uniformly if there were to be derived from it 51,000 primary horsepower, but if there were to be derived from it 123,000 primary peak horsepower it would necessarily not be used uniformly, and the result would be the peak load developed from that same water would be about 2½ times the average power output or load.

Q. According to the method of operation as indicated in Government Exhibit #145, how much variation might occur during the course of a single day in a discharge from the proposed Government power installation in the Bluestone dam?

A. Well, during the low-water season the variation might be from zero to about 10,000 cubic feet per second. During periods of higher flow the variation would be presumably from a flow somewhat in excess of zero up to a maximum of 11,000 cubic feet per second.

Q. Colonel Scheidenhelm, assuming a 4½ foot rise in the river above normal at Radford, please state what proportion of the time such a stage would obtain at Radford?

By Mr. Thompson. That is at the dam site?

By Mr. Jackson. No, at Radford, not quite the dam site.

By Mr. Thompson. You mean at the City of Radford?

By Mr. Jackson. Yes sir.

A. The question arises as to what is normal flow, and as to that I can show two figures within which I would think that normal flow would lie. If I assume that normal flow at Radford corresponds with a flow of 1,000 second-feet at the Radford dam site then 4½ foot stage above normal would be
2663 available about 1½% of the time on the average, or an average of about 5½ days per year.

If, on the other hand, I assume normal flow at Radford corresponds to 2000 second feet at the Radford dam site, then a 4½ foot stage above that normal stage would be available $1\frac{3}{10}\%$ of the time, or about 4½ days on the average, I believe, per year.

Examined by Mr. **Jackson**:

Q. Col. Scheidenhelm, is either the Byllesby or Buck dams and power stations operated under Federal license?

A. Neither of them is operated under Federal license or permit.

Q. When did the defendant, or its predecessor, commence the acquisition of land for the Radford dam site—how long ago?

A. About 20 to 25 years ago.

Q. During the course of the cross-examination of Mr. Gerdes, there was identified a sheet entitled "Maneuvers of dams on the Kanawha River during wave tests, 1930," marked "Defendant's Exhibit 543 for identification." It was our understanding that Mr. Gerdes retained that sheet marked for identification, and they think that we have it. We have a sheet which is agreed to be correct, subject to check, to be marked "Defendant's Exhibit 543."

(Exhibit 543 offered in evidence.)

2664 By Mr. **Jackson**:

Q. Col. Scheidenhelm, will you please state if wave No. 10, of the 1930 tests, was affected by any maneuvers on the dam?

A. Referring to Exhibit 228, and in particular to the course of the wave which is numbered rather lightly in that exhibit as No. 10, there were, on March 23, 1930, two maneuvers of dams on the Kanawha River which affected that wave in its passage at Dam No. 6 and Dam No. 7, respectively.

At Dam No. 6, on March 23, there were raised fourteen wickets between 8:30 and 9:30 A. M. At Dam No. 7 there were raised twenty wickets at about 10:30 A. M.

By Mr. **Jackson**:

Q. What was the effect of that maneuver on the amplitude, if any?

A. In each case the effect of the raising of the wickets was to raise the headwater at the respective dams, and, thereby, to increase the gage reading, and thereby to increase the plotted amplitude in stage for the given wave No. 10, and thereby also to increase the correspondingly deduced amplitude in cubic feet per second.

Q. Col. Scheidenhelm, is the slope of New River in the immediate vicinity of the Radford dam site comparatively steep or comparatively flat?

A. It is comparatively flat. At the Radford dam site there is one of the longest pools on the river. From the head of Ingles

Rapids, going in an upstream direction past the mouth of Little River, past the dam site, past Dunkard's Bottom and on to the foot of what was formerly called Moore's Gravel, the river is comparatively a single pool with a length of something over three miles. When there is a flow somewhat above average, the pool condition extends the greater part of a mile further upstream—that is, to the foot of the rapids at Falls Branch, on what is called the Howe place, and is shown on Defendant's Exhibit 545.

Q. What is the longest or flattest pool?

A. Around the Horse Shoe Bend and terminating somewhat down-stream from that point at the head of Sifford's Falls, there are two long pools which have a total length of about ten miles. The five mile stretch up-stream from Sifford's Falls is the flattest portion of the river—that is between the North Carolina line and its mouth. There is probably nothing further up-stream that is any flatter.

Mr. JACKSON. Your Honor will recall that counsel are trying to get certain information which, if it can be obtained, I may want to ask Col. Scheidenhelm to comment on briefly. I will confer with counsel about the status of that.

The COURT. You say that is all?

Mr. JACKSON. Yes, sir.

By the COURT:

Q. You touched on one subject I want to inquire about. You were asked whether the Buck and Byllesby projects had been constructed under Federal license.

Mr. JACKSON. Yes, sir.

By the COURT:

Q. I would like to ask whether they were constructed under authorization of the Secretary of War and Act of Congress?

By Mr. JACKSON:

Q. Are you familiar with that?

A. Yes, sir.

Q. What is that fact?

A. They were not authorized in any form by the Federal Government.

Q. There was no Act of Congress?

A. There was no Act of Congress under which these dams were built. There had been Acts of Congress at earlier times.

Q. Was there any permit from the Secretary of War?

A. There was not.

By the COURT:

Q. Is it a conceded fact that the Federal Government has never made any effort to have removed the Buck and Byllesby dams as affecting navigability of the Kanawha River?

A. The fact, as stated by the Office of the Chief of Engineers and subsidiary officers in the field is that it was brought to the attention of the Chief of Engineers that those dams had been constructed without any permit, and there was ensuing correspondence, the details of which I do not know, although they are contained in a Senate document, No. 15. I do not recall the number of the Congress or the session, and nothing further was done about it. The fact was definitely known to the Chief of Engineers.

By Mr. JACKSON:

Q. I think it will be conceded that no steps were taken to remove the dams?

A. Certainly within the records of the power company, there is nothing to the effect that any step was taken.

The COURT. Does the record show the fact that any application had been made for the removal of this dam as affecting the navigable capacity of the Kanawha River? I inquire from the standpoint whether the Federal Government has ever abandoned the question of navigability. What I had in mind was the question of the present good faith of the Government in asserting that these dams are obstructions to navigation.

There is one other question which I think ought to be made a matter of evidence before you finish, either by concession or by formal proof, and that is whether or not this proposed project, the subject of litigation, requires the use of land or other property of the United States Government.

Mr. JACKSON. I will ask about that.

By Mr. JACKSON:

Q. Col. Scheidenhelm, you testified yesterday about the lands that had been acquired for this project: Please state whether or not any part of the project will involve the use of any land or any other property of the United States?

A. No land of that character will be involved.

Q. Does the defendant own all lands that are to be used for the project?

A. The defendant owns all the lands which will be overflowed by the Radford dam.

Q. On which any of the dam will rest, or the power site will rest?

A. At the dam site it owns a substantial amount of additional land extending out from the dam, to provide for area for construction purposes, and likewise downstream from the dam in connection with the quarry which will be used in supplying the rock for the construction of the dam.

By the **Court**:

Q. Does the Federal Government own any other property which will be involved in this?

A. None within my knowledge, and I am absolutely sure it does not.

Q. Do you know, Col. Scheidenhelm, whether the conveyances of land along New River in the vicinity of this project (any ordinary conveyance from one citizen to another) run from center of the stream or to the edge?

A. They run variously.

By the **Court**:

Q. It may be variable in that matter?

A. Yes. Some refer to the river as the boundary, and others more specifically.

By Mr. **Jackson**:

Q. You have seen the conveyances, have you not?

A. I cannot say I have seen all of them, but I have seen a multitude of them.

CROSS EXAMINATION

By Mr. **Thompson**:

Q. Colonel, you served during the war, did you not, with the United States Army?

A. I did.

Q. You are not in the United States Army now, are you?

A. Not except in the sense that I am a commissioned officer of the United States Army Reserves.

Q. And do I give offense when I address you as "Colonel" or not?

A. I hope you would not give me offense, no matter how you addressed me.

Q I was reading the record over, and I apparently gave counsel offense yesterday, and I was trying to figure out how or why I gave offense, and I do not know how.

A. I have heard you pronounce my name differently from what it is pronounced.

Q. It was not any question of detail. It was my pronunciation.

A. I cannot speak for counsel.

Q. I believe you said that you became connected with the defendant company in about the latter part of 1925?

A. I do not believe I stated the latter part of 1925.

Q. Well, about what part of 1925?

A. I haven't looked it up, but my impression is that it was the early part of 1925.

Q. And when you did become a representative of the company, it was necessary, or you did visit the offices of the Federal Government in Washington quite frequently, did you not?

Mr. JACKSON. I object to the question as it assumes that he became a representative. I do not know what he means by that. If he means that he became engineer, it is satisfactory.

The COURT. He stated his connection with it—I think as Consulting Engineer.

A. As regards this particular project, I did not, immediately upon being retained by American Gas & Electric Company, by itself and subsidiaries, come into contact with the Radford project. I do not recall at the moment just when was the first time that I did get into touch with this project, but it was not for months afterwards, nor, I believe was it within 1925.

By Mr. THOMPSON:

Q. Were you retained by the American Gas & Electric Company or by the Appalachian Electric Power Company, or by the Appalachian Power Company?

A. Originally by the American Gas & Electric Company.

Q. And do you represent the American Gas & Electric Company now?

A. I served it as Consulting Engineer.

Q. And you are on a retainer with it, are you not?

A. No.

Q. You do special work and are paid by it; is that it?

A. Yes.

Q. And are you regularly retained by the Appalachian Electric Power Company?

A. Not in the sense of a retainer, as we know it in the engineering profession.

Q. Are you a stockholder in the Appalachian Electric Power Company?

A. I am not.

Q. Are you a stockholder in the American Gas & Electric Company?

A. No.

Q. Or any of the affiliates of either company?

A. No.

Q. Now, you did have frequent dealing, did you not, with the Federal Water Power Commission?

A. I had frequent dealing with the Federal Power Commission.

Q. You were always received courteously there, were you not?

A. If there was any discourtesy, I do not recall the particular time.

Q. The Commission let you go through its files, did it not, from time to time?

A. Not in that sense, no.

Q. Didn't it submit its files to you so you could go through them and look them over?

A. With regard to the Radford project——

Q. (Interposing.) Of course, I mean the Radford project?

A. (Continuing.) There was placed before me at one time a file of correspondence and other matters with regard to the project, but, at that time, there was definitely withheld another file, the precise detail of which I do not know, and that I have never seen.

Q. Did that have to do with the Radford project—the one which you say was withheld?

A. Yes.

Q. You know, don't you, Mr. Fraser Horn, of counsel for the defendant, has gone over the files and has had copies made of the papers in the Radford project matter?

A. So far as I know, and I believe I know the complete fact, he saw the same files that I did, and was refused access to the same file to which I was refused access.

Q. Can you give any idea of any files you have been refused access to?

A. My recollection is that it was a technical file which may have had a name dealing with the word "Fluctuation."

Q. Was it the wave study file?

A. I did not see the file.

Q. Then you have also, during this time, had access, have you not, to the files in the office of the District Engineer at Huntington?

A. No.

Q. You have been there many times, have you not?

A. Yes.

Q. You have always been received with extreme courtesy, have you not?

A. Certainly with courtesy.

Q. And they have let you copy and photostat documents in there, have they not?

A. Certain of them.

Q. Have they ever refused you any information which you have asked for?

A. Yes.

Q. What?

A. I do not recall specifically.

Q. Is that the one that was brought up here by Mr. Jackson in his statement to the Court?

A. Oh, no. Time and again at the Federal Power Commission, at the office of the Chief of Engineers, and at the office of the Division Engineer, and at the office of the District Engineer, the statement would be made, and quite properly so, that the matter was such that they could not show it to me.

Q. All the matters that were proper to show, they did show you, didn't they?

A. That would be for them to say. I don't know.

Q. Has there been any refusal, you know of, of a right that you had as a citizen?

Mr. **Jackson**. I object to that question.

Mr. **Thompson**. I am practically repeating your words in your statement you made before the Court.

The **Court**. Let him answer.

Mr. **Jackson**. Exception.

A. I presume you mean a right which I had to correspondence or documents in any of the offices?

By Mr. **Thompson**:

Q. Yes.

A. Yes, I think so.

Q. Can you give us one or two examples? I am referring now particularly to the Radford matter.

A. Well, I just have impressions, not having searched my memory or my own records, or otherwise, for an answer to a question like that, but I have the impression that, as time grew on, there was a reticence to show various documents. I had the impression that the records involving various fluctuation matters, for instance, should have been shown.

Q. But you cannot give any definite times or any persons who have refused you your right as a citizen to the files of the Federal Government in respect to the Radford project?

Mr. **Jackson**. I object to the question, as I do not know that the witness is competent to define what his rights would be.

The **Court**. I do not think the question is properly phrased. Ask how he was treated.

By Mr. **Thompson**:

Q. Well, how were you treated by the War Department (that is the Engineers Office), and how were you treated by the Federal Power Commission, with respect to the Radford project?

A. Well, I think in general very well, but on the specific point on which you are touching as to placing me in touch or exhibiting documents which I believe were pertinent to the matter, there were various occasions, both at the office of the Chief of Engineers and at the Power Commission, when there was a refusal to exhibit documents.

I have in mind one instance at both places. It began at the Federal Power Commission. At the time there were placed before me, and for more detailed perusal, by Mr. Fraser Horn, certain files, it was definitely understood that upon the occasion of my next trip to Washington I would have access to the files on the subject involving fluctuation. I do not know by what title that file was known.

The only reason for not going into it at that time, so far as either I was concerned or the then Chairman of the Commission, Mr. George Otis Smith was concerned, was that I did not have the time to do it, but, by the time I came to Washington next, the situation apparently had been changed.

There had been engaged special counsel for the Government in the matter, and the access to the file was refused.

As regards the office of the Chief of Engineers, there had, in general, been made available documents and reports, and I recall that within the past year I desired to see a report of a District or Division Engineer which dealt with New River in the case of a report upon the Bluestone project, and that report I was permitted to see. And, again, I did not have time to completely look over it, but, again coming, I was told that orders had been issued not to show that document.

Q. Well, you do not claim that you were refused the right to see documents which you, as a citizen, had a right to see, do you?

A. I would say that is a legal question.

Mr. **Jackson**. We object to the question, as to what the witness' rights are.

The **Court**. I sustain the objection.

Mr. **Thompson**. Exception.

By Mr. **Thompson**:

Q. You are an officer of the Franklin Real Estate Company, are you not?

A. I am not.

Q. You have been, have you not?

A. Never.

Q. Have you been a director?

A. Never.

X Q. You have spoken of being Consulting Engineer of the Defendant Company. Have you ever been the Supervising Engineer of the Company?

A. Not of the Company, no.

X Q. Or of any of the projects of the Company?

A. I have been Supervising Engineer temporarily with regard to the construction, and preparation for construction, on specific projects.

X Q. Have you ever constructed a power project?

A. Well I have acted as Chief Engineer of the companies actually constructing them.

X Q. But have you [interrupted].

By Mr. **Jackson**. Had you finished your answer?

A. I don't know how one could get closer to the construction of a project than to act as Chief Engineer of a company in the design and the construction of the project. One cannot lay bricks and mix concrete and do all of that in building a large power project, although I have done each of those things in connection with smaller work in my earlier days.

Q. Have you ever constructed as Construction Engineer a power project?

A. Not from beginning to end.

Q. Have you ever operated a power project, speaking now as an Operating Engineer?

A. Not as a regularly engaged shift operating Engineer.

Q. When the London and Marmet power plants were constructed Mr. Slocum was the Defendant's Engineer, wasn't he, or the Engineer for the construction of those power plants?

A. He was Resident Engineer.

Q. Didn't he testify [interrupted].

A. May I finish?

By Mr. **Thompson**. Yes, I thought you had finished.

A. He was the Resident Engineer, with the title Construction Engineer in charge, but that title meant in all respects the local responsibilities of the work.

Q. And I believe you said there was a couple of months there when you actually went down on the project, or is that correct?

A. No, I didn't state I spent several months on the project.

Q. You were Supervising Engineer then?

A. That is true, that is, I actually performed the duties as pinch-hitter so to speak for the Chief Engineer of Kanawha Valley Power Company, who had met with an accident, and it was a rather critical period in starting the construction of the London and Marmet developments. There were all the details to be cleared up with local land owners and getting contracts formulated and let, certain force account work and everything necessary toward getting the projects under way in order they might be completed within the rather exceptionally short time they were completed. I did the same kind of work which the Chief Engineer would otherwise have had to do.

Q. A Consulting Engineer may come in on a project after someone else has set up the plans and give his judgment; isn't that his function?

A. That may be his function in a specific case, but that is not by any means a statement of the field of the Consulting Engineer, nor of the field which I have occupied with regard to these projects.

Q. I just asked you the general question; you are giving us a grand talk each time I ask you a question. I asked the general question as to the functions of a Consulting Engineer in a general respect.

A. Will you read the question if I have not answered it properly?

Q. You have answered only away beyond the question. Now does a Consulting Engineer declare policies on a project?

A. In general he might declare them to his heart's content, for himself, but that does not mean the policies would be accepted by those who have responsibilities of ownership.

Q. Did you ever declare policies for the project on New River, taking for example first of all the London and Marmet dams?

By Mr. Jackson. What is meant by declaring policies? I think that should be somewhat more explicit before it can be answered.

By Mr. Thompson. Policies of operation—policies of accomplishment.

A. I have time and again formulated what I believed to be appropriate policies for the owner of a project to adopt, and have recommended those policies, and in most cases I would suppose they had been accepted, but not in all cases have they been accepted.

Q. Have you ever been authorized by the Appalachian Electric Power Company or the Kanawha Valley Power Company to express its policies?

A. Undoubtedly, on occasions.

Q. And those occasions you became more than a Consulting Engineer, didn't you?

By Mr. JACKSON. I object to that question as argumentative, whether or not he did is a conclusion for the Court to draw, if material.

By the COURT. He may answer.

A. On various occasions and for specific purposes I was authorized to make statements of policy, statements which would bind the company.

Q. When you were before the West Virginia Public Service Commission you and Dr. Mead, you were speaking, were you not, for the company?

By Mr. JACKSON. I object to that. It appears he was a witness at that hearing.

By the COURT. He may answer. He asked if he did not appear for the company.

A. I cannot say I appeared before the Commission as representing the company. I appeared as an Engineer.

Q. You did state the policies of the company before that Commission, at the hearing had in 1930?

A. I may have. I don't recall.

Q. I hand you what has been identified previously as Government Exhibit #222 for identification, being a letter on your letterhead, addressed to Major H. M. Trippe, dated February 8, 1927, signed by you. I believe that is your signature.

A. That is my signature.

Q. I read to you the last paragraph of this letter: "So far as concerns water requirements from upstream—particularly from New River No. 6 or Radford development—the subject was discussed at the office of the Chief of Engineers while I was at Washington early last week in company with Mr. Bevan of Viele, Blackwell & Buck. We have had the privilege 2665 of seeing your report on the application for license. Study is now being made of a clause to be suggested for the purpose of covering the protection of navigation and at the same time allowing as far as practicable the operation of the proposed hydro plant on a peak-carrying basis—for that is the only basis on which that development is economically justifiable." That is your letter, is it not?

A. Yes, sir.

(Exhibit 254, being Letter dated Nov. 14, 1927, to Major E. D. Ardery on "New River Development #6 (Radford), Geological Examination," from F. W. Scheidenhelm was offered in evidence.)

(Exhibit 255, being Letter dated Nov. 17, 1927, to Major E. D. Ardery on "New River Development No. 6 (Radford), Geological Examination," from F. W. Scheidenhelm was offered in evidence.)

(Exhibit 256, being letter dated Oct. 16, 1931, to Major Fred W. Herman, pertaining to maintaining pool levels at dams 2, 3 and 4 on Kanawha River from F. W. Scheidenhelm was offered in evidence.)

(Exhibit 257, being Letter dated Sept. 18, 1934, to Major John F. Conklin on "Hydro electric Project of Appalachian Electric Power Company on New River near Radford, Virginia," from F. W. Scheidenhelm was offered in evidence.)

(Exhibit 258, being Letter dated Apr. 2, 1936, to Major John F. Conklin on "Radford Hydro Project of Appalachian Electric Power Company, Capacity Curve of Reservoir," from F. W. Scheidenhelm was offered in evidence.)

(Exhibit 259, being Letter dated Apr. 12, 1932, to Major Fred W. Herman, on "New River Power Wave Study," from F. W. Scheidenhelm was offered in evidence.)

(Exhibit 260, being Letter dated Apr. 20, 1932, to United States Engineer Department, signed by Daniel W. Mead and F. W. Scheidenhelm in type, under that "By R. H. Stearns" was offered in evidence.)

(Exhibit 261, being Telegram dated Dec. 10, 1930, to F. E. Bonner, Executive Secy., Federal Power Commission, from F. W. Scheidenhelm was offered in evidence.)

Q. When the Appalachian Electric Power Company filed its application, I think in 1926, originally, with the West Virginia Power Company—I mean in 1924, with the Public Service Commission, you had—I believe you testified yesterday the intention then of having just one dam, did you not?

A. I had nothing to do with any application filed in 1924, and I had no intention at any time in regard to a single dam, but it is my understanding that the predecessor of the Appalachian Electric Power Company, or more likely, the West Virginia Power Company, itself—because I believe it was in existence then, had such a plan.

Q. Isn't it a fact that the reason for the change in this from one dam to two dams was caused by the objection of the Electric Metallurgical Company, or the owner, the Union Carbide Company, on the ground that, if you had just one dam there, the waves would be destructive of navigation down below and would be destructive of the interests of the Electro Metallurgical Company at Glen Ferris Dam?

A. I think in reply that I should separate that into two parts: The reason for the change and the other reason for the opposition on the part of the Electro Metallurgical Company:

As regards the change, it is true that, so far as my recollection of the matter is concerned, it initiated—it was due largely
2666 to the fact that the Electro Metallurgical Company had riparian rights downstream, part of which it was utilizing and part it proposed to utilize, and this utilization of the water power was on the basis and presumably it would be continued on the basis of a relatively uniform use throughout twenty four hours of the day, seven days a week and so on, and that the use to be made of the power development by the West Virginia Power Company in the Bluestone region would ordinarily involve some form of peak carrying operations, with some form of variable flow, and those two things were not compatible.

If sufficient distance intervened between the development having a variable discharge and the power development showing, relatively, a uniform discharge, then question might arise. It did arise in the case of the Bluestone project, because there was a very short distance—only a few miles—from Hinton Dam site to Sandstone Falls not far below Hinton, and, moreover, that section of the river has a very steep slope, so there would be relatively less dampening out of any fluctuations.

As regards the other phase of the question that you ask, I have no doubt that the Electro Metallurgical Company expressed concern—some solicitude for navigation of the Kanawha River, but I suspect its primary cause was in regard to its own riparian rights and use of those.

Q. It did own the site at Sandstone Falls—Hawley first owned it and then it was sold to the Electro Metallurgical Company, wasn't it?

A. It is my impression that Sandstone Falls was by that time owned by the Electro Metallurgical Company or its affiliates and others were by the Electro Metallurgical Company, as there are now downstream from the Sandstone Falls, including Hawks' Nest and Kanawha Falls, existing developments.

Q. You were present at a hearing before Major Trippe on September 28th, 1926, at Radford, on the hearing of the
2667 application of the Appalachian Electric Power Company for a license to construct a water power project?

A. I stated that I was there as an observer.

Q. At that time, didn't the Electro Metallurgical Company make a protest?

A. In that connection—whether or not it was at that time or later on, I don't know, but it was in that connection.

Q. They announced that they would protest and later sent in a letter, didn't they?

A. I would not be surprised if that were true.

Q. That is in evidence as Government's Exhibit No. 101. Prior to that time, this company that you represent in no way ever indicated to anybody that they expected to change from a single dam to the two dams. Isn't that a fact?

By Mr. Thompson:

Q. Do you know?

A. The fact probably is that the idea of a two stage development did not originate with anybody until it originated in my mind, and in 1926, I don't believe I had studied the situation.

Q. So that your thought about the change came subsequently to 1926?

A. It did, within the limits of my recollection.

Q. Very briefly, you have testified that there is a site for a reservoir at Sandstone Falls. Is that a correct statement?

A. I would not call it a reservoir.

Q. A power site?

A. Yes, sir, there is a power site there.

Q. And the place is designated or has been designated from time to time as the gorge between Hinton and Kanawha Falls. There are, are there not, dam sites or power sites down through that gorge?

A. Well, it is a continuous succession of dam sites, but for economical development in that region, one is concerned more with the question of tunneling divers distances than with dam sites. 2668

Q. You could construct dams there, though, to a height of forty feet and get a height sufficient to create power along there, could you?

A. Yes, it would be physically possible to construct them, but I don't believe they can be constructed to that height without a substantial change or cost for a change in the Chesapeake and Ohio Railroad tracks.

Q. Isn't its road-bed higher than 40 feet—something over 50 feet up from the bed of the river?

A. I don't know what the precise distances are. I am certain it is not 50 feet everywhere; that it is less than 50 feet in many portions, and I am doubtful if a 40 foot height could be constructed in a sufficient number of places to allow that figure to be used as a generalization with respect to the situation.

Q. The Electro Metallurgical Company, when it constructed the Hawks' Nest project had gates to more than 50 feet in height. Is that correct?

A. I think that is approximately correct, but one would naturally choose, and undoubtedly the Electro Metallurgical Company chose, a place where that could be done, and it is simply my point that that is not universally true. I think that is the exception.

Q. They actually moved the railroad tracks there, didn't they?

A. Not within my knowledge.

By Mr. Thompson:

Q. Colonel, I call your attention to defendant's Exhibit 594, and in your testimony of yesterday at page 6237, at the top of the page, in which you say: "I consider a reasonable form of discharge is that depected on the chart forming Exhibit 594." I believe you testified, did you not, one of the reasons you stepped this wave up gradually?

A. No, I don't think I testified to that effect.

Q. Would you say that that was one of the reasons why it was a reasonable form of wave?

2669 A. No, I don't think so. It would have steps in it. Any reasonable form would have steps.

Q. It would be a much more reasonable form of wave than if the wave was perpendicular—the left-hand side, we will say?

A. Yes, that is true.

Q. It is a fact a wave that is perpendicular seldom exists, is it not?

A. I take it by "wave," the discharge from the power station which would result from an instantaneous opening up of the complete power situation. That is very rare.

Q. On page 6240, you stated as follows:

"Q. Have you given any consideration to the rectangular or block form of discharge from the power station? Mr. Thomas testified that he considered that in connection with his study of the power tides from the Radford station?

"A. I have. I gave consideration to that form, prior to the work of Professor Thomas and was responsible for his studies and tests with that possible form of operation, but I looked at it as embodying the literal meaning of possibility without any possibility of being probable, let alone certainty; I considered it to be a theoretical form—a theoretical plaything rather than anything in my opinion that would be reasonable to conceive as a natural occurrence."

That is your testimony yesterday, is it not?

A. Well, I think it is except for a few garbled words.

Q. Now, turn to Government Exhibit 227. That wave No. 1, isn't that practically perpendicular?

A. It is very close to it.

Q. Do you think that is a fair test of the type of wave to be used in testing as to waves going down this river?

2670 A. A fair test in what respect?

Q. A fair test of the fact that you say such a wave as the rectangular wave (that is with a perpendicular side to it) is only in the realm of the theoretical and not practical?

A. No. I said, I believe, and still say, that any instantaneous, or almost instantaneous, bringing on of the complete capacity of a power station containing a number of units, is not beyond a possibility, that would occur in cases of emergency. Also the cutting off of the discharge of a power station practically instantaneously, by reason of the interruption in connection with the transmission circuit, but I do not conceive that it is a reasonable expectation with regard to a station like the Radford station, that it would open up the complete capacity instantaneously and continue operating at that capacity for eight hours, and then cut off instantaneously.

Q. Yes, but were not you giving a test here in 1930 by which you were going to judge the Radford project and its discharge and the effect of that discharge upon the river?

A. I do not believe it is proper to say "by which I was going to judge the Radford project or its discharge," but the aim was to propogate various forms of power tides or waves, so that from them there might be gained as much light as possible with regard to the future prospective performance of power tides or various forms which might be propogated by the Radford station.

Q. You were in charge of this demonstration which they used up at the Buck and Byllesby, were you not?

A. Yes.

Q. You were practically the man at the throttle, weren't you? If they don't use a throttle, what do they use when they open up for waves?

2671 A. It is hardly a throttle, but the metaphor may do.

Q. You were the man who was there and conducting how the waves or discharges were going, were you not?

A. The waves were released under my direction.

Q. And when you released those waves, wave No. 1——

A. (Interposing.) I didn't release them.

Q. You had somebody else release them?

A. Yes.

Q. And under your charge and direction?

A. Yes.

Q. Wave No. 1 is practically perpendicular, isn't it?

A. Well, at the Ivanhoe Gaging Station it was practically so, and undoubtedly it was at least as much of that form at Buck.

Q. And wave No. 2 was the same way, wasn't it?

A. Yes.

Q. And wave No. 3 was the same way?

A. Yes.

Q. And wave No. 4 the same way?

A. Very closely.

Q. Wave No. 5 also the same way?

A. Not so much.

Q. It is almost imperceptible, the change, isn't it?

A. It depends on who was looking.

Q. You are a good looker; what do you say about it?

A. I say it is not.

Q. Wave No. 6, isn't it?

A. Very closely.

Q. And the left side of wave No. 7 is, isn't it?

A. Yes.

Q. So that these waves had at least one side, the side of a 2672 rectangle, as they came from the discharge; is that right?

A. They had practically a vertical front as they left the Buck site, and as they passed the Ivanhoe Gaging Station site.

Q. In view of what you testified to yesterday, was that a fair basis on which to make a test for that type of wave?

A. If anything, my impression is that it would, with the amount of water available, result in lower amplitude downstream if one were to depart from that.

Q. Read my question.

NOTE.—The question was read.

A. Well, I think it would probably have been somewhat more illuminating if, at that time, one had known precisely what kind of operation there would be at the Radford power station and released a wave which, in its performance in passing the Radford site, would have had precisely that future form and met precisely the stream bed conditions as regards base flow, and otherwise, which would be met under future operations. Under those circumstances, one would have had the equivalent of the action of real Radford power tides, released from the power station, but there was no such opportunity. One could not know then any more than now what the process is.

Q. But I am asking now, in view of all your foresight and hindright in these matters, are these forms of waves a fair test, when you are going to relate it to the conditions at the Radford project?

A. I do not think there is a one of the lot that represents a specific form such as would ever be released from the Radford power station, or even is that true in passing the Radford dam site, but it is more nearly true of their forms in passing the Radford dam site.

Q. Being an expert in this wave matter, and having given us this design in this defendant's Exhibit No. 594, why couldn't you have stepped those waves up a little, as was done in 594?

2673 A. Leaving aside the matter of being an expert in wave matters——

By Mr. **Thompson**:

Q. (Interposing.) I thought you were.

A. (Continuing.) I will say it would have been possible to have stepped those waves somewhat, and to have used somewhat different forms than were used.

Q. Then why didn't you do it?

A. I don't recall the reason. I think, for one reason, that we didn't know as much about it as we do know, and we do not know everything about it now. We know a lot more about it than we did then.

Q. What was the volume of wave No. 1 as it came out from the discharge, and as shown on the map, above Ivanhoe?

A. I do not know off-hand, but I can give you an estimate made by an assistant.

Q. You testified yesterday that the discharge reached a maximum of a little short of 14,000 second-feet, and somewhat in excess of 15,000 second-feet at the Buck; where was the discharge of these waves that you were showing us of 14,000 and 15,000 second-feet?

A. My reference, as I recall it, to a discharge a little less than 14,000 was an estimate at Ivanhoe Gaging Station, and the reference about 15,000 was a pure judgment estimate on my part to the effect that if a given wave had an amplitude in second-feet of a little under 14,000 second-feet at Ivanhoe, it would have an amplitude definitely greater as it left the Buck site.

Q. That was a guess then, was it not?

A. Purely so, and I think I stated that in effect.

Q. How long did this discharge of 15,000 or 14,000 second-feet last?

A. As I stated, it was very brief. It was peak discharge—I mean peaked in form.

2674 Q. So you would not have the Court to believe that at any time these waves were made on 15,000 or 14,000 second-feet discharge, would you?

A. I thought I was rather careful to state with regard to the waves of maximum amplitude, namely, waves 15 and 16, that I did not consider that they were typical of anything.

Q. And you have no wave here made from a continuous discharge of 14,000 second-feet or 15,000 second-feet?

A. If by that you mean over any prolonged period, such as 6 or 7 hours, or even a few hours, the answer is no.

Q. As a matter of fact, you could not discharge over that time there, an hour or an hour and a half, at the rate of 15,000 second-feet, could you? It is less than that, isn't it?

A. No, you could not. That was the limitation of the amount of water available there. That is the head began to drop, and, therefore, the discharge automatically decreased.

Q. Was one of the reasons why you did not make the waves of greater duration, or of greater volume, because there was not sufficient water in the reservoir?

A. Yes. That is the sole reason that we did not get greater prolongation of them. As a matter of fact, after this series of tests was completed, we endeavored to find a time when conditions on the river would be better adapted for getting waves of still greater volume, greater amplitude and longer duration at the time of propogation. I think I was after a period when the in-flow into Byllesby was something like 3,000 second-feet, hoping to get about that condition, but the condition did not occur within a number of months, perhaps a year, after these tests were completed, and then other matters interfered, and I was unable to bring about the making of these further points.

2675 Q. So your trouble there was you did not have capacity in your reservoir to have waves of any other length, or capacity, or duration, or volume?

A. That was the obstacle to having waves of greater amplitude and correspondingly greater duration. We had pretty fair volume in some of these waves, however. There were certain waves which had volumes which were in general order, although not equal to that of the discharge, as per Exhibit 594. There was one wave, and perhaps more than one, that had a volume approximately equal to the daytime load, as indicated on Exhibit 594.

By Mr. THOMPSON:

Q. Which wave was that?

A. In the case of No. 11, the volume of that wave itself was about 2900 second feet days, which is a little greater than the principal element of discharge for Exhibit 594. In the case of wave 10, it was a little lower.

Q. A little lower?

A. Yes.

Q. And wave 10 is practically perpendicular, isn't it?

A. Wave 10 was almost so at the point of initiation.

Q. Now, isn't it a fact that there are two causes of flattening by waves, and both of them are gravity? In other words, if you have a fountain piling water up in the air, it comes down, and that is pulling down of the earth; and isn't the second factor that there is a flattening out because of the downstream pull on the water?

A. I certainly can agree as to the law of gravity effect, but as to the other I confess I do not understand.

Q. I ask you if this kind of wave you named such as 2676 1, 2, 3, and 4, with the perpendicular line indicating that the discharge was immediately at its extreme, wouldn't those waves naturally, with a short trough between them, wouldn't the tendency there be for those, to use a layman's word, to melt down going downstream? In other words, to level off?

A. Are you referring to 1 to 3?

Q. Yes.

A. I do not think that is true with respect to those more than others.

Q. Wouldn't that be true with respect to those as with respect to defendant's Exhibit 594, where you have such a large base?

A. Given a sufficient distance for travel, I doubt whether the precise form of propogation has a great deal to do with it. If one looks at that same exhibit 227, the forms of the waves, after they have once accommodated themselves to the stream bed and the steepness of slope of New River, do not differ greatly. I have been, myself, unable to determine, from looking at the form of a wave as it passed Hinton, or even the Radford site, to tell what kind of form it had at the point of propogation. They have, roughly, the same general forms after they get started down the river.

Q. Now, turn to Government Exhibit 226; on page 5848, Professor Thomas said:

"Q. Would you say the mode of operation of #226, as indicated by that chart, was as reasonable as the mode of operation on defendant's Exhibit 594?

"A. I can't say one is more reasonable than the other. In my opinion they are both of the same general type."

Now, looking at Exhibit 226, I note there that there is an allowance made for Saturday and Sunday; in other words, 2677 the discharge dropped very decidedly on Saturday and Sunday.

A. What do you mean by "allowance made?"

Q. I corrected it by saying a discharge. Now, why didn't you, in making these tests, make some such allowance as that at the Duck and Byllesby dams in 1930?

Mr. **Jackson**. An allowance of what—of shutting down?

Mr. **Thompson**. A stopping off of the peaking during Saturday and Sunday?

A. Well, there are several reasons, I suppose. I don't know whether it would have been done if physical conditions had permitted it, but actually the limitations of pondage at Byllesby made it imperative to let go, so to speak, once the pond filled up and the water over topped the gates.

Q. Then you would not have a wave on any test here in 1930 comparable to the situation such as you would have had at Radford on Saturday and Sunday, would you?

A. No. That element was recognized and covered by the studies and experiments of Professor Thomas.

Q. Now, isn't it a fact that the trough of the wave between Friday and Monday is much longer than the trough between the waves of Monday, Tuesday, and Wednesday?

A. It is longer than the troughs between waves propogated successively on Monday, Tuesday, and Wednesday.

Q. And isn't the problem down below, after all, a wave which has a very long trough or a very long crest, rather, as compared with little short waves, as you have shown here on Exhibit No. 227?

A. I am not certain that it is, no.

Q. You would not say that it was not, would you?

A. I would not say that the results obtained by Professor Thomas did not take those factors into account.

Q. I am asking you about yourself—your views, and not his views.

2678 A. Repeat the question.

A. I should continue by stating that the reason for my statement is that I am not at all certain that that is the problem; and I assume you mean the major problem, the difficult problem. My reason for the view that it is not such as the result Professor Thomas obtained. He specifically considered that aspect. That is not covered in this series of 1930. That is, there was no gap between propogation of waves such as would correspond to a week-end shut-down of Sunday or Saturday night. There is nothing so long as 24 hours. It was impossible for the reservoir would not hold the water.

Q. What I am saying is, that that 1930 test was not a fair representation of the type of wave which you will discharge out of your Radford project if you operate it in a form such as is shown on Exhibit 226, or as your wave on 594?

A. When you use the word "fair" or "unfair" in connection with the 1930 series of tests, it carries an implication that any given form of wave propogated at Buck and Byllesby was intended to represent a given form of operation at Radford. Now, such is not the case. It was rather intended to cover a variety of forms of power tides under the best conditions that were available then. I have no doubt that the tests could have been conducted with greater intelligence if the available facilities could have been used, but with our limitation of mind and the physical conditions, we did the best we could. The object was to develop information on the basis of which further studies could be made, and Professor Thomas took it up from that point and made studies which, among other things, involved the integrating model——

WITNESS. I have not attempted to say what Professor Thomas said. He, of course, can and ought to speak for himself, but you were asking my view, as I understand it, as to what conclusion I would draw, and I must say that my own conclusions, as 2679 of the present time, are affected not merely by the results of the 1930 wave tests but by the studies and tests which were made by Professor Thomas under my general direction.

Mr. THOMPSON:

Q. So that, if I gather correctly from you, these waves were discharged down there with what knowledge was had at that time, but now would be regarded as almost going in the dark, so far as the waves are concerned?

A. I don't think you understood correctly what I said, no.

Q. Well you have not given waves here that are in any way comparable to the system of waves you would be discharging at the Radford project, have you?

A. I would say they can be compared, that some deductions can be made from them, that they cannot be used within precise limits but certainly the behavior of power tides traveling over a distance of two or three hundred miles on New and Kanawha Rivers is indicated in various respects and to a good purpose for drawing further conclusions, particularly when one works with models, which with a sufficient degree of accuracy can duplicate these results of 1930, then it may be reasonably assumed those same models will reasonably duplicate results from other forms of power tides generated at the same point, traveling by the same gaging stations.

Q. You did not work with any models?

A. Personally I did not.

Q. So that is hearsay from what Professor Thomas said?

A. Not completely. When he said he had certain results I accepted his statements that such and such results followed.

Q. That is hearsay, isn't it?

A. As far as results of computations and experiments and so on are concerned it is hearsay of the same kind I have in

2680 my office if an assistant says to me "I did so and so with such results."

Q. Were you present when Professor made any tests?

A. I saw the models work.

Q. You saw the tests made?

A. Not all of them.

Q. How many did you see?

A. Very few.

Q. When did you seem them made?

A. During the course of this suit.

Q. Did you see the test of a wave like wave #4 for example?

A. No.

Q. What waves on here did you see run through his model?

A. None.

Q. Now let us go to wave #4 on Government Exhibit #227, and let me ask you if the gradient from Ivanhoe to Radford isn't very much steeper than from Radford down to Hinton?

A. Well except for the section between the Norfolk & Western crossing at Pepper Tunnel and the flat section of the river around the Horse Shoe Bend I don't think it is substantially different.

Q. When you considered the question of these waves going down the river, for instance wave #4, did you take into consideration the fact that Radford is approximately fifty miles nearer than the place from which the wave was discharged, that is fifty miles nearer to Kanawha Falls or lock #2?

A. Yes, that is an obvious fact.

Q. Wouldn't a wave that started from Radford, a 9,000 second-foot wave, beginning say on Monday morning, and lasting for eleven hours, discharging for eleven hours, wouldn't that be much more liable to keep its form than a wave that would start from Ivanhoe?

A. What kind of wave from Ivanhoe?

2681 Q. The same, say 9,000 second-feet—I am considering a wave of the same volume, wave of 9,000 second-feet?

A. And the same form?

Q. Yes.

A. Except for that relatively short flat section around the Horse Shoe Bend I wouldn't think there would be a great deal of difference. Possibly out of the Buck station or Ivanhoe, as you refer to it, there might be a little more assumption of what I think is the general form set forth on Exhibit #227. Of course if you mean that is measured at a given point downstream I would say that it follows as a matter of course that a wave of given volume and form, released at Radford, would persist somewhat further downstream, would adhere more nearly to its original form as measured at some downstream station than a wave of the same volume and same form released at Ivanhoe, providing all other conditions are the same, including water in the stream bed, that is the relative emptiness of the stream bed.

Q. Now this wave #4, was there any interference with it, with respect to the raising and lowering of wickets?

A. As far as measured in the Kanawha River I believe there was not. I shall check that. There was a wicket operation I believe just before the preceding wave came to its succeeding trough, and that was in the case of lock #6, I believe, but it is very questionable whether that influenced the form of volume or amplitude of wave #4 at lock #6. It might have, but I think it is questionable. I should say the probability is it did not.

Q. Following wave #4 down the river, what do you find its volume to be at Radford?

A. At the Radford dam site about 1,620 second-foot days.

Q. What is that in acre feet?

2682 A. About 3,200 acre-feet.

Q. And what is it in acre feet when it gets down to lock #2?

A. About 2,800 acre-feet.

Q. So it retains 60% of its volume, does it not, when it gets down there?

A. Well I don't believe it actually did. Various information indicates quite definitely that is not true.

Q. Didn't Professor Thomas agree it was approximately 2800 acre feet?

A. He was giving the same sort of information which I have indicated here when I said—what was it—1,620, perhaps I should not have stated that that was the amount. I have even during the pendency of this suit checked up on that Allisonia gaging station, which is in operation, and the rating curve, which is subject to check from time to time, and have been informed by the office of the District Engineer of the Water Resources Branch of the Geological Survey for Virginia that the rating for Allisonia is somewhat in error, and that carries an implication very strongly to me that the difference between the Allisonia and the dam site "A" rating curve, which was only a temporary one, and based on very few measurements, is in error. The whole thing looks fishy to me, so to speak, with regard to that wave #4 and others at the dam site. For instance, if I read down the column of computations made in my office for Wave #4 I have these figures for volume:

At Ivanhoe 2160 second foot days.
At Allisonia 2060 second foot days.
At Dam Site "A" 1620 second foot days.
At Eggleston 1770 second foot days.
At Glen Lyn 1740 second foot days.
2683 At Hinton 1,720 second-foot days.
At Caperton 1,200 second-foot days.
At Kanawha Falls 1460 second-foot days.

Now those variations say to me one cannot rely on them. I wish we had more accurate data. I wish we knew more about it than we do, but the indication is very strong and outstanding to me that the dam site "A" rating, the one ordinarily referred to here as the Radford rating, is wrong, and the Allisonia is somewhat wrong, which makes the dam site "A" rating appear all the more in error.

Q. Well if as you say this thing looks kind of fishy to you, what is the worth of all these waves then; aren't they useless; aren't they based on a lot of useless data?

A. No, one element of all these tests that is very clear cut and is not in error except as regards possible slips now and then by gage readers, as for instance at the navigation locks and at Pack's Ferry gage is the amplitudes in feet. Stages in feet are of a pretty close order of reliability.

Q. Take #4, how about it in feet, when did you discover these errors you speak of?

A. We have had doubts about them for a considerable period of time, but various things brought out in the suit, in connection with the examination of various witnesses, caused us to make some inquiries and see whether any additional information had been worked up.

Q. Didn't Professor Thomas testify at Radford it was 1620 second foot days?

A. He gave the same figure I have here, and that is what appears on the face of the chart. That he did not use at his control gaging stations in his integrating model. He was concerned with amplitude in stage at those points.

Q. Isn't the real question the amplitude in volume rather
2684 than stage, when it comes to navigation?

A. I don't think it makes a hoot in Hades what the volume is as long as it is spread out over a period of twenty-four hours. One can stand on the river and wear one's eyes out waiting for the river to rise. It is the amplitude that counts.

Q. Might you not, with your trained eye, not be able to see the river rise, and still a volume down there to cause a disturbance in one of these pools?

A. I would not attribute any importance to my own eyes, they are just normal, and that is true of any one else. Take wave #4 on its amplitude scale on Exhibit #228. It took it something like eight hours to rise something less than three inches, or at most three inches.

Q. It was six tenths of a foot high at lock #2, wasn't it?

A. I was referring to lock #6, if I did not state so.

Q. How about lock #2?

A. At lock #2 it took between five and six hours to rise a total of 45/100 of a foot, a little over five inches.

Q. You could observe it, could you not, it was observable on the records every day, lock #2, one-half foot high, wasn't it?

A. Yes, by plotting any one of these and bringing the horizontal scale together one may make it show up, but to recognize on the river a rise of something under one inch an hour is not possible for the human eye.

Q. At lock #4 it was 7/10 of a foot high, wasn't it?

A. That is true.

Q. And at lock #5 it was 6/10 of a foot high, was it not?

A. I think that was 5/10.

Q. Well call it 5/10.

2685 A. I think it is 5/10. On Government Exhibit #228 the trough is labeled at elevation 10.60 gage reading and at the crest 11.10, and the difference between the two is 50/100 of a foot.

Q. Are you measuring from the line—from trough to trough up to the crest?

A. I thought we were talking about the variation one would observe standing along the river, and that would just be a comparison with a preceding trough.

Q. Wouldn't the fall be one whole foot, and that being true, instead of 6/10, look at your wave going down the river #5 [interrupted].

A. You are referring to the trough from the crest of this wave #4 to its succeeding trough?

Q. That is right.

A. That is true so far as standing along side it and observing it is concerned, but that trough was not all due to the wave. That water is superimposed on a falling tide of the river. Now it follows also that the rise at lock #5 would have been somewhat greater than five inches, if one spoke technically as to the amplitude of the wave; and that it would measure to be somewhat greater than might make it 5½ inches.

Q. We are pretty nearly in accord then. Now on #6?

A. #6 wave or #6 lock?

A. #6 lock #4 wave?

A. Well the change there is a scant $^3/_{10}$ of a foot, as plotted from the preceding trough to the crest, and it wouldn't make any great difference even if measured from an inclined line which would probably make it a full $^3/_{10}$ instead of a scant $^3/_{10}$ of a foot.

Q. Lock #9, what do you make it there?

A. Well there the conditions were such that the Hunt-
2686 ington District Office and I agreed the wave was
undistinguishable.

Q. It is a fact, isn't it, that wave #4 so far as you state is observable or recorded as far down as lock #6?

A. Yes.

Q. And even these poor waves such as this one, which was apparently shot up perpendicularly, does carry that far down the river?

A. So long as you don't ask me to agree they are poor waves, if you said they were inconsequential [interrupted].

Q. So far as making any comparison with the kind of wave you have been showing us would be propogated at Radford they are practically useless?

A. They were neither inconsequential nor useless.

Q. Let's go to wave #10 a moment. I think you said this morning that there were actions by the rising and falling, or lifting and falling, of the wickets at #6 dam and #7, fourteen wickets, I think raised at #6?

A. Yes.

Q. So there wasn't any interference until you got down to #6 on this wave #10, was there?

A. I believe that is true.

Q. How many wickets are there at lock #6, if you know?

A. I don't know off hand.

Q. Isn't it about 139 or 140?

A. I don't know the number of wickets that were shifted, but such as definitely affected the water level in the river, otherwise those wickets would not have been shifted. That is a routine operation of that particular dam.

Q. In response to a question of counsel I think it was this
morning, you gave the average reduction in amplitude of
2687 all the waves, I think there were seventeen, I am not cer-
tain about that——

A. Eighteen I believe.

Q. You gave that as five inches, did you not, or five and one-half, or something of that kind?

A. I intended to state and believe I did state that the amplitude in inches as shown by the eighteen waves on the average at lock #2 on the Kanawha River was approximately five inches.

Q. That being so, and assuming now the operation, construction and operation, of the London dam, without a draw-down, would it not seriously affect, such a wave, seriously affect navigable conditions in the London pool?

A. I believe it would not.

Q. The word has been used here by your counsel several times as to whether the pool was kept or these pools were kept at a "mathematically accurate elevation." Do you understand whether they are or not?

A. I understand they are not.

Q. What variation is permitted by the Government in the Marmet pool, if you know?

A. 3/10 of a foot, that is below. Then actual variations take place above. That is merely a temporary working basis.

Q. How much above, what variation above?

A. There is no fixed limit.

Q. What is the ordinary variation above the ordinary pool level, if you know, of the Marmet pool, due to ponding from the London pool?

Q. Don't you know the Lock Masters down on both the London and Marmet, particularly the Marmet, are under command that the moment that pool level drops 1/10 of a foot they are ordered immediately to rectify it?

A. Presumably by opening a gate at London.

2688 Q. Any way [interrupted].

A. I do not—I don't believe it is true.

Q. And if it goes 1/10 of a foot above normal pool level they have the same order?

A. Well they have an order to keep the pool at approximately the normal level on the upper side. I think they would endeavor to keep it within a range closer than 3/10 and I believe that ordinarily they do. There have been various times when the amount over the gates was greater, I don't recall any recently greater than about 15/100 or 2/10 but as to variations lower than normal pool level in the amount of 3/10 of a foot I do not believe it is a fact there are instructions to the Lock Masters at London to release water from the London plant as soon as the Marmet pool is as much as 1/10 or 2/10 of a foot, or even 3/10 of a foot, below the normal pool level, nor is there any instruction to the power company that it shall release water under those conditions from London.

Q. What is the normal pool level of the Marmet pool?

A. In terms of elevation above sea level it is 590 feet.

Q. Is that an even figure?

A. Yes, sir. I might say that regardless of what the instructions are to the various Lock Masters and gate operators, that it is just not physically possible to keep the pools at an absolute level.

Q. But are they not ordered to keep it as close as possible, even to a mathematical point, if they can?

A. Not for that London pool and its three-tenths.

Q. How about Marmet?

A. I should have said Marmet pool and its three-tenths, and, of course, at London the variation is three feet, plus whatever the variation on the upper side above the pool level may be.

2689 Q. I think you said, Colonel, that you were instrumental in negotiating the contract for the establishment of the power plant and the regulation of stream flow and all that went with it at the Marmet dam. Am I correct about that?

A. I participated in that negotiation in my engineering capacity.

Q. Wasn't allowance made there of 250 second-feet for lockage upon which you computed your figures for the rental?

A. There is, of course, no contractual arrangement in that respect at all. The fact is that when the economics of the problem were figured at the various offices of the War Department, particularly at the District Office, there was an allowance for leakage and lockage made in the total of 200 or 250 second-feet. I do not recall which, an allowance in the sense that their estimates of total flow, volume of flow, or rate of flow at any given time, were reduced by 200 or 250 second-feet, so as to reach a figure which they felt surely would represent availability for power purposes.

By Mr. THOMPSON:

Q. I wish that you would turn to Government Exhibit 156. For the record, I should say that this is the hearing before the State Corporation Commission of Virginia held July 28, 1932, Ex Rel Appalachian Electric Power Company, Application for License to Construct a Hydro-Electric Development on New River near Radford, Virginia. Turn to page 56 and I want to read to you from a paragraph there. The heading of the page is "Scheidenhelm."

"A. We propose to install four vertical shaped hydro-electric turbines. Each is to have a rated capacity of about 26,000 horsepower at approximately 110 feet net head with a combined capacity for the same rating of approximately 104,000 horsepower. When operated at that head of 110 feet, and at the point of maximum efficiency, these turbine are intended to utilize

2690 about 9,000 second-feet of water, which is about 2.7 times the average flow. When the turbine gates are fully opened and 110 feet of net head is available, the consumption of water would actually be about 10,000 second-feet or, roughly, three times the average flow of 3,300 second-feet. That is one reason—that is the reason—why it seems unnecessary to provide for any enlargement in the future. The relation of the proposed installation to the stream flow is beyond that which is ordinarily installed in a development of this kind. It is made possible by reason of the large power market of the Appalachian Electric Power Company." Did you make that statement before the Commission?

A. I think I made it in that general form, although there are some stenographic errors in it.

Q. Looking at the bottom of page 57: "Q. I would like to ask you for your expert opinion with respect to the adequacy and suitability of these proposed structures, for the efficient utilization of the water power which is available here, with a brief explanation in support of your opinion. A. That question might well be answered in two parts. The first part, referring to the capacity of the power plant, has in reality already been answered; that is, the hydroelectric units will be of sufficient capacity to utilize water in an amount three times as great as the average stream flow and that is a ratio which is well beyond ordinary possibilities. That is due to the fact that this large power system can absorb a development from this power station. The second phase of the answer to the question has to do with the character and efficiency of the equipment. As to that, I may say that the intention is to have turbines of highest efficiency and that efficiency will be well above 90 percent, and likewise the generators, which efficiency will be well up to 96 or 97 percent, so that once the water reaches the turbines it will be used to the very greatest efficiency." Did you make that statement?

2691 A. I think I made it in essentially that form.

Q. On page 81: "Q. Will you state what recreational, scenic and commercial benefits may be expected to flow from the construction of the project reservoir? A. The reservoir will be, in effect, a lake, a fresh water lake, which by reason of its geographical location, will make it unique. Also its size will make it unique. It will be the largest lake in Virginia. It will be close to an important highway, the Lee Highway. It will have no near competitor, no practical competitor at all by way of a lake for recreational purposes in that part of the country. The nearest large bodies of water, I believe, are all artificial and are a substantial distance. West Virginia has no body of water so large. In North Carolina there may be some on the other side of the mountains. Lakes of this kind are found to be used very generally for recreational purposes, particularly in the summer time for swimming and boating and fishing." Did you make that statement?

A. I believe I did.

Q. Then you make a reference to the Lake Lynn Development on Cheat River. How long is it since you have seen Lake Lynn?

A. Several years.

Q. There is a very active boating on there now, is there not, by motor boats and other boats of that kind?

A. I have no knowledge of that.

Q. Turning to page 92: "What is your opinion of the question as to whether or not this project will involve unreasonable interference with stream flow? A. Any dam that is put across a stream and has gates in it involves some potentiality. However, the applicant realizes that there must be no unreasonable interference with the stream flow and has made the investigation up to this point, and expects to make further investigation if 2692 permitted, with the positive realization that there must be no unreasonable interference with the stream flow but in that connection I would like to point out that this project is unique, very unique, in that there is a source of water supply immediately downstream from the dam which in itself is partly marketable." Did you make that statement?

A. Certainly not in that form.

Q. What form did you make it in?

A. I don't know.

Q. Is there anything wrong with the statement or did I read it incorrectly?

A. No, but the Court Reporter must have taken it down incorrectly—not the Court Reporter, the Commission Reporter.

Q. Wherein is it incorrect?

A. Well, the last thing that caught my attention was "marketable." That certainly doesn't belong there.

Q. Is that the only correction you would make?

A. Well, I don't know. I would want to study that.

Q. What word do you think you used?

A. I don't know.

Q. Would you say that substantially what I have read you said?

A. I am inclined to think that the general import is correctly conveyed.

Q. Did you have corrections made of the record after the hearing?

A. This doesn't look like it, and I don't recall any.

Q. Did you get a copy of it?

A. Well, I probably did but these commission records come along a long time afterwards and certainly I could not

2693 have seen this and made any corrections in the record. I could not have seen the original transcript of this.

Q. Would you suggest where you would correct it, what words you would correct?

A. Well, I don't suppose I ought to be put in the position of giving my testimony over again. I have stated that the general import, I believe, is correct.

Q. (Reading on:) "May I call the Commission's attention in that respect to Exhibit B. Just downstream from the dam site as shown on Exhibit "B", distant a half mile, is an influent tributary of New River named Little River. It empties into New River within the limits where riparian ownership is in the applicant or its affiliated corporations. That stream has a drainage area of a little over 300 square miles. At the gaging station at Grayson (I understand that is Graysonton) the drainage area is, I believe, 302 square miles. It's low water fall is remarkable (I rather imagine the word 'fall' should be 'flow'). It has been gaged and measured and is being measured by the Water Resources Branch, or bureau, of the State Commission on Conservation and Development, and, according to the records of that Commission, in the low water season of 1930, which was practically the same in its effect on the water supply as the low water season of 1925, the minimum flow of Little River was 77 cubic feet per second. That flow persisted for only a day or two. In fact, for the five days centering upon the minimum flow the average stream flow was reported by the Commission's Engineers as being 95 cubic feet per second, 118, 77, 82 and 80 second-feet respectively. The following day the flow went up to 159 second-feet." Did you make that statement?

2694 A. Well, it sounds as though I made it. I don't know about the figures, whether they were taken down correctly.

Q. I want to call your attention to a hearing before the Public Service Commission of West Virginia, page 1548, West Virginia Power Company application for permit to construct dams on New River for hydro-electric purposes, and I am reading from Government Exhibit 253 for identification, from page 107: "Q. What have you to say as to the advantages or the disadvantages of the amended application of two dams over the original plan with one dam? A. The following considerations appear to me to be outstanding and they are all advantages in favor of the change from one-dam scheme to a two-dam scheme of development: First, the Bluestone project in its original form would have been economically feasible only after reliable examination, that is, after reliable examination for carrying big peak loads. Of necessity, this would have resulted in greatly fluctuating stream flow in New River down-stream from the power site, and, in particular, from the power site and the junction of New River wtih Gauley River, or, in other words, the head of navigation on the Kanawha River." Did you make that statement?

By Mr. Jackson. I object to the question. The witness was cross-examined about this this forenoon and this isn't contradictory of anything he has stated.

By Mr. Thompson. I didn't cross-examine him on that at all.

By Mr. Jackson. You cross-examined him about the plans.

By the Court. I will let him answer that question.

By Mr. Jackson. Let our exception be noted.

A. I undoubtedly testified on that subject matter but it certainly is a garbled record.

By Mr. Thompson:

Q. You don't think that stated your views then, do you?

A. Well, I think there is some import that would come from it in spite of all the garbling.

Q. You have got a copy of it there, haven't you?

A. Yes.

Q. Where did you get that copy?

2695 A. We got that from my office and it got to my office from the Public Service Commission of West Virginia.

Q. Did you ever ask them to make any changes in that record?

A. Not within my knowledge.

Q. You read it after you got it, didn't you?

A. Not within my knowledge.

Q. You just made this statement and then went away and never afterwards looked at any record of what you had said before that Commission?

A. I don't know whether I did or not.

Q. I am reading from page 108. [Reading:]

"Secondly, it is believed by me, from the standpoints both of down-stream riparian owners and water power developments, and also of the best interests of navigation on the Kanawha River, the applicant power company would not be justified in taking the risks of constructing or attempting to construct the original single stage Bluestone project, with its 140 ft. dam at the Hinton site, in as much as that dam and power station, and in particular the operation of the power station, would be dependent upon the legal right and the practical ability to operate that power station primarily for carrying peak loads. The carrying of the peak loads means fluctuating output from the power station."

Q. (Continuing) Did you make that statement?

A. I believe I did.

Q. What do you mean by the words "legal right"—"dependent upon the legal right?"

A. That is six years ago. I would have to guess what I meant by it then.

2696 By Mr. Thompson:

Q. You said it was dependent on the legal rights. You mean they had doubt about it?

A. Probably the principal things were that there might be rights of the downstream riparian owners.

Q. But that description of the power station carrying peak loads, that is your view, is it?

A. It being the intent that carrying peak loads and fluctuating output are synonymous. It does not necessarily mean the top of the variable load.

Q. You used the phrase big peak loads. What is that?

A. That proposed power station, whether it be a single stage or at Bull Falls—a big hydroelectric station with a capacity as compared with the Radford plant here from 70% to 100% greater.

Q. You didn't intend to have a peak load at the Hinton reservoir, did you?

A. If you mean the Hinton development of the Bluestone power project divided into two parts, no; if you refer to Hinton dam as being erected at the Bluestone site, and I note I used the words "with its 140 foot dam at the Hinton site," the answer would be "Yes."

Q. You mean a big peak load at the Hinton site?

A. Yes, sir.

Q. On page 109, I read as follows [reading]: "Thirdly, under the present scheme of development, which is the scheme proposed in the amendment of application, such peak load operation, with extreme variation in water output from the power station, can be carried on to the maximum practical degree at the upstream or Bull Falls development without any resistent interference
2697 with the rights of riparian owners or with navigation or
the navigable capacity of the Kanawha River. The operation of the Hinton development will be subject to the necessity of re-regulating the discharge of water from the Bull Falls development, and it has the function of operating and will be operated so as not to interfere substantially with navigation on the Kanawha River or with the rights of downstream riparian owners."

Q. (Continuing.) Did you make that statement?

A. I did, I believe, in essentially that form. There are errors in it.

Q. Is it your understanding that a reservoir of the type of Bull Falls, if you did not have a re-regulating reservoir, that it would endanger navigation below?

A. I do not think that that has relation to the fact that Bull Falls has a reservoir or that there is one there, but rather to the question as to the capacity of installation which was proposed there and the use proposed to be made of it, and its location with reference to down stream riparian owners and the navigation of Kanawha River. For instance, the Bull Falls development would have a water capacity of about 15,500 second-feet at the point of maximum efficiency of its power installation, when the Hinton reservoir—that is the Hinton re-regulating reservoir is filled; about 16,000 or more, with the Hinton re-regulating reservoir drawn down. It would be as much as 18,200 second-feet when the Hinton reservoir is down but with the capacity at Bull Falls operating at full gate. That is a great deal of capacity to be thrown into a stream when the distance from down stream riparian owners is only about 10 miles to the nearest ones, and there are various ones located in a distance of 70 miles 2698 and the head of navigation is a distance of only 80 miles.

Q. Is it your understanding that, if they had a dam at Bull Falls, and were running at peak load, and they had no reregulating dam below, it would affect navigation?

By Mr. Jackson. We object to the question, unless he specifies the size of the reservoir.

By Mr. Thompson:

Q. Taking the size of the reservoir described here. It was before the Commission.

A. There is still another factor, speaking of navigation.

Q. No, sir; can you answer that question "yes" or "no"?

A. No, sir.

Q. Read the question and see if it is not susceptible of such an answer?

(The question is read.)

By Mr. Jackson. Show that the question was amended to show that you mean the size of the reservoir at Bulls Falls.

By Mr. Thompson:

Q. A reservoir of the Bull Falls size?

By Mr. Jackson. And the same size of machinery.

By Mr. Thompson. Yes, sir.

A. One needs to draw into the answer the nature of the navigation facilities, on the Kanawha River.

Q. I don't think so. I did not ask you about the Kanawha River.

A. But I must make the answer.

Q. You must make the answer, but that question is simple enough for you to answer.

A. Not without a qualification as to the kind of navigation facilities.

Q. Do you object to making an answer?

A. Yes, sir.

By Mr. Thompson. All right, the record will show that.

By Mr. Jackson. Let the witness answer the question. He says he cannot answer it "yes" or "no."

By the Court. He says he cannot answer it "yes" or "no."

By Mr. Jackson. He should permit him to answer it, however.

By Mr. Thompson:

Q. Assuming a reservoir the size which you were desirous of getting a license for at Bull Falls—that is, your company; and assuming it to be operated as you described it to the Commission in West Virginia—if it were operated at peak load, would that effect navigation down below on the Kanawha River?

A. You are asking or referring to navigation facilities as they existed in 1930, at the time of this testimony?

By Mr. Thompson:

Q. Well, say in 1930, yes.

2699 A. That is, with the old wicket type dams?

Q. Yes, sir.

A. That had potentialities of affecting navigation.

Q. Did it have potentialities for doing so, or would it actually affect navigation, according to your views, if they had London and Marmet and Winfield dams completed?

A. I don't know; I have not studied that.

Q. I will read from page 127——

A. (Interrupting.) I am inclined to think it would have some potentialities, under those circumstances.

Q. I will read from page 127 here [reading]:

"Q. Please describe the method of operating "dams in generating plants?

"A. That may involve to some degree repetition of what is contained in amendment of application on my earlier statement. The function of the downstream development is to turn out water in a reregulated or relatively equalized manner. The need for it arises from the plan of operating the upstream or Bull Falls development in such a way as to carry peak loads. The carrying of peak loads is an economic necessity. That is the project cannot be justified unless it does that. By the carrying of peak loads means the operation of a power station intermittently or at least with great variation, as compared with what we style a base load or uniformly operated power station."

Q. (Continuing.) Did you make that statement?

A. I believe in essentially that form, yes.

Q. On page 128, I read as follows [reading]:

"The Bull Falls power station can be expected to operate during the hours of maximum demand upon the power system
2700 into which it is to feed practically those hours or the daylight hours, the working days, outside of those hours, perhaps, even during the noon hour"——

By the WITNESS. That read [indicating paper] "ourside."

By Mr. THOMPSON. That has been corrected to read "outside." [Reading] "perhaps, even during the noon hour, the output of power from the Bull Falls station will be curtailed or even cut down to zero. That means the outflow areas, but that intermittent output from the Bull Falls development will empty directly into the reservoir of Hinton development. In the Hinton development that water will be re-regulated. That is, although there will be a varying quantity put into the reservoir, the output will be relatively regular and uniform compared with the input. It is a necessary characteristic, as I believe I pointed out, that the downstream reservoir, re-regulating reservoir, shall have sufficient storage capacity to allow for the accomplishment of that result. It does have that necessity. In brief, then, the method of operating the project will be to operate the Bull Falls development intermittently as a peak load carrier, and the down-stream plant, that is the Hinton power station, with relative uniformity."

Q. (Continuing.) Did you state that?

A. I think essentially in that form. I think in the next to the last sentence, the word "necessity," is an error, and that should read "capacity." There are probably other errors in it, but the general purport is what I stated, undoubtedly.

Q. You agree with the statement or say that you made
2701 the statement "the output of power from the Bull Falls station will be curtailed or even cut down to zero," page 128?

A. Under the circumstances, yes; if there was a power station near which could go to zero, it would be Bull Falls, with a re-regulating reservoir.

Q. I read at page 130 [reading]:

"For instance, the parent of the applicant company, the Appalachian Electric Power Company, has nearing completion plans for a power development at its so-called No. 6 site in Virginia, in Pulask county, upstream from Radford. It is proposed there to make a development which, in the general characteristics, will be much like the Bull Falls development. The storage capacity is proposed to be 100,000 acre-feet. That is enough water to cover 100,000 acres to a depth of one foot. That may be compared with the capacity of the Bull Falls, in the amount of about 125,000 acre-feet, that is, that this Radford development alone will have about 80 per cent of as much as Bulls Falls. In addition it is logical to assume that there will be further development of storage upstream from the Radford power site in Virginia."

Q. (Continuing.) Did you make that statement?

A. I believe I made that in essence.

Q. If the Bull Falls project, being of similar construction and general characteristics, has need of a re-regulating reservoir, wouldn't the Radford project have need of a re-regulating reservoir?

A. That does not follow at all; no, sir. There is a distinct difference in that. The general characteristics are the same in that the height of the dam is sufficient in each case so it will be called a high dam, as compared with the Hinton re-regulating 2702 reservoir dam, which is only about 45 feet high and would be called relatively low—a relatively low dam. Certainly, so far as the dam is concerned, you would not say that the Hinton dam has the general characteristics of the Radford dam. The Bull Falls development is of the same general nature. The heights of the dams are roughly 118 feet, as compared with 143 feet. The reservoir capacity is not so tremendously different between Bull Falls and Radford, but Hinton would be entirely different in characteristic, as regards reservoir capacity.

The water capacity of the two stations, as proposed, would be radically different. Radford was proposed for 9,000 second-feet capacity.

Q. Are you reading from something?

A. From some figures that I have, yes.

Q. You are reading from notes, not simply figures, are you.

A. They are figures that I am reading. [indicating paper.]

Q. Where did you get them?

A. From an assistant.

Q. Where?

A. From an assistant that I had make them up for me.

Q. Who is the assistant?

A. It happened to be Mr. John Snethlage, in this case.

Q. He made them up yesterday, did he?

A. No, some of them were made the day before yesterday, and yesterday.

Q. Since we have examined Dr. Mead?

A. That is true, yes, sir. May I complete my answer?

Q. It would be better if you would complete it without reading from that paper.

By the COURT. He could not be expected to carry it in his head. He may read it.

A. I am not reading anything but the figures, which I do not carry in my memory. I was coming to the water—to the 2703 comparison of water or the discharge capacity. The Radford project is to be at a point of maximum efficiency at a capacity of approximately 9,000 second-feet; whereas, Bull Falls development would have a capacity varying from 15,500 to 16,200 second-feet, at the point of efficiency, the variation depending on the stage of water of the Hinton reservoir, so that the Bull Falls development has about ⅔ or is about ⅔ greater in its discharge capacity than Radford. That difference in reservoir capacity is not material, because, so far as the variable load or peak carrying load is concerned, all that is necessary is that there be sufficient water for a day or a few days pondage, and there is more than a few days in each.

2704 Another factor is the proximity of the Bull Falls development to Hinton and the possible trouble as regards down stream riparian owners or still further down navigation works. The Bull Falls development is within about 10 miles from the nearest power development of any other interest down stream, whereas, the Radford development is something like 90 miles away from it. Comparing distances from the head of navigation on the Kanawha River, Bull Falls development would be a distance of 81 miles and Radford twice that far, and then as regards this distance there is the further fact that the steepness of the slope from Hinton to the Kanawha River is substantially greater than is the slope from Radford to Hinton or the Bull Falls site, and that has a definite effect upon the travel of power tides,—power tides would flatten out more in the upstream stretch than in the down-stream stretch. Moreover, in 1930 wicket dams were in existence on the Kanawha River, and there was not an authorization of funds for construction of new navigation dams, and the wicket type dams, to the extent of eight on the Kanawha, were, therefore, very much in the forefront. With the Radford project, all have been displaced or will be by the time the project goes into operation. The statement that I made before the Public Service Commission of West Virginia took into account primarily the necessity as a business proposition, as I saw it—that there would be a change in the form of the development, and that was from a single dam, not at Bull Falls but at Hinton, which meant a proximity even greater to the interests generally down stream.

By Mr. **Thompson**:

Q. Are you through?

A. There is just one other point to be put into the picture and that is that the Bull Falls reservoir is located immediately adjacent to a re-regulating reservoir, and can be operated with-
2705 out consideration of any down stream rights whatsoever, because nothing intervenes. The water out of Bull Falls would empty into the head water at Hinton. In the case of Radford, there intervenes a great stretch of river, and there is within that stretch quite a difference from what there is below Bull Falls; there are various riparian considerations to be taken into account: One is Narrows stream plant of the Virginian Railway Company, of a capacity of 40,000 kilowatts, which depends for condensing water on the New River.

Another is the Glenlyn steam plant of the Appalachian Electric Power Company, that has about 80,000 kilowatts, that is likewise dependent on the flow of New River for condensing water.

To be sure, in the latter case, there is no diversity of ownership, but there is certainly an absolute need of keeping enough water in the stream to provide circulating water for a large steam station.

Q. Do you speak with the authority of the corporation which you represent, the defendant, when you say, if I understand you, that, if the Government does not build this project, and your company is successful in this litigation, that your company will build it?

A. I see you do not distinguish between myself and that company. I am not a general agent for that company.

Q. You said yesterday——

A. I have not finished.

Q. You said yesterday that, if the Government did not build it, you people would build it—this company?

A. I did not use any words, I think, that were equivalent to "we people"; but in my opinion, from the status of the project, the money spent on it, the recommendations that I have made,
2706 and the manner in which these recommendations have been received, the growth of the system load—all of these things tell me that the project will go on to construction—would have gone on with construction in 1930, had the license from the State of West Virginia been granted.

Q. Why has the Company been fooling with this project since 1912, and not gotten to the construction of it?

A. Well, it was not this company that did the fooling, if fooling was done. There were questions of State laws affecting that; the diversity of ownership and contentions that were not reconciled until the mergers in 1925 and 1926, in which the Appalachian Electric Power Company brought together the warring interests, so to speak. It takes a long time to put a large water power development into operation or being. This Radford project was laid out, not in its present form, but was conceived in 1914 or 1915, and is not yet in existence.

Q. You made application about 1924 for a license, did you not.

A. The West Virginia Power Company, prior to my connection with the Company, made application for a license to the Public Service Commission of the State of West Virginia.

2707 By Mr. Thompson:

Q. You said, on page 6299 of this record, in your testimony, as follows [reading:]

"Q. State if you know whether or not this Bluestone project of the West Virginia Power Company is still included in the plans of the defendant and its affiliates with the developing of power stations on New River?"

By Mr. Thompson. And your answer is "Yes."

By Mr. Jackson. That should be "for."

By Mr. Thompson:

Q. It is "with" here. Were you talking with authority or just talking then?

A. I was probably talking with knowledge.

Q. That was with knowledge of the plans of the company.

A. As they existed then.

Q. What I mean is, it was yesterday that you were talking?

A. I beg pardon; I thought you were quoting from the other transcript.

Q. This was yesterday.

A. I thought you were quoting from the transcript of the Public Service Commission. I do not understand it.

Q. I read the statement and your answer "Yes"; and I asked if you spoke with authority from the company or just talking as one, Mr. Scheidenhelm?

A. I was speaking with the knowledge which I have gained as a consulting engineer and in quite close contact in that capacity with that particular company and its affiliates.

2708 Q. Do you understand that they will, if they are victorious in this litigation—that they will go forward——

By Mr. Jackson. What litigation?

By Mr. Thompson. The litigation before Judge McClintic right now.

A. In the broad sense, they will go ahead and build. As to the fact of whether they will go on in a week or a month or a year after the situation is cleared, I am not prepared to say that. No one would know that under the present status, when the water is so troubled.

Q. On page 138, I read.

A. Which record?

Q. Of the West Virginia Commission record. [Reading:]

"Q. I still don't catch your idea, Colonel. Do you mean to say that if the water is not necessary to carry the peak load that you would let the water down through the dam during the dry period in order to keep the normal flow going."

By Mr. THOMPSON. And your answer. [Reading:]

"That might be the case, and the power company might be altruistic enough for that, but the fact is there is a need for the peak load and the operators of the power system would only be too glad if they had more water available. They are limited by the available water."

"Q. That would depend on the demand for power, wouldn't it?

"A. But that cannot be conceived, reasonably, even in times of business depression, not to require all the output possible."

2709 By Mr. THOMPSON:

Q. (Continuing.) Is that a statement of yours?

A. Yes, sir; essentially that.

Q. I am reading from page 140 of the same record. [Reading:]

"Q. So that coming back to your point, if there were enough water available the power system operators would gladly get more than 50,000 kilowatts capacity out of the Bull Falls development during the low water, so that the water that is turned out will not be turned out for any altruistic motive, it will be turned out to generate energy. The load would demand it; it would be economically advantageous to do it. Now, the result of this upstream storage will be to make more water available. The Radford project is to go to construction practically concurrently with the Hinton development, assuming this Commission grants the license. They are economically related, as is the Bull Falls Development. Have I made myself clear?"

By Mr. THOMPSON:

Q. (Continuing.) Did you make that statement?

A. I think I did in essentially that form.

2710 Redirect examination by Mr. JACKSON:

Q. Col. Scheidenhelm, on cross-examination the Government had you identify, and offered in evidence as Government Exhibit 256, a letter dated October 16, 1931, written by you to Major Herman, District Engineer, Huntington, West Virginia, inquiring whether there had been any difficulty in maintaining pool level on the Kanawha River in 1930, and asked you whether you received any reply. I now show you a letter dated October 20, 1931, addressed to F. W. Scheidenhelm, signed by

United States Engineer Department, by F. B. Davis, and already marked "Defendant's Exhibit 514 for identification," his signature having been identified by the Government witness Teeter, and I ask you whether that Exhibit 514 is the reply which you received to Government Exhibit 256?

A. It is the reply.

Mr. **Jackson.** We offer this Exhibit 514 in evidence. I will read it: "In reply to your letter dated October 16, 1931, regarding difficulties experienced in 1930 in maintaining pool levels above Dams Nos. 2, 3, and 4 on Kanawha River, you are hereby advised that difficulties were experienced in maintaining pool levels above Nos. 2, and 3. However, the deficiency in pool levels was not due to the low discharge in the river, but to missing timbers and stone filling at the tops of the fixed crib dams. After repairs were made, the pools were a little low at times, due to leakage through the old crib dams. No particular trouble was experienced in holding pools above movable dams below, though considerable caulking was required to prevent excessive leakage."

At this time I produce and ask to have marked for identification House Document No. 306, 74th Congress, First Session, entitled: "Ohio River. Letter from the Secretary of War transmitting, pursuant to Section 1 of the River and Harbor Act approved January 21, 1927, and Section 10 of the Flood Control Act approved May 15, 1928, a letter from the Chief of Engineers, United States Army, dated August 14, 1935, submitting a report, together with accompanying papers and illustrations, containing a general plan for the improvement of the Ohio River for the purposes of navigation and efficient development of its water power, the control of floods, and the needs of irrigation."

(**Note.**—This document is filed marked "Defendant's Exhibit No. 601 for identification.")

Mr. **Jackson.** I would like to withdraw Exhibit 514 and substitute a photostatic copy.

From page 146 of "Defendant's Exhibit 601 for identification" I offer in evidence paragraph 263 [reading:]

"263. Low water flow. The flow of the Ohio River was, in general, lower during the fall of 1930 than it has ever been since records of this nature have been kept. Table 45, appendix A, part 4, contains estimates of low water flow at all dams in the section of the river under consideration." A foot note shows Table 45, appendix A, "Not printed."

I now produce a photostat bearing the title at the top, "Table No. 45. Low water flow—Ohio River, regulated by reservoirs under Plan 1," and ask to have it marked "Defendant's Exhibit 602 for identification."

(**Note.**—The paper referred to was so marked.)

By Mr. **Jackson**:

Q. Col. Scheidenhelm, I show you Defendant's Exhibit No. 602 for identification, and ask you whether that is a photostatic copy of Table 45, Appendix A, referred to in paragraph 263 of Exhibit 601 for identification.

A. It was furnished to me by the office of the Chief of Engineers of the Army as such, and it bears all the earmarks, and I accepted it as such.

Q. Was that delivered to you by the Chief of Engineers in response to your request for that information?

A. It was.

Mr. **Jackson**. We offer in evidence this Exhibit 602.

Mr. **Thompson**. If the Court please, we have no objection, subject to examination, to this exhibit being marked for identification at this time.

We would like to look it over.

By Mr. **Jackson**:

Q. Col. Scheidenhelm, during your cross-examination you were asked whether, in particular, waves Nos. 1, 2, 3, and 4 of the 1930 wave tests were not rectangular in form with substantially perpendicular faces. Is that a fairly accurate description of those waves as they were initiated?

A. Quite so.

Q. State whether or not in your opinion there is any
2711 other form of wave with the same volume of water which
could produce any more severe effect in passing
downstream?

A. Speaking of form of wave at the point of propogation, waves which have form other than rectangular, and particularly triangular forms, tend to lose amplitude and volume more rapidly than do waves of the rectangular form. That is the most severe form.

By Mr. **Jackson**:

Q. What relation does the present answer you have just stated have relative to the persistency of the wave?

A. The wave which in its original form of propogation is of the rectangular or block form, tends to be more persistent in its travel down-stream as compared with the travel from the same point of initiation through the same course and with the same volume of a wave of a different form.

Q. Taking into account all of the means of wave propogation available to you at Byllesby and Buck for the purposes of these 1930 tests, could you have caused the propogation of any waves which, in their effect on the Kanawha River, would have been more severe than those which were actually propogated during those tests?

A. It was the intention to set up the most severe condition. As far as I knew then, and as far as I know now, the available facilities by way of power station, or reservoir, or pondage, and taking into account water supply, does not permit the doing of anything by way of wave propogation which would have had a more severe effect in the Kanawha River.

Q. How does the volume of wave 11, in the 1930 tests, compare with the discharge shown on Defendant's Exhibit 594?

A. By wave No. 11, I presume you mean the large wave centering on March 22 at Ivanhoe?

Q. That is what I understand.

A. At Ivanhoe, that wave had a volume almost equal to the total volume of discharge shown for the Radford power station
wave, exhibited as No. 594. That is, the latter has a volume
2712 of 3,000 second-feet days; the wave of the 1930 series had a
volume of 2,900 second-feet days; wave 11 had a volume substantially greater than the daytime portion of the Radford discharge on Exhibit 594. Actually, wave 11, as shown by Government Exhibit 227, was preceded in point of time by a small wave centering approximately on midnight of March 21–22, and that small wave approximates, to a substantial extent, the evening portion of the discharge shown on Exhibit 594.

At Ivanhoe, that small wave had a volume of approximately 500 second feet days. Thus that small wave, plus the succeeding wave 11, had a combined total of 3,400 second-feet days, which volume compares with the 3,000 second-feet day volume of the form of discharge for the Radford power station shown on Exhibit 594.

Q. Have you finished your comparison?

A. I have.

Q. On your cross-examination you testified that the average amplitude in stage of the 18 waves of 1930 tests, at Lock No. 2 on the Kanawha River, was approximately five inches. What was the average period of time which these waves required to rise the five inches in amplitude to which they attained at Lock No. 2?

A. I do not have the figures for the 18 waves because four of the 18 (13–A, 13B, 14–A, and 14–B) were practicalyy negligible at Lock No. 2. However, eliminating those four waves and treating the remaining fourteen, I find the average time of rising for the fourteen was about five and a half hours, and the average time for the fall was nineteen hours. That is the average duration of the fourteen waves was twenty-four and a half hours, approximately. Another reason for eliminating the four waves which, on Exhibit 227, are designated 13–A, 13–B, 14–A, and 14–B, is they were propogated near twelve hours apart, and in that respect differ substantially from the periods of propogation of the remainder of the number of waves.

By Mr. **Jackson**:

Q. How does the total average duration of the fourteen waves compare with the periods of release of possible power tides at Radford?

2713 A. In general, power tides which might be released at Radford would be twenty-four hours apart. That would obtain during all of the successive days when waves are released; or, to put it more accurately, when there is a variable flow discharge carrying some part of the system peak.

Q. Then would the comparison be between the 24½ hours and the 24 hours in that respect?

A. Yes; it would be on that basis. It just happens that the average interval between the release of waves at Buck and Byllesby for the fourteen I have mentioned is just a trifle over 24 hours.

Q. What was the average length of those fourteen waves of the 1930 power tests at Lock No. 2?

A. About 100 miles.

Q. Have you a chart which would graphically illustrate something of the actual form of these so-called power waves or tides at Lock No. 2?

A. We have a chart which depicts a wave on a full size vertical scale.

The **Court**. Are you not going back to the direct examination?

Mr. **Jackson**. I do not think so, but this is the last question I have on waves. It is only intended as illustrative, but if the Court thinks I am going too far, I will not press it.

Mr. **Thompson**. I object to any testimony with regard to the exhibit which it is proposed to introduce, as going beyond the limitations of redirect examination.

Mr. **Jackson**. All right. The defendant offers at this time, as a part of its re-direct and explanatory of the cross-examination as to the form of the so-called tides or waves, to prove graphically through this witness that such power tides or waves, when plotted in accordance with their actual size and form, will show a total rise at Lock No. 2 of possibly four or five inches, with a length of approximately 105 miles, so that the true picture of the wave will be a picture of a wave 105 miles long, rising over a period of many miles to a maximum height of four or five inches and receding over a distance of many miles to the original level.

Mr. **Thompson**. We object to counsel's description, as it is not based on the testimony in this case.

The COURT. That is what he is offering to prove.

Mr. JACKSON. I assume that offer is declined, and that we have our exception?

The COURT. Yes.

By Mr. JACKSON:

Q. On your cross-examination attention was directed to Government Exhibit 226, and particularly to the computed output from the Radford station for five week days as shown on that exhibit; will you please state what volume of water is included in the discharge of the Radford station, as shown on Government Exhibit 226, for each of the week days?

A. For Monday, October 24th, 3,620 second-feet days, approximately; Tuesday, 3,750 second-feet days; Wednesday, 3,900 second-feet days; Thursday 3,620 second-feet days; Friday, 3,400 second-feet days. Those are approximate figures.

Q. Col. Scheidenhelm, I show you Government Exhibit 229 and Government Exhibit 230, and ask you to state briefly whether there are any errors in those exhibits?

A. I find some discrepancies in them.

Q. State them briefly?

A. Some of the discrepancies I find have already been referred to in the testimony, and I shall not touch upon them unless 2714 counsel desire it. In addition, in the lower diagram on Exhibit 229, comparison of that exhibit with the original automatic gage chart, shows that the pool level at the upper end of pool No. 6 has been plotted uniformly at a level one-half foot below that actually shown by the chart.

In the case of Exhibit 230, I find apparent errors in the plotting of the elevation at Marmet dam (that is at the upper end of pool No. 6), for each of the respective times indicated. In one case, the error is of what I would style negligible extent; In the other cases they are not negligible. The maximum is about 1.3 feet.

Q. That is the nature of the errors? Are they in connection with the levels?

A. The elevations I find to be incorrectly plotted, a part of the error lying in the fact that chart 229 has been plotted one-half foot in error from the original gage chart, and the remaining errors I cannot account for.

Recross examination by Mr. THOMPSON:

Q. Colonel, on Government Exhibit 229, about which you have just testified, and on which you say there is an error, is that error of any consequence with relation to the purpose for which this exhibit was introduced?

A. As far as concerns the plotting of the upper end of Dam No. 6 pool on Exhibit 229, I would not consider that of consequence. I do consider it of consequence in that it forms basic data for the plotting on Exhibit 230.

Q. Do you regard what you assert to be an error, carried over from Government Exhibits 229 and 230 with respect to No. 6 pool, to be a serious one, or material, in view of the purpose of this exhibit in this case, namely, to show the profile of the water surface in Marmet pool?

A. Of course, it does not correctly portray the water surface in the Marmet pool, but I would surmise the purpose of Exhibit 230 is to show that fluctuations had occurred in Dam No. 6 pool 2715 due to the operation of the Marmet dam, and, in that respect, the errors are such as do not wipe out the fact that there are such fluctuations due to the Marmet dam, but it does change substantially the quantitative extent of those changes, as shown on Exhibit 230.

Q. The errors which you say appear on Government Exhibit 230 with respect to pool No. 6 do not affect the representation with respect to the Marmet pool, do they?

A. They do not, although in that particular representation there is the error pointed out at some time during the testimony as regards the so-called first oscillation at 4 P. M., which I did not mention this morning.

Q. And that error has been previously alluded to in testimony as two-tenths of a foot, has it not?

A. I believe that is true.

Q. You would not call that material, would you?

A. It is about one-third of the total amount previously shown.

Q. That would not be material, would it?

A. I do not think it is material upon the question that there are no fluctuations now caused in the navigation pools by the Marmet and London dams. It merely has to do with quantitative extent of these variations.

Q. You have reference to Government Exhibit 227. You have just testified, I believe, that wave No. 11 was comparable in volume with the wave on Defendant's Exhibit 594, if you include the preceding wave between 10 and 11; isn't that correct?

A. I believe I stated that the total volume of wave 11, without the small waves, is approximately equal to the total volume of the discharge shown on Exhibit 594. If the small wave be included, then the combined total, as per Exhibit 227, is somewhat greater than the total of the discharge from the Radford station, as indicated on Exhibit 594.

Q. On 11, how long is the time of discharge?

A. Wave 11, as measured at Ivanhoe in terms of ampli-
2716 tude in stage or feet, has a slightly complicating feature at
the bottom of the main wave. If one considers the duration of time just at the top of that small amount of preliminary discharge presumably caused by some discharge over the gates at Byllesby and Buck, the duration would be roughly 12½ hours. If one takes into account that preliminary leakage, one might call it, over the top of the gate, the duration would be about 16½ hours.

Q. And, if you do not take that into account, it is 11½?

A. I stated about 12½.

Q. Now then, on No. 594, it is about 16½?

A. It is about 16½ hours, as I recall it.

Q. Colonel, wouldn't the Radford project be carrying a variable load more than 90 percent of the time?

A. I never made any estimate of it. I doubt that.

Q. What would you say?

A. I say, I never made any estimate of it.

Q. You have thought about it, haven't you?

A. Not in those terms.

Q. What percentage of time does 9000 second feet obtain at the Radford dam site?

A. According to natural flow conditions on an approximate basis a flow of 9,000 second-feet, apparently would exist about five percent of the time.

Q. That would mean there would be a flow of less than 9,000 second-feet for 95% of the time?

By Mr. Jackson: I object to the question as not proper recross examination.

By the Court. He may answer.

By Mr. Jackson. Exception.

A. That is true if under natural conditions, not under operating conditions there, neither the periods of storage in the reservoir or the periods of low flow when there would be draft upon the reservoir—the latter would not affect the situation greatly but the former would. Certainly when a power station such as
Radford has a full reservoir and a flow of around 6,000
2717 second-feet and up, perhaps even 5,000 second-feet and up,
the variable flow set up by that would be comparatively little or nothing. I have not reasoned that thing through sufficiently to express it quantitatively.

Redirect examination by Mr. Jackson:

Q. Col. Scheidenhelm, in connection with the Grounding No. 1, testified to by the witness Elsey, Witness Elsey has furnished data to the effect that this grounding occurred December 28, 1935, at 8 a. m. The tow was four barges, the draft 6 feet, and under the heading "exact grounding" the statement is "ice gorge". Have you investigated the condition of the river and of the operations of the Marmet power station on that date?

A. I have.

Q. Will ~~you describe~~ the condition of the river and the operation of the Marmet power station at a date corresponding to this grounding?

A. Prior to the time of the stated grounding the water levels at the foot of the Marmet dam and locks had, for at least 24 hours, been at a level which, at a minimum, was about 1½ foot above the normal pool level at Pool #6. There was no variable load or peak carrying operation at the Marmet hydro station. The outflow from the Marmet power station was the only power outflow which could have had any conceivable bearing upon the question as to whether the grounding was caused or not caused by power station outflow. That is, the London Power Station outflow could have had no relation. The operations of the Marmet power station could not have been the cause of the grounding.

Q. In connection with grounding No. 5, testified to by the witness Elsey, the witness has produced a statement purporting to come from a record to the effect that this grounding occurred May 20, 1936, at 11:10 a. m., that there was a tow of eight barges, the draft of loading was 6½ feet, and the exact grounding was Lock 10. Have you investigated all the conditions of the river and the operations of the Marmet Power Station at that time?

A. I have.

By Mr. Jackson:

Q. Will you please describe the condition of the river and the operations of the Marmet power station at the time corresponding to the date given by the witness Elsey for grounding No. 5?

By Mr. Thompson. Your Honor. I further object on the ground that he isn't showing the source from which he gets this information.

By Mr. Jackson. At the time the witness Elsey was on the stand he undertook to testify to six alleged groundings of tows in the Kanawha River, which were designated by number for convenience, grounding #1 being testified to as having occurred about the middle of December, 1935, below lock #10, later corrected to lock #8. Grounding #2 was testified to as having occurred about seven or eight days later, below Lock #10. Grounding #3 was testified to as having occurred below lock #10 in January, 1936. Grounding #4 was testified to as having occurred below lock #11 in April, 1936. Grounding #5 was testified to as having occurred below lock #11 in May, 1936. Grounding #6 was claimed to have occurred around July 1, 1936, below lock #10. We asked the witness to produce or supply us with the exact dates of those six alleged groundings, the number of barges included in the tow, the draft to which they were loaded, and the exact location of the alleged groundings, and I now call upon Government counsel to supply that for those six alleged groundings or else move the testimony as regards those be stricken from the record.

By Mr. GATCHELL. Of course, your honor, in the direct testimony of Captain Elsey no request was made upon him for the furnishing of any record in substantiation of his statement he had six groundings on some dates within the past year. That request was made by counsel for the defendant, and on cross examination Captain Elsey supplied dates as nearly as he could recall. We attempted to secure through Captain Elsey the original log books from the company for which he worked, the Raymond City Coal and Transportation Company, and the Huntington District Engineer office as well, and we were unable to get the original log books. He has not supplied them and apparently cannot obtain them. They will not let those log books go out of the Raymond City Coal and Transportation boats——

By Mr. JACKSON. Boats?

By Mr. GATCHELL. I mean out of their office. We have received a letter from Captain Elsey dated August 18, 1936, addressed to Lt. Col. John F. Conklin, and if the defendant cares to have me do so I will read that, or else just offer it without reading it, supplying the dates as nearly corresponding as he could with the dates mentioned in his testimony. He gives a number of dates.

By Mr. JACKSON. Before you read them may I say——

By the COURT. Have you seen the letter?

By Mr. JACKSON. Yes, sir; and the situation is this. He purports to give one record of a grounding in December, 1935. While it is a good many days off from his grounding #1, I would raise no question about that, because a matter of approximation. He then shows no possible date for grounding that could possibly relate to his alleged groundings 2, 3 and 4, which occurred, according to him, at the very end of December, January, and one in April. The groundings he shows after the alleged grounding of April is one of May 20, 1936. His grounding #5 was alleged to have occurred in May, 1936, so if there is any data to support it, it must pre-empt that. He has a record for June 28, or at least he says he has, and sends the data he says was taken, that would roughly correspond to his July 1, 1936. Although he could produce nothing corresponding to 2, 3 and 4, he undertakes to list eight other additional groundings, which the Government wants to put in evidence without subjecting him to cross examination, and it is our position we are entitled to any data available for those six groundings, and if none, we are entitled to the statement there are none, so where there is any data we may show the condition of the river, and the Government has no right to inject into this record evidence of alleged groundings at other times without producing any witness and submitting him to cross examination, merely because they have failed to supply data that their witness was asked to supply and which he said he could supply in substantiation of his six alleged groundings.

By the COURT. The data in that letter is to be received as to so many of those incidents, these groundings as you refer to them, as can be identified with ones to which the witness testified on the stand. In other words, the situation will be he testified to a certain number of these incidents while he was a witness on the stand, and was asked to furnish more detailed information as to the dates, location, draft of the barges, which were grounded, and as to the nature and extent of the load, and he has furnished it as to three of those.

By Mr. JACKSON. Then as to grounding #1 the closest approximation to that, the data furnished by the witness Elsey, is as follows:

Date, December 28, 1935. Hour, 8:00 A. M. Number of barges, four. Draft six feet. Exact grounding, ice gorge.

As to grounding #5, the witness Elsey has furnished the following information:

Date, May 20, 1936. Hour, 11:10 A. M. Number of barges, eight. Draft, 6½ feet. Exact grounding, Lock #10.

As to grounding #6, the witness Elsey has furnished the following information:

Date, June 28, 1936. Hour 8:55 A. M. Number of barges, eight. Draft, 6.5 feet. Exact grounding, Lock #11, with notation "double trip."

By Mr. GATCHELL. And of course your Honor the note appearing at the bottom of this should also be in the record, although the whole letter is of course to be received by your Honor. That note reads as follows:

"NOTE. December 1935 not noted on Manifest.

"Seven days later not recorded.

"Stages below Marmet not noted on Manifest.

"Record can be had Marmet dam and Point Pleasant, West Virginia."

Now in that connection he said that he had recalled an instance in which there had been a rise in the stage on the Kanawha River of about three feet over night. We requested him to supply the date this occurred at the request of counsel for defendant. He has not done so, but we have been informed by the Huntington office on May 18th there was a rise on the lower gage at Marmet of 2.6 feet, between 7:00 P. M., and 10:00 A. M., on May 25, 1936, there was a rise in stage of 2.1 feet between 8:00 P. M., and 10:00 A. M. on the same gage, and on May 26, 1936, there was a rise in stage of 2.4 feet between 4:00 A. M. and 10:00 A. M.

By Mr. JACKSON. We object to that because there is nothing produced by the witness Elsey in support of his statement.

By the COURT. That information you have is from another source, has nothing to do with Elsey's testimony?

By Mr. GATCHELL. Capt. Elsey testified that he recalled the rise of three feet over night and counsel for defendent requested him to supply the data on which that occurred and, if he could not get it, to secure it from some source.

By Mr. JACKSON. I didn't request him to do that. I requested him to supply it.

By Mr. GATCHELL. Counsel for defendant requested him to supply it, and they have asked me to secure that data from Capt. Elsey if I could do so and if I couldn't do so to call the Huntington office, that it had been supplied by the Huntington office.

By Mr. JACKSON. What Huntington office are you referring to?

By Mr. GATCHELL. The District Engineer's office.

By Mr. JACKSON. I object to the acceptance of that statement.

By the COURT. Does it relate to this particular incident that the witness Elsey testified about?

By Mr. JACKSON. He testified about having observed a rise of three feet. I asked him to supply the date. He has not done so. Counsel comes in and reads three dates. I don't know whether he thought he would testify to three dates or not, and he says it is from information he has collected from the Huntington Engineer office. If the Huntington engineer office wants to produce testimony, we will be glad to have them here.

By Mr. GATCHELL. Here is the colloquy, Your Honor, page 3075 of the record:

"Q. And you made a statement that you saw three feet difference below the Marmet dam, didn't you?

"A. I didn't say that I saw it.

"Q. What did you say?

"A. I said I received the Government reports of the river being from three feet and then showing a gage of three inches to four inches at the mouth.

"Q. You mean you received a Government report that showed that the gage was three feet different from what?

"A. Three feet higher than it was the day before at the time that I had received my marks from the previous day.

"Q. And will you give the date of that?

"A. I haven't got the date of that; no, sir.

"Q. Will your records show it?

"A. Yes, sir; the United States Government records will show that.

"Q. Do you have the record?

"A. I don't have that record unless I can get the proper date.

"Q. Will you find it the same way you found it before and send us the date?

"A. Yes, sir; I will try to locate it."

By Mr. Jackson. He hasn't done so.

By the Court. Now you come in here with—what is it, Mr. Gatchell?

By Mr. Gatchell. I come in here with the record supplied by the Huntington office.

By the Court. There is nothing to indicate that it relates to the time or the incident of which that witness spoke?

By Mr. Gatchell. He didn't relate any time, Your Honor. That is the difficulty.

By Mr. Jackson. We ask him to do that.

By Mr. Gatchell. He said he would get it.

By Mr. Jackson. But he didn't.

By the Court. The objection to the introduction of that is sustained.

By Mr. Gatchell. Will Your Honor grant us an exception, please? Do I understand the letter from Capt. Elsey and the list attached is received by Your Honor?

By the Court. As to those particular incidents, as to which he testified.

By Mr. Gatchell. Will Your Honor grant us an exception to the receipt for that purpose?

By the Court. Yes.

2718. By the Court. I think perhaps he had better show the source.

By Mr. Jackson:

Q. Will you state the source of the information that you have about the condition of the river and the operations of the Marmet Power Station?

A. The primary sources as to the elevations of pool levels at the foot of the Marmet dam, that is, at the head of the No. 6 pool, are the lock readings for the downstream gages at the Marmet dam.

By Mr. Thompson:

Q. Have you those lock readings here?

A. The source of the information as to peak carrying operations is my interpretation of those downstream lock gage readings as representing variable operation, which interpretation on my part is based upon my knowledge of the operation of the Marmet plant and the fluctuations which result from it in its tail-water, that is, in the pool level at the head of the No. 6 pool. The Marmet power station, under present conditions, causes fluctuations which, assuming at the beginning a pool level in No. 6 at the normal elevation or nominal elevation of that pool, extend to approximately three feet above that pool level. That is a normal, a necessary, condition resulting from the natural conditions in the river and the discharge capacity of the Marmet power station.

By Mr. **Thompson**. At this time I move to strike all of that testimony as the witness has said he ha based it upon readings of certain gages, I presume, and we haven't those gagings before us.

By the **Court**. I don't know whether he has them or not.

By Mr. **Thompson**. I have asked him to produce them.

By Mr. **Thompson**:

Q. Are they here?

A. There are here records which were taken from the Lock Master's Office and which were taken in that form and 2719 relied upon by me, under the understanding between counsel, as I understood it, that records of that kind could be used without producing the originals and subject to the check of either party to this controversy from the original data.

By Mr. **Jackson**:

Q. Will you please describe the condition of the river and the operations of the Marmet power station for the date apparently given by the witness Elsey for grounding No. 5, that is, May 20, 1936, at 11:10 a. m.?

A. I have not investigated downstream gage readings beyond those at the head of the No. 6 pool. I have been concerned with what appeared to me to be the obviously pertinent matter, 2720 namely, the question as to whether No. 6 pool, at the head thereof, had an elevation above the normal pool elevation for a sufficiently long period in advance of the stated time of grounding, such that no inadequacy of water supply at Marmet could have been the cause of inadequate pool levels downstream. That involves the time of lag, that is the time of travel of water from the foot of the Marmet dam to the respective points of grounding. I do not know exactly the time of travel. It would require a refined investigation. In my judgment it is within eight to sixteen hours, with regard to locks 10 and 11, and less for locks closer to Marmet dam. I have taken into account the water elevations at the foot of the Marmet dam for a period of at least 24 hours, in each case, so as to cover sufficiently the total period.

A. The stated draft of the barges is six inches greater than the project depth. There had been some peak carrying operations at the Marmet power station prior——

A. (Continuing.) To the time of the grounding, but there had been no variable load of any material extent for more than 24 hours prior to the time of the grounding and within that period of 24 hours prior to the time of the grounding—my statement is incorrect, in part. I should like to re-state beginning with that portion of my statement concerning peak carrying operations at the Marmet plant. Within 24 hours prior to the time of the grounding there had been peak carrying operations at the Marmet station. Within that same 24 hours the minimum excess of water level at the downstream lock gauge at Marmet, that is, at the up-stream end of the No. 6 pool, over and above the nominal pool level, had not been less than about 9/10 of a foot.

By Mr. Jackson:

Q. The level of the No. 6 pool at the upper end was 9/10 of a foot above the normal level?

A. A minimum of about 9/10 of a foot above the normal level.

Q. What would be the relation between the maintenance of that level in pool No. 6, and the levels of the pools downstream?

2721 A. There could have, in my opinion, been no inadequate water level below the normal pool level, that is, below the project levels at any of the downstream pools, due to conditions at the foot of the Marmet dam, or due to the operation of the Marmet power station.

Q. Colonel, witness Elsey, in connection with an alleged grounding No. 6, has furnished information to the effect that this grounding occurred June 28th, 1936, at 8:55 a. m., with a tow of eight barges loaded to a draft of 6½ feet, and at Lock No. 11, with the notation "double trip." Have you studied the conditions of the river and the operations of the Marmet power station at the time given by the witness Elsey for the sixth grounding, that is, June 28, 1936, at 8:55 a. m.?

By Mr. Jackson:

Q. Is the source of your study the same as you stated in connection with Grounding No. 5?

A. The sources are the same as I have stated in respect of the two groundings concerning which I have given the results of my investigation.

Q. Please describe the condition of the river and the operations of the Marmet power station at the time given by the Witness Elsey for his alleged Grounding No. 6, that is June 28, 1936?

A. That grounding, am I to understand, is stated to have occurred at 8:55 in the morning?

Q. Yes.

A. In the case of the June 28th reported grounding at 8:55 a. m., he barges are reported to have been loaded in excess of the project lepth by six-inches. For more than 24 hours prior to that grounding there had been no peak carrying operation at the Marmet power station and the water level at the head of Pool No. 6, had not been below an elevation of approximately 8 inches bove the normal pool level.

Recross examination by Mr. **Thompson**:

Q. Upon what data did you base these statements that you nade?

A. The data which I have previously stated, namely, the downstream lock gage readings at the Marmet locks.

Q. Have you those downstream lock gage readings with you?

2722 A. Not in their original form. I have them charted.

Q. In what kind of form have you them?

A. I have them charted in a form taken from the originals.

Q. And did you make up that chart?

A. I did not.

Q. So that somebody else made it up for you, did they?

A. That is correct.

Q. And you assume that they made it correctly?

A. That is true.

Q. Have you got those charts which they made up?

A. I have.

Q. You have them?

A. I have them.

Q. How long have you had them?

A. I do not recall. I did not have them in my possession for this particular purpose.

Q. Have you had them a month?

A. I had the gage readings at these locks prepared as a routine matter and kept up to date since practically the plants have been in operation.

Q. Have you had them a month?

A. Not in their present form.

Q. In any form?

A. I probably have.

Q. And who got them up for you?

A. They were prepared by H. E. McCormick.

Q. And where is Mr. McCormick?

A. His headquarters are at Charleston, W. Va.

Q. Is he there now?

A. I do not know.

Q. Is he employed by the Appalachian Electric Power Company?

A. He is.

Q. Will you produce them now?

2723 A. Produce them or him?

Q. Produce these records which he got up for you?

A. Yes.

Q. All right, produce them.

By the COURT:

Q. Col. Scheidenhelm, have you any records of the stream flow at Kanawha Falls for these dates or for, we will say, 48 hours ahead of the dates that have been mentioned as the dates of these groundings?

A. I believe I have, sir. They may be approximate.

By Mr. THOMPSON:

Q. Did you use the gagings at Kanawha Falls in this consideration?

A. I am trying to answer the question of the Court, if you don't mind. I cannot lay my hands at the moment upon discharge estimates at Kanawha Falls.

By the COURT:

Q. For any other gaging station up-stream?

A. I have corresponding estimates of flow at Marmet, at the dam.

By Mr. JACKSON. It was our thought that if the flow through Marmet was adequate, any conditions down-stream would be regulated by that. It wouldn't matter what was above because that is the controlling flow.

By Mr. THOMPSON. I object to the argument of counsel and ask that it be stricken out.

By the COURT. That is probably correct, but I wanted to know the information from any of the gaging stations, both Marmet and London. I will go ahead and hear what Col. Scheidenhelm has to say.

A. I will furnish the other as soon as I can get it, but, in the meantime, at Marmet in connection with the grounding stated to have taken place December 28, 1935, the flow past Marmet was in the neighborhood of 4,200 second-feet.

By Mr. THOMPSON:

Q. Was that continuously?

A. In the case of the grounding stated to have taken place May 20, 1936, the flow past Marmet dam was in the neighborhood of 3,000 to 4,000 second-feet naturally, but the peaking operation there may have cut the flow by in the neighborhood of 2,000 second-feet. The fact that there was a water level above the #6 pool level shows that there was flow past the Marmet dam. In the case of the grounding stated to have occurred on the morning of June 28th, the flow at Marmet was in the neighborhood of 2,500 second-feet.

2724 A. I have available here the gage heights at Kanawha Falls but the conversion of those gage heights into stream flow on the basis of the rating tables of the United States Geological Survey for that station I do not have at hand and it is not a simple matter because of the fact that it is a recording gage and it reveals the fluctuations from hour to hour or even minute to minute of flow at that station.

(Exhibit 603, being cover page and page 267 of document entitled "The Ohio River,—charts, drawings and description of features affecting navigation, War Department rules and regulations for the river and its tributaries; navigable depths and tables of distances for tributaries. (Compiled under direction of the Chief of Engineers, United States Army, and the District Engineer, Cincinnati, Ohio)," was offered in evidence.)

(Exhibits 586, 588, 589 and 590, re-offered for purpose of showing the position and action taken by defendant and as evidence of the position and intent of the defendant.)

(Exhibit 507, being Gage Recorder Sheet of Kanawha River at Kanawha Falls, West Virginia, for the period July 6-13, 1936 was offered in evidence.)

(Exhibit 506, being "Seventh Annual Report of the Federal Power Commission" 1927 was offered in evidence.)

(Exhibit 557, being pages 140, 141 of Journal of the Virginia House of Delegates for 1817-1818 was offered in evidence.)

F. W. SCHEIDENHELM (recalled)

By the COURT. I want to know the low water time in the river.

By the WITNESS. On December 28th and for the preceding forty hours, at Kanawha Falls gage, the minimum flow was 3,900 second-feet; the maximum flow on December 28th, was approximately 4,600 second-feet. On May 20th, and for the preceding 40 hours, the minimum flow at Kanawha Falls was approximately 6,250 second-feet, and the maximum flow on May 20th was 12,000 second-feet approximately. On June 28th and for the preceding 40 hours, the minimum flow at Kanawha Falls was 2,360 second-feet, and the maximum flow on June 28th at Kanawha Falls was approximately 2,800 second-feet.

By Mr. JACKSON:

Q. Is that 40 hours preceding the grounding in each instance?

A. It was preceding the grounding.

JOHN E. CARPENTER

Direct examination by Mr. THOMPSON:

Q. Mr. Carpenter, where do you reside?

A. Point Pleasant, West Virginia.

Q. What is your occupation?

A. Associate Superintendent of locks and dams on the Kanawha River, part of the Ohio and Big Sandy River.

Q. You are a part of the force of the United States Government, are you?

A. That is right.

Q. To whom do you report?

A. I report to Mr. Castle, the Chief of Operations.

Q. Of what?

A. Of anything that happens.

By the COURT:

Q. Do you have any subordinates working under you?

A. Yes, sir.

By the COURT:

Q. When they are more than five feet away, how do you communicate with them; ever have occasion to shout at them, or make yourself heard?

A. Sometimes, yes, sir.

By the COURT:

Q. What is Mr. Castle's title?

A. Chief of Operations.

Q. Of what?

A. Of the locks and dams in the Huntington Engineer Office District.

Q. Is he a member of the force of the United States District Engineer office?

A. He is.

2726 Q. How long have you held your present position?

A. Since 1932.

Q. Prior to 1932, what did you do?

A. I was in charge part of the time of all of the operation, and part of the time on some construction work of locks and dams.

Q. These locks and dams you speak of, you are referring always to locks and dams of the United States, are you?

A. Yes, sir.

Q. How long have you been on the Kanawha River, how many years?

A. I was on the Kanawha River from 1905 to 1911, then later ack in 1932.

Q. Who have you been working for since 1905?

A. U. S. Government, Engineer Department.

Q. What are you specific duties?

A. Operation and care of the dams, that is, maintenance and epairs and to keep normal project depths.

Q. A witness here by the name of Putnam testified that the rate f increase in flow in the Marmet pool and the Winfield pool, vould have no effect upon navigation until a discharge reached point which he termed obstructive; also that the rate of decrease n flow in those pools was immaterial, so long as the pools were not rawn down below normal project elevation, allowing for lockage, eakage and evaporation. In that connection, have you investiated the causes of any navigation difficulties on the Kanawha iver?

A. Yes, sir.

Q. In what respect do you investigate these matters?

A. When boats go aground, any fluctuation whatsoever that vould cause navigation any trouble, such as boats being grounded n chutes, in their landings, or in any way that would cause rouble.

Q. How do you know these boats are aground?

A. By going to them.

Q. Who lets you know?

727 A. Either the lock masters or the companies themselves, the owners.

Q. How do they communicate with you?

A. By telephone.

Q. And what do you do after you get the communication by elephone?

A. Immediately go to the place of trouble.

Q. Have you had any complaints from pool #8?

A. Yes, sir.

By Mr. Jackson:

Q. When? What were the character of these complaints?

A. That in the landing of the——

Q. Won't you speak a little louder?

A. In the landing of the Raymond City Transportation Comany, I have had complaints from them, on account of the water eing down, that is, fluctuation of it.

Q. Is that in pool #8?

A. Yes, sir.

Q. Did you investigate that?

A. Yes, sir.

Q. What was the cause for your investigation?

A. The fluctuations of the pool.

Q. The fluctuations of the pool?

A. Yes, sir.

Q. How do you know that?

A. By being there at the time and knowing what the pools were doing.

Q. Was the Marmet power plant operating at that time?

A. Yes, sir.

Q. Did you or did you not determine the cause of that fluctuation you speak of?

A. That is what I thought it was, from the power plant.

Q. From the power plant?

A. Yes, sir.

Q. Did you go to the power plant?

A. I did not.

Q. Do you have any reports on their operations?

A. Yes; twice daily.

Q. Did you at that time?

A. Yes, sir.

Q. What did that report show, if anything?

A. That they were pulling their pools down and after a shut off of the turbines it made a cut in the river which continued on out.

Q. State, generally speaking, the number of complaints you have had from pool #8?

A. Well, I would say we would have as many as eight or ten a month from that one point.

Q. How about pool #7?

A. About the same.

Q. And when you got these complaints did you go to them, and what was your job when you got there?

A. If the boats were grounded, get water from some of the other pools, if no vessels moving in any of the other pools we would take water out of the pools above and bring it down into the pool where the boats were grounded and float the boats.

By Mr. **Thompson**:

Q. Can your Honor hear the witness?

By the **Court**:

A. By straining I can.

By Mr. **Thompson**:

Q. Can't you throw your voice a little stronger? Have you ever borrowed any water from #6 pool to help out on these other pools?

A. Yes, sir.

Q. And when you do that, what is necessary, if anything?

A. Notify all interests in #6 pool that we intend to take from
$\frac{3}{10}$ to $\frac{4}{10}$ feet of water out. If any traffic moving we do not do
that, but notify all landings and all boats moving that are
2729 in the pool that can tie up or not be stranded—we notify
everybody in the pool.

Q. Why do you notify them?

A. To keep them from grounding their boats in their landings or while under-way.

Q. If you take $\frac{3}{10}$ of a foot from the #6 pool and give it to #8, will that cause groundings?

A. Yes, sir.

Q. Is that when boats are tied up?

A. Yes, sir.

Q. As well as moving?

A. Yes, sir.

Q. Have you made any investigation in pool #6 because of complaints?

A. Yes, sir.

Q. Approximately, how many have you made there?

A. You mean altogether or any particular time?

Q. Altogether, since the Marmet was completed?

A. I would say fifty or more.

Q. And you were personally on the ground?

A. Yes, sir.

Q. And went to them?

A. Yes, sir.

Q. And you helped them to get off?

A. Yes, sir.

Q. How did you help them get off on #6?

A. Well, we would either get a little bit of water from the London pool or we would build up #6 pool to a danger point.

Q. When you found these groundings, did you consult your daily report for the Marmet and London stations?

A. I always knew it, knowing this would happen, what it would
be. Of course, I would know all the gages at the time,
2730 know the amount of water in the river, and what they were
doing above and below, everywhere from Hinton down. We
know how much water there is from Hinton to anywhere in the
river.

Q. How much do operators on the Kanawha River allow for tying up or sparing out?

A. They try for a foot.

Q. A foot of what?

A. Water, under their boats, quite a few places they can't get that.

Q. Do you know of any groundings in the Kanawha River in time of low water during the past year—in the Marmet pool?

A. Yes, sir.

Q. Have you attended investigations there?

A. Yes, sir.

Q. What have been the conditions?

A. Well, at the stage of normal pool at the dam, at a lot of their landings it is just what shows on the gage, that is, no more in their landing than what shows on the gage, at normal pool.

Q. I don't believe I understand that.

A. At the head of the pools—on the landings it is not a nine foot stage you understand. Well, any fluctuation, $\frac{3}{10}$ or $\frac{4}{10}$ gets them in trouble at some of their landings, not all, but the majority, they have barely enough to load their barges out.

Q. You said a reduction of $\frac{3}{10}$ or $\frac{4}{10}$ in the Marmet pool causes groundings at some of the landings?

A. Yes, sir.

Q. Was that $\frac{3}{10}$ or $\frac{4}{10}$ of a foot?

A. Yes, sir.

Q. Supposing there is a fog over the Marmet pool, what do the boats do, if you know?

A. Tie up immediately, if they can.

2731 Q. And where do they tie up?

A. Any place they can get to shore.

Q. And if there is a fall of the water of $\frac{5}{10}$ of a foot, what, if anything, happens?

A. A lot of places they go aground.

Q. Would they go aground if it was $\frac{3}{10}$ of a foot?

A. Some places; yes, sir. It all depends where they are caught in the fog.

Q. What is the condition of pool #6 with respect to groundings, that is, what drop in the normal elevation of that pool will cause groundings?

A. $\frac{5}{10}$ of a foot.

Q. Have you had groundings at $\frac{5}{10}$ of a foot?

A. Yes, sir.

Q. Where?

A. The harbor at Charleston and the harbor at Elk River and the coal companies.

Q. What do you mean by coal companies?

A. At their landings.

2732 Q. How many tipples of coal companies are there [interrupted].

By Mr. Jackson. I object to all this testimony and move to strike it out. I don't know what testimony they are rebutting.

By the Court. What do you say as to that Mr. Thompson?

By Mr. Thompson. Mr. Scheidenhelm has testified and I think Mr. Thomas or Mr. Putnam rather, that on a certain drop there would be no danger of interference with navigation in these various pools we are now discussing. I will read to your Honor from page 5274 the testimony of Rufus W. Putnam:

"Q. Major Putnam, in your opinion what, if any, adverse effect on navigation would result from an increase in stage at the head of the Marmet pool, at a rate not exceeding 1½ ft. per hour?"

"A. There would be no adverse effect upon navigation if the rate of increase in stage did not exceed 1½ ft. per hour up to a point where a critical discharge of 22,000 second-feet or more obtained, at which point it is possible current velocities would be such as to begin to interfere with navigation."

By the Court. That is on the increase.

By Mr. Thompson. Yes, sir. Now on page 5277: "Q. Major Putnam, in your opinion, what if any, effect upon navigation in the Marmet pool would result from a decrease in stage at the head of the Marmet pool for not more than two hours at a rate not exceeding 1½ ft. per hour, or from a decrease in discharge at the head of the Marmet pool for not more than two hours, at a rate not exceeding 6,000 second-feet per hour?"

"A. The rate of change in stage would have no effect on navigation, adverse or otherwise, except the necessary adjustments to lines and spars where boats are tied up at the terminals, so long as this rate did not continue to a point where the
2733 pool was no longer maintained at its project level."

He is testifying as to the effect in these pools with only a drawdown of ⁵⁄₁₀ of a foot, going away down below.

By the Court. Below the project level, I presume?

By Mr. Thompson. He has not said that.

By the Court. You don't expect me to believe this witness when he says no matter how deep the water is in the London pool and it goes down ½ foot it will ground boats when (interrupted).

By Mr. Thompson. We are not speaking about the London pool. We are speaking about the Marmet pool and #6.

By the Court. What is project level?

By the Witness. Eighteen feet at the dam.

Q. And what is it at the upper end of the pool?

A. Nine feet.

By the Court. If you keep it eighteen feet at the dam, no less than that, do you have any groundings?

By the Witness. Yes, sir, at their landings.

By the Court. It seems to me you have a situation that can't be helped, you have not got enough depth in your pool.

By Mr. THOMPSON. It is due to fluctuation.

2734 By Mr. JACKSON. The fact is landings and harbors are no part of a Government project. Private individuals make their own landings and sometimes they try to save too much money, but that hasn't anything to do with Federal navigation or this suit.

By the COURT. Do you mean to say it is the duty of the lock masters there to keep that water eighteen feet deep at the Marmet dam?

By the WITNESS. Yes, sir.

By the COURT. Even when he does that he has groundings at some of the landings?

By the WITNESS. In fluctuations at eighteen feet he wouldn't have.

By the COURT. You said he would have a minute ago.

By the WITNESS. If he had eighteen feet he would have a nine foot project in the channel—any fluctuation from that will decrease the channel depth. In the landing, you understand what that is, there isn't nine feet always, and consequently any fluctuation of ½ foot will cause trouble in the harbor.

By the COURT. You mean a decrease?

By the WITNESS. Yes, sir.

By the COURT. Now the witness you quoted, whom you say you are seeking to rebut, makes it a condition the water shall not be lowered below the project level, doesn't he?

By Mr. THOMPSON. He says the rate of decrease will not affect navigation.

2735 By the COURT. Provided the water does not fall below the project level?

By Mr. THOMPSON. "The rate of decrease in stage at the head of the Marmet pool for not more than two hours at a rate not exceeding 6,000 second-feet per hour." The answer was: "The rate of change in stage would have no effect on navigation, adverse or otherwise, except the necessary adjustments to lines and spars at the terminals so long as this rate did not continue to a point where the pool was no longer maintained at its project level."

Are people going to have to elevate and change their spars all because of this power operation?

By the COURT. That is not what you are asking. You were asking about grounding vessels. You say his testimony is in contradiction of the witness you quoted.

By Mr. THOMPSON. I certainly do.

By the COURT. I have not been able to see it.

2736 Q. Is it possible to have a rate of change of 1½ feet per hour in the Marmet pool without affecting navigation?

By Mr. Jackson. A rate of change of what?

By Mr. Thompson. A rate of change of 1½ feet per hour without affecting navigation.

By Mr. Jackson. I object to the competency of the witness to answer that.

By the Court. He may answer.

A. Yes, sir.

Q. What would happen?

A. Well, at that rate all kinds of boats would go aground.

By the Court. Just a minute—there is one condition—that you should not go below the project level.

Q. Can you keep from going below the project level if you have a flow of 1½ feet per hour of fluctuation?

By Mr. Jackson. I object to the question because not intelligible. You mean an increase or what?

By Mr. Thompson. An increase. I am asking the question you asked.

By Mr. Jackson. I should think you would keep them from grounding unless you were loading very rapidly.

Q. Does the rate of change have any effect on navigation in the pool?

A. Yes, sir.

Q. Does the rate of change in stage have any effect on navigation in the Marmet pool?

A. Yes, sir.

Q. In what way does it have?

A. You could not navigate with a river rising one foot an hour.

Q. What would be the effect say with the river dropping 1½ feet per hour?

By the Court. I would like to have the reason for that.

A. The current would be too strong in any river rising one foot an hour. The boat could not handle the tows.

By the Court:

Q. Do you mean even when the water wasn't going over the top of the dam?

A. A river rising one foot an hour, ~~the dam~~ would be lowered, that is, the wicket dams so far as that would go, and the roller type dams would be raised. A river rising one foot an hour is very, very dangerous to navigation, or to the structures, that is, the dam.

Q. Have you ever known the river to rise in normal times in the Marmet pool at the rate of one foot per hour?

A. You mean with low water or high water?

2737 Q. High Water.

A. Yes, sir.

Q. How about low water?

A. I don't remember of it being one foot an hour in low water.

Q. What do you have to do when it starts to rise at that rate?

A. Immediately raise rollers, and lower the chanoine dams, put them all down.

Q. How close to the elevation do you keep the water in the pool at the Marmet dam?

A. About $\frac{1}{10}$ of normal, that is, the dam at eighteen feet stage.

Q. $\frac{1}{10}$ of a foot?

A. Yes, sir.

Q. And supposing it gets more than $\frac{1}{10}$ of a foot below, what do you do?

A. We operate the dam to bring it to that point.

Q. Are you under orders to do that?

A. Yes, sir.

Q. And if it goes above $\frac{1}{10}$, what do you do?

A. We operate the dam to control it.

Q. At what rate does the river flow up where it comes into the London pool, what speed does it have, what velocity would you say, approximately?

A. Oh, in open river I would say it would be probably three to four miles an hour.

Q. Assume a wave five inches in elevation, flowing with a river that is going 3 miles an hour, would you, from the banks be able to observe that?

A. Yes, sir.

Q. If it rose five inches in three hours, would you be able to observe it?

A. Yes, sir.

2738 Q. How about it if you were on a boat, could you observe it?

A. You could observe it there quicker than if you were on the shore.

By Mr. Thompson:

Q. What effect, if any, would that wave coming into the London Pool at the upper end, on a flow of 3 miles per hour, and the wave $\frac{7}{10}$ of a foot high, have on navigation?

By Mr. Jackson. I object to the competency of the witness to answer that.

By the Court. Navigation where?

By Mr. Thompson. Within the London pool.

By the Court. I will let him answer it.

By Mr. Jackson. He has proven no qualifications, I submit, and I except.

A. It would cause a readjustment of landing places that were tied up in the landing and it would cause trouble to boats with tows operating either way, either up or down the river.

Q. And what would that be due to?

A. Current.

Q. What is the most serious problem with respect to stream flow that boats have up and down that river?

A. The fluctuation of it and current.

Q. And what do those fluctuations cause, if anything?

A. If they are serious enough, they cause boats to go ashore that are under way and those that are tied up—continual care must be taken of them.

Q. I ask you to assume this same wave passing on down from the London to the Marmet pool, what would be the situation in the Marmet pool with respect to being able to observe the wave from the shore?

By Mr. Jackson. I object to the competency of the witness to answer the question.

By the Court. He may answer it.

By Mr. Jackson. Exception.

A. It would be the same.

Q. Would you be able to see it?

A. Surely.

Q. Would you be able to see it if you were on the boat?

A. Certainly.

Q. And would a boatman on there realize that there was such a wave if he were going up against it?

A. Sure.

Q. If it passed on down from Marmet to No. 6, what would the condition be?

A. It would be the same thing.

2739 Q. Assume a wave such as I have described, passing on from the Marmet to No. 6, state whether or not that wave would pass on down beyond No. 6?

A. Yes, sir.

Q. And how far down would it go?

By Mr. Jackson. I object to the competency of this witness to testify to the behavior of waves. He hasn't shown the slightest qualification either in education or experience.

By the Court:

Q. How were you going to get these waves past the different dams?

A. Water goes on by them and you have to take care of it somewhere.

Q. Mr. Thompson asked you about a wave coming down $\frac{7}{10}$ of a foot high into the London pool and you told him what it would do and you say if that wave went on into the Marmet it would do the same thing and if it went on down below Marmet it would act the same way. How are you going to get it by these different dams?

A. You have got to pass that water. It don't make any difference where it goes to, and it creates the same thing, on and on.

Q. Suppose Marmet was drawn down, or London—which is the one of those dams that has a draw-down of 3 feet? Suppose that wave came into London dam when it was drawn down 3 feet. Would it go on through?

A. No, sir; not when it was down three feet.

By Mr. Thompson:

Q. But you are assuming the London dam is filled up?

A. I am talking about normal pool.

Q. And you are assuming it without a draw-down?

A. Yes, sir.

Q. How far down the river would that wave go?

By Mr. Jackson. I object again to the competency of the witness to answer the question.

By Mr. Thompson:

Q. Would it go to the Ohio?

By the Court. I will let him answer.

By Mr. Jackson. Let our exception be noted and I also suggest that while I haven't been objecting counsel ought not to make every question leading.

A. Water would go on out of the Kanawha River if everything is normal, that amount of water.

By Mr. Thompson:

Q. Assume the construction of the Winfield dam—have you studied the situation of that river from the Marmet to the Winfield dam?

A. Yes, sir.

2740 Q. What is the shape of the river?

A. Very tortuous.

Q. Is it wide or narrow?

A. It is about 500 feet wide over all.

Q. And, what is the channel width?

A. That will average about 100 feet. It is constricted at places to 60 or 80 feet.

By Mr. Thompson:

Q. State whether or not there are any waves coming from the Marmet dam that do affect navigation in Pool #6?

A. Yes, sir.

By Mr. Jackson. I object to that question. It is not a proper question, not proper rebuttal.

By the Court. I will let him answer it.

By Mr. Thompson:

Q. You say yes?

A. Yes, sir.

Q. What is the character of the channel from Marmet down to the Winfield dam site?

A. In quite a few places it is very narrow and the river is very crooked.

Q. Do you know a place called Elk Chute?

A. Yes, sir.

Q. Do you ever have any groundings on Elk Chute?

A. Yes, sir.

By Mr. Jackson. I object to the testimony about groundings as not proper rebuttal and move to strike it out.

By the Court. Objection overruled.

By Mr. Jackson. Many our exception be noted?

By Mr. Thompson:

Q. What were those groundings caused by?

By Mr. Jackson. If the Court is going to permit that, may I have a standing objection as to groundings as not proper rebuttal?

By the Court. Yes.

A. By the fluctuations of the pool.

By Mr. Thompson:

Q. From what fluctuations?

A. Most of them from the power dams—from the power waves.

Q. Will the depth of the pools that will be produced by the construction of the Winfield dam obviate those groundings that you speak of?

A. Quite a few of them; yes, sir.

By Mr. Thompson:

Q. What is it that causes the grounding of boats in the channel, generally speaking, if you know, in a narrow channel?

2741 A. By the fluctuation or the dropping of the water while
navigating them. When the water falls in these narrow
channels it restricts them. Even if you have the project depth
right in the channel, if boats handle these tows four or five hundred
feet long out in front of them, the boat itself uses the water
2742 on either side of the channel. Probably the boat will be
drawing 5 feet of water. It will get in position in this
shallower water to drive these tows through the channel.

Q. Why it is that the boat itself can't keep its tows in the channel?

A. When it is going around a bend they have got to flank.

Q. Got to what?

A. Flank.

Q. What do you mean by that?

A. Back their sterns into a position that the head of the tows will be in line with the channel, probably have to drive out of this point and flank to the opposite side while the tow boat itself wouldn't always be in the maintained channel. It will be on one or the other side of it.

Q. What compels it to do that, if you know?

A. Tortuous channel. The channel is crooked.

Q. Is the channel tortuous from Marmet down to Winfield?

A. Yes, sir.

Q. And will the current, or, if there is a discharge from the Marmet power plant after the Winfield project is finished, be eliminated from the waves from the Marmet?

By Mr. Jackson. I object to that question.

By the Court. He may answer it.

A. The current will not all be eliminated. It will be reduced, but not all of it.

By the Court:

Q. Mr. Carpenter, do you state that you undertake to keep the water in the pool at 18 feet at the dam?

A. Yes, sir.

Q. How far below the top of the dam is that?

A. That is right at the top of the dam, at the crest.

By Mr. Thompson:

Q. At the crest, you say?

A. Yes, 18 feet is the crest.

2743 Q. And do you try to keep it, as counsel here has described it so graphically, mathematically near that point?

A. Just under the top, so it won't roll over. We are not permitted to have water go over the roller type dam, over the top of it.

Q. And you have orders to that effect, do you not?

A. Yes, sir.

Q. State whether or not your orders are to hold it not less than one-tenth from the crest of the dam?

By Mr. Jackson:

Q. Are your orders in writing?

A. Yes, sir.

By Mr. Jackson. I object to the question as not the best evidence. If there are any orders in writing, the Government must have control of them.

By Mr. THOMPSON. A man can state, if he knows of his own knowledge. Certainly if he has orders, he doesn't have to bring a writing up here.

By the COURT. They may be in such language as to permit of some condition or exception or qualification. I will permit him to answer it, however.

By Mr. JACKSON. Exception noted.

By Mr. THOMPSON:

Q. What are your orders with respect to the height at which you shall keep this water in the reservoir at the Marmet pool?

Q. (The question was read as follows:) State whether or not your orders are to hold it not less than one-tenth from the crest of the dam?

A. Yes, sir.

Q. By that I mean one-tenth of a foot?

A. Yes.

Q. State whether or not that means that you are expected to hold it at one-tenth of a foot from the crest of the dam?

A. Yes, sir, we are.

Q. I think that you testified, did you not, that boats tried to allow for one foot when they are sparred out?

A. That is right.

Q. Are there any places along the channel, let us say in the Marmet pool, where there is less than one foot?

A. We have one.

Q. Where is that?

A. At Houston.

By Mr. JACKSON:

Q. You mean less than one-foot depth?

A. One-foot depth.

2744 By Mr. THOMPSON:

Q. What is the margin there, do you know?

A. Well, it is less than a foot. When that pool is down, when the storage is out of it, taken out of the pool, we have less than a foot—around a foot at the London pool.

Q. That is under the bottom of the boat?

A. Yes, when that pool is down.

Q. Were you informed at the time of these groundings that you speak of in the #6 pool as to the power plants operations occurring at the time of the groundings?

A. Yes, sir.

Q. How would that occur? Who, by the way, is the Lock Master at #6?

A. Mr. Bright.

Q. And if there is a grounding, does he call you?

A. Immediately.

By Mr. **Thompson**:

Q. What would be the effect on the wicket dams of a wave of 7/10 of a foot, passing on down the river?

By Mr. **Jackson**. I object to the competency of the witness to testify at all as to waves, and may our exception be allowed generally to that line of testimony.

By the **Court**. Yes.

A. The wickets would have to be operated to pass the flow of water on.

By Mr. **Thompson**:

Q. What do you mean, by raising the wickets or lowering them?

A. Lowering them down to give space for water to pass by, simply putting them down.

Q. Do you have any experience with waves going down that river where the wicket dams are?

A. Yes, sir.

Q. What experience have you had?

A. I have to be in charge of the operation of the dam, be out with them.

Q. Are you there when they raise and lower the wickets?

A. Not always.

Q. Frequently or infrequently.

2745 A. Well, I would say infrequently, unless something happens unusual. The Lock Master is competent to operate the wickets unless something unusual happens, and I don't have to go to them.

By Mr. **Thompson**:

Q. Based on your experience in operating locks and dams on the Kanawha and Ohio Rivers, what is your opinion as to whether or not power waves received into the London pool under the conditions under which the Marmet pool is now operated, would be transmitted through the Marmet, Winfield, and Gallipolis pools into the Ohio River?

By Mr. **Jackson**. I object to the competency of the witness to answer that.

By the **Court**. What power waves has he ever seen transmitted into the London pool?

By Mr. **Thompson**:

Q. Have you ever seen power waves coming from the London pool into the Marmet pool?

By the **Court**. I understood you to say coming into the London pool.

By Mr. Thompson:

Q. Based on your experience in operating locks and dams on the Kanawha and Ohio Rivers, what is your opinion as to whether or not power waves received into the Marmet pool under the condition under which the Marmet pool is now operated, would be transmitted through the Marmet, Winfield, and Gallipolis pools into the Ohio River?

By Mr. Jackson. I object to the competency of the witness to answer that question. It is a question that involves a higher degree of knowledge of hydraulics than this witness has.

By the Court. I think so, but if this witness thinks he has the knowledge, he can answer it. It is based on his experience and observation.

By Mr. Thompson. Here is a man that is doing nothing else but going up and down this river, called out practically day after day and many nights to test waves that are coming from the Marmet pool and yet counsel has the audacity to arise and object to his being an expert after they put on this gentleman that came from up near Pittsburgh.

By the Court. He may answer.

By Mr. Jackson. May our exception be noted?

A. My opinion is that the water would go on out into the Ohio River at about the same rate that it was received into the Marmet pool.

Q. Mr. Carpenter, assuming a total rise in stage in the Marmet pool of $^{8}/_{10}$ of a foot in five hours, with a similar decrease in stage, and this rise and fall occurring every 24 hours during the week, what would be the effect on navigation moving up-stream?

By Mr. Jackson. I object to the competency of the witness to answer that question.

By the Court. He may answer it.

A. At the peak of the rise, moving up-stream, it would be difficult for towboats to handle their tows.

By Mr. Thompson:

Q. What do you mean by "difficult"?

A. Currents driving them on shore from some of the chutes that they go through.

Q. And what would the situation be as to those moving downstream?

A. It would be practically the same thing.

Q. Assuming a total rise in stage below the Marmet pool of 1.2 feet in five hours with a similar decrease in stage, and this rise and fall occurring every 24 hours during the week, what would be the effect on navigation in pool #6 that was going up-stream?

A. It would be the same effect and besides it would have everybody crazy most of the time, keeping their stuff afloat, keeping their boats afloat in the landings.

2746 Q. Would that condition exist both going upstream and downstream?

A. And in the landing, yes.

Q. How often do these power waves go down the river, if you know, from the Marmet dam site?

A. Each time they operate their power plant.

Q. And what is the result among the shipping industry on the river?

By Mr. JACKSON. I object to that question as entirely too indefinite.

By Mr. THOMPSON:

Q. What is the effect, if you know?

By Mr. JACKSON. I object just the same as too indefinite.

By the COURT. He may answer.

By Mr. JACKSON. Exception noted.

A. It keeps them in a state of uncertainty as to the mooring of their vessels in the harbor and a navigator leaves one lock with the assumption that there will be no change in the river and he meets this and he is all bewildered. He simply doesn't know exactly what to do and it causes considerable trouble wherever he meets this wave.

2747 Cross examination by Mr. JACKSON:

Q. Mr. Carpenter, how old are you?

A. 58.

Q. You started working for the Government in 1905?

A. Yes, sir.

Q. And where did you work before that?

A. Before I started work for the Government?

A. Yes.

A. I worked in a timber camp at various places.

Q. As I understand it, up to the time you went with the Government you had been working in timber, lumbering, and things of that character?

A. And river work.

Q. Mr. Carpenter, will you define a wave for me.

A. As I see it, it is a sudden rise of water in pools that passes rapidly along the river.

Q. You say it is a sudden rise; is that right?

A. Yes.

Q. Will you tell me how great a rise and how sudden it is to constitute a wave in your definition?

A. Well, speaking on the river that I have had anything to do with, a wave from half a foot on up.

Q. You mean if you could see the face of water half a foot high or higher?

A. No, I don't mean that.

Q. What do you mean?

A. I mean a rise of that.

Q. And how sudden?

A. From one to five or six hours for half a foot.

2748 Q. That is, a rise of half a foot in one to five or six hours, is a wave, according to your definition?

A. Yes, sir; that is the way we look at it.

Q. Did you discuss waves with anyone before you came here to testify?

A. Before I ever knew there was a trial here, I did.

Q. With whom?

A. With employees and with my superiors.

Q. How long ago was that?

A. That was when we contemplated the operation of those—wondered what we would do, how the power plants would act at the Marmet and London pools.

Q. That was about the time that the power plant at the Government navigation dam was going to commence operation?

A. Before that.

Q. Just before that, and that was the first time you discussed waves with your superiors, wasn't it?

A. Yes.

Q. Did they tell you what the shape of a wave at that time was?

A. No; he had graphs he showed me.

Q. He showed you some graphs?

A. Yes.

Q. What graphs did they show you? Have you got them with you?

A. No; not any particular kind. We had them in the office and looked at them and they showed the effect.

Q. You have defined a wave in general. Tell me what would be the slope of the front of the wave that you have in mind?

A. I wouldn't know that.

Q. Have you any idea?

A. I would know where a certain body of water would start and know what to do with it from one dam to another.

Q. I am trying to find out how steep this wave is.

2749 A. I have no idea.

Q. Could you tell me whether it would be one degree or sixty degrees from the horizontal?

A. I couldn't tell you that.

Q. You don't know about that. Well, now, Mr. Carpenter, assuming that you were standing on the bank on the side of the London pool and there were a rise of five inches taking place gradually over a period of 5½ hours, is it your testimony that standing there on the bank you could observe the rising water?

A. Yes, sir.

Q. That is, you mean that as you stand there, you can look out and say, "I see the water rising"; is that right?

A. I would say "the river is rising."

Q. You could see that?

A. Yes.

Q. That would be a total rise of less than an inch in an hour, wouldn't it?

A. Five inches in five hours.

Q. Five inches in 5½ or 6 hours? It would be something less than an inch an hour?

A. That is right.

Q. And can you tell me how much of a rise that would be in one minute?

A. No; I wouldn't attempt to. I wouldn't know. I just would know that the river is rising.

Q. You can check me on the mathematics; I take it that if that water were rising at the rate of something less than an inch an hour, it would be rising at the rate of something less than 1/60 of an inch a minute, wouldn't it?

A. Well, assuming that it did.

Q. I just wanted to see how fine your eye is. It is your testimony that you can stand along the side of a river and you can observe with your naked eye a rise as small as something less than 1/60 of an inch a minute.

2750 A. Particularly when the river is rising.

Q. Answer my question directly. Can you observe a rise as small as that?

A. Yes, I can tell.

Q. You can tell?

A. I can tell.

Q. In the same way you can stand on the bank of a river and if the river is falling at a rate of less than 1/60 of an inch a minute, you can observe that, can you?

A. A falling river is harder to determine than a rising river.

Q. Now, let us see; do you think, standing on the bank of a river, you could observe with your naked eye a fall in the surface of the river at a rate of less than 1/60 of an inch a minute?

A. I could not on a falling river.

Q. Suppose instead of taking five or six hours to fall 5 inches, it took 18 or 20 hours, do you think that you could observe a falling in the river stage as you stood along the bank?

A. No, sir.

Q. Do you think that if you were on a boat you could observe the fall in the river stage declining at the rate of five inches over a period of 18 or 20 hours?

A. No, sir.

Q. You couldn't detect that in a row-boat, could you?

A. No, sir.

Q. I wanted to see whether you want to reconsider your testimony about a rise. In your opinion, would a rise in the stage of the river, proceeding at the rate of something less than 1/60 of an inch a minute, or less than one inch in an hour, have any effect on a boat?

2751 A. Sure, it would have an effect on the boat.

Q. Would it have a pretty substantial effect, in your opinion?

A. It all depends on where the boat was at the time.

Q. You are moving now on the surface of the stream?

A. That is right.

Q. Is it your testimony that a rise in stage at the rate of something less than 1/60 of an inch a minute or less than an inch in an hour, would have any substantial or appreciable effect upon the boat?

A. Yes, sir.

Q. That is your testimony?

A. Yes, sir.

Q. You are very clear about that?

A. Yes, sir.

Q. I want to show you a statement in defendant's exhibit 544 for identification, which is a document compiled in the Huntington Engineering Office, as to certain wave tests in 1930 which had an amplitude in excess of what I have stated to you, and I read to you from page 113 as follows: "The tests (referring to these waves)——"

By Mr. **Jackson**:

Q. Mr. Carpenter, I read to you from page 113 of this compilation of the Engineer Office at Huntington as follows: "The tests (referring to these 1930 wave tests) perhaps were important in demonstrating the absence of any marked changes in stream stages such as would affect transportation vessels as they were too slight to even affect a row boat," and ask you whether or not you agree with this conclusion that I have read to you from this document?

A. I can't agree to that.

Q. You didn't take any part in those wave tests in 1930, you?

A. No, sir.

Q. Did you know Major Herman?

A. Very well.

Q. Was he District Engineer in charge of the Hunting District in 1930 and some time thereafter?

A. I think so, yes.

Q. And if that conclusion that I have read to you were su scribed to by Major Herman, would that affect your judgmen

By Mr. Thompson. If the Court please, I object to that. isn't shown that this document ever was subscribed to by Maj Herman. This document is not in evidence. As I understa it, it was ruled out. He is asking him if it has been subscrib to and that it came from the Huntington office. I suggest th is misleading to the witness.

By the Court. I think the objection is well taken unless the is some showing that the opinions there expressed were tho of Major Herman.

By Mr. Jackson. I have nothing but the two letters of tran mittal.

By Mr. Jackson:

2752 Q. Mr. Carpenter, you have been testifying about cu rents in some of these future pools: What would be t velocity of current in the Gallipolis pool, when completed, with flow of 2,000 second feet?

A. Put that into "opening into the dam" and I could tell yo about that. I don't know anything about second feet to curren Put it into "opening into dam."

Q. Is current expressed in second feet?

A. Not in my language; I know it is, though.

Q. Well, you would not have any idea what velocity woul result from a flow of 2,000 or 3,000 or 4,000 second feet through th future Gallipolis pool?

A. No, sir; you would have to give me the opening in the dam- the way we get our currents. I don't go by miles or cubic feet o second feet.

Q. You testified about some waves passing down through Ma met, the future Winfield pool and the future Gallipolis pool an into the Ohio River. Let me ask you this question: Assumin a wave with a total amplitude or volume of 4,000 second feet enter ing the London pool and riding on a base flow of 2,000 second fee how much would that wave raise the Gallipolic pool by the tim it reached the Gallipolis dam?

A. We would not permit it to raise any.

Q. I did not ask you that.

A. I could not tell you that. However, we would not allow for our pools to raise above normal.

Q. I did not ask you that. I will ask that the question be read.

By Mr. THOMPSON. He is doing very nicely; let him answer your question. Let him proceed.

By Mr. JACKSON. Q. I will ask for the question to be read. [The question is read.]

By Mr. THOMPSON. I would like to suggest that this witness does not understand the term "amplitude." Counsel should state that in the English language.

By Mr. JACKSON. I told him what it was—volume; and he was offered as an expert. I did not think he was an expert, however.

By Mr. THOMPSON. He is an expert on the operation of the dam, but not on "amplitude."

By the COURT. That is the very line of examination that you conducted, Mr. Thompson. You asked him to define or as to the manner these waves passed from one dam into another. You may not have expressed it in second feet. You probably said waves of such a height in inches.

By Mr. THOMPSON. Yes, sir; in the simplest language. If you talk about "amplitude", you will have to throw the life-line out for him.

By the COURT. If he does not understand it, he may say so.

By Mr. JACKSON. The questions that you asked (addressing opposing counsel) were so general, I could answer them myself and would not have to cross-examine this witness. Please read the question. [The question is read.]

A. I could not tell you that.

Q. What is the area of the Gallipolis pool?

A. I don't know that either.

Q. How many acre-feet of water would it take to raise the Gallipolis pool one half inch?

2753 A. I don't know.

Q. What is the area of the Winfield pool?

A. I don't know.

Q. Can you tell me how much water it would take to raise the future Winfield pool—how many acre-feet or second feet—an inch?

A. No, sir.

Q. Assuming that the Marmet pool varied 0.3 of a foot, how much would it raise the surface of the future Winfield pool?

A. 0.3 of a foot?

Q. Yes, sir.

A. Probably 0.1 or 0.2.

Q. Why do you say that?

A. I never had experience with Winfield pool being in operation. It is not completed.

Q. Do you know how much volume of water would be involved for lowering the Marmet pool 0.3 of a foot?

A. In second feet, no, sir.

Q. Or in acre feet?

A. No, sir.

Q. Or in any other unit of measurement?

A. In tenths only; in tenths of a foot at a given point.

Q. How many tenths of a foot would it be?

A. Probably one or two.

Q. If you change it 0.3 of a foot at Marmet, would it be 0.1 or 0.2, say, in Winfield?

A. I could not say definitely.

Q. You do not have any idea how much volume of water it would take to effect a change of 0.1 or 0.2 or 0.3 of a foot in the Winfield pool?

A. It don't have any pool as yet.

Q. Or the future pool. You have testified about that, Mr. Carpenter?

2754 A. No, I could not tell you how much water 0.3 of a foot would make in Marmet pool or Winfield pool, for the simple reason that I have had no experience with Winfield.

Q. Can you tell me how much volume of water it would take to raise No. 6 pool, one inch?

A. Tell you how much it would take?

Q. Yes, sir, how much volume?

A. (No answer from witness.)

Q. You cannot tell how much volume of water it would take to raise any pool now in existence on the Kanawha River one inch, two inches, or three inches?

A. Expressed in second-feet?

Q. Acre-feet, gallons, or anything else?

A. No, not in acre-feet.

Q. I don't care whether it is acre-feet; it can be gallons or second-feet or any unit of measurement of volume that you know of. Can you?

A. No, sir; I cannot tell you.

Q. Can you tell me what velocity of flow would result in any pool on the Kanawha River, by reason of a flow of 1,000 or 2,000 second-feet?

A. You mean by current?

Q. Yes, sir.

A. Very little; it would be very little; I don't know exactly.

Q. And you do not know what change in velocity of flow would be produced by increasing the flow through the pools from a base flow of 2,000 second-feet to a base flow of 4,000 second-feet?

A. Not exactly.

Q. Can you tell me approximately how much it would increase it?

A. No, sir; I would not want to make that expression; no, sir.

Q. You said you never let water go over the dams, didn't you?

A. The roller type dam.

2755 Q. Would you do anything in case of a flood?

A. We take them out of the river.

Q. You let the water go over the crest of the dams at times, do you?

A. Not unless there is some accident.

Q. You are drawing the distinction between going over the roller gates and over the crest of the dam?

A. Yes, sir.

Q. And when there is a flood into the dam, it flows over the gate and not the crest of the dam?

A. No; the crest of the dam is the top of the gates—is the top of the roller.

Q. It is your testimony that when the roller gates are down, water never goes over the crest of the dam?

A. It should not; it seldom does; it might rush over.

Q. I am not talking about what it should do. Is it your testimony that it does or does not go over the roller gates?

A. It has gone over at times, but it is against all our regulations and orders to do that.

Q. Regardless of the regulations and orders, it is a fact that, from time to time, water does flow over the top of the roller gates?

A. Occasionally.

Q. To what depth?

A. I don't know what depth.

Q. Do you operate these dams or not?

A. Yes, sir.

Q. But you are not close enough in contact with them to know what depth the water flows over at times?

A. No, sir; it don't last but a few minutes, unless you are talking about the roller flap.

Q. No, sir. Tell me at what depth the water does at times flow over the roller gates, if you know, and if you don't know tell me so?

2756 A. We have one roller goes over five feet. It is a flap gate.

Q. I am not talking about that.

A. I don't know how deep it was the—over the top—the time the surge came over. We have had water over the roller a few times.

Q. And you don't know how many or how much?

A. No, sir; I could not tell you.

Q. How far down below the top of the gates has the Marmet pool been?

A. The roller has been out of the water, all of them.

Q. The rollers have been out?

A. The roller gates at the crest of the dam. It is a roller dam and in high water, or when you spill the water out, it is picked out of the water and the water goes under the gates.

By the COURT. He didn't ask that.

By Mr. JACKSON:

Q. When the roller gates are closed and the other gate is up, is it your testimony that the water at Marmet has never been below the crest of the gates?

A. Surely, it has been below, yes, sir.

Q. How much?

A. It is kept at 0.1 below nearly all the time, to keep from going over.

Q. What drop below the crest of the roller goes in the operation of Marmet?

A. About 0.1; we have a variation of about 0.1.

Q. Are you sure of that?

A. Yes, sir; quite sure.

Q. What would you do if it went over 0.1 below?

A. We would find out the cause of it, with the exception of making a test or something, or something like that.

By the COURT:

Q. Doesn't it vary more than that when there is lockage?

2757 A. No, sir; no, sir. We have a very close margin to operate on.

By Mr. JACKSON:

Q. Do you operate the London roller gates every time Marmet gets more than 0.1 below, or as much as 0.1 below the crest?

A. If necessary, we would, yes, sir.

Q. Do you—I asked you if you do?

A. Yes, sir.

Q. Whenever it is 0.1 below, you operate the roller gates?

A. Yes, sir.

Q. Of London?

A. Not always; we used the power company since they have been in there.

Q. Do you operate the roller gates at London whenever Marmet drops 0.1 below the crest?

A. No, sir.

Q. That is, in order to get water from London to Marmet?

A. No, sir; you don't operate the roller gates for that.

Q. Why not?

A. We asked the Power Company to change their volume on the turbines.

Q. Now, who is your superior officer in charge of the Huntington District?

A. Mr. Cassell is immediate, and Colonel Conklin is the District Engineer.

Q. Well, let me ask you. You have testified—a variation of 0.8 of a foot, was it?

By Mr. **Thompson**:

~~A.~~ It was 0.7.

By Mr. **Jackson**:

Q. In Marmet—in a period which would rise in Marmet at the rate of 0.8 of a foot in 5 hours—that it would cause trouble to navigation in the Marmet pool?

A. Yes, sir.

Q. Would it do that in any other pool, if the change in stage was at the same rate?

2758 A. It would in any pools below there.

Q. How about London?

A. It would below their draw down.

Q. Why wouldn't it above the draw down?

A. You mean—it would not affect the landing in the London pool. They always prepare to keep their plant out when these draw downs are made.

Q. Will you define what you mean by a "rate of change in stage"?

A. A falling or rising river.

Q. Yes, but what do you mean by a "rate of change in stage"?

A. The speed which it takes to flow.

Q. You mean how rapidly the changes occurred over an hour for instance?

A. For any length of time, yes, sir.

Q. Well, if a rate of change of stage of 0.7, did you say?

By Mr. **Thompson**:

A. It was 0.8.

By Mr. **Jackson**:

Q. (Continuing.)—of a foot an hour—no, five hours rather—strike that. That would be how much an hour—0.8 of a foot of change in five hours, would be how much in one hour?

A. It would be what?

Q. Strike that out. Assuming the rate of change to be 0.8 of a foot in five hours, how much would that be in one hour?

A. It would be .1, wouldn't it?

Q. 0.1 of a foot?

A. 1.3—I don't know.

Q. It would be 0.16 of a foot in one hour, would it not?

A. 0.5 in an hour.

Q. You testified that a rate of change of 0.8 of a foot in five hours, would be injurious to navigation. I am asking you to tell me what rate that would be in one hour. I get it 0.16 of a foot; is that right?

A. It would be 0.1 an hour—0.5 in 12 hours.

2759 Q. Eight you said?

A. In five.

Q. In five hours. I do not want to confuse you. Tell me what you compute the rate of change for one hour to be, on the assumption of a change of 0.8 of a foot in five hours?

A. (Witness is handed paper by counsel and figures.) It would be one and three-fifths, tenths.

Q. The same as 0.16, isn't it? Is that right? I am trying to agree on a figure, so that we may proceed.

A. I will agree with you.

Q. If, in your opinion, 0.16 of a foot an hour in the rate of change in stage in the Marmet pool, would have an adverse effect on navigation, what would you say as to the effect of a change of stage at the rate of one-half a foot an hour?

A. A half a foot an hour?

Q. Yes, sir.

A. The effect would be greater.

Q. That would be the same as a change of 2½ feet in five hours, wouldn't it?

A. Something like that.

Q. And you regard that as more dangerous?

A. Sure.

By Mr. Jackson. Here is a paper which I desire to have marked for identification as Defendant's Exhibit No. 608.

(The foregoing paper was marked as indicated.)

Q. Are you familiar with the signature of Colonel Conklin?

A. Yes, sir.

Q. Did you ever see his signature?

A. Yes, sir.

Q. I show you a signature on Exhibit No. 608, marked for Identification for the defendant, and ask you if that is Colonel Conklin's signature. [Exhibits to witness.]

A. Yes, sir.

Q. I read to you from Colonel Conklin's letter, dated June 26th, 1936, addressed to the Kanawha Valley Power Company, and signed by Colonel Conklin, the following passage on page two.

2760 Q. I invite your attention to this. It is entitled "Subject: Kanawha River pool fluctuations resulting from operations of the London and Marmet hydro plants.

"Following some discussion, it was agreed to proceed as follows, with the understanding that the procedure is subject to such modifications as developments may necessitate.

"(a) The rate of draw down in the London pool will not exceed ½ foot an hour."

Q. (Continuing.) And I ask you whether or not this rule of operation by Major Conklin affects your judgment as to what, if any, effect would be produced on navigation by the decrease in stage in the Kanawha River pools at the new dams at the rate not to exceed ½ of a foot an hour?

A. Is that the London pool?

Q. Yes, sir. Would that affect your judgment?

A. Not a bit in the world.

Q. You think that that decrease in stage at that rate, in the London pool, would not have any adverse effect on navigation?

A. Below?

Q. No, in the London pool?

A. They can draw from the pool to 3 feet.

Q. Do you think that change in rate in stage, at the rate of ½ of a foot an hour on the London Pool, would have any adverse effect on navigation in that pool?

A. Yes, sir; I do.

Q. You disagree with this rule of operation, that the rate of draw down for the London Pool was not to exceed ½ a foot an hour?

A. That is right.

Q. I direct your attention to the next paragraph from this letter. [Reading.]

2761 "(b) The level of the Marmet Pool will be kept within the range of plus 0.0 and minus 0.3 and pool oscillation on the lower gage at London due to turbine operations, will not exceed the rate of ½ foot per hour.

Q. (Continuing.) Do you understand that that would permit drops or dips in the Marmet Pool to the extent of 0.3 of a foot—a decrease in stage in Marmet Pool not exceeding, at the rate not to exceed ½ of a foot an hour?

A. You mean at Marmet, at the rate of 0.3 of a change?

Q. Yes, sir.

Q. (Continuing.) That provides for a draw down of 0.3 below normal pool level in Marmet?

A. We haven't such orders.

Q. Doesn't this letter say that?

A. Yes, sir.

By Mr. Jackson:

Q. Does the letter provide for a decrease of stage in the Marmet Pool at a rate not exceeding ½ of a foot an hour?

A. It certainly does. The letter says so.

Q. Do you agree with those methods of operation of the Marmet Pool outlined by Mr. Conklin in his letter, marked defendant's exhibit for identification No. 608, and which I have just read to you?

A. Do I agree with it?

Q. Yes, sir.

A. Not in toto, no, sir.

Q. To what extent do you agree with it?

A. I disagree with the London draw-down. He knows it himself—that I disagree with the draw down.

Q. A half a foot an hour?

A. Yes, sir; and my orders have never been changed.

Q. Does he know that you disagree with the minus 0.3?

A. I don't suppose so.

2762 Q. You had a disagreement with him about the half a foot an hour, did you?

A. I simply talked with him.

Q. Have you got the records of the actual operation of the gates of the Marmet Pool with you?

A. No, sir.

Q. Have any of your assistants in the Court Room those records with them?

A. I don't know whether they have or not.

Q. Will you find it, because, if so, I would like to see the records.

A. Just since February, he says. [Witness answers this question as result of information from a voice in Court Room.]

Q. Will you produce those since February?

A. They are at the hotel.

By Mr. Jackson:

Q. Mr. Carpenter, I think you said Colonel Conklin is your superior officer in charge of the operations of the Huntington District?

A. Yes, sir.

Q. And he is the officer who gives the final orders as to what is done by you and everyone else in the district, is he?

A. Yes, sir.

Q. And he has under his jurisdiction the operation of the navigations works of the Ohio River in that district?

A. Yes, sir.

Q. And he also has jurisdiction over the operations of the power plant on the Government navigation dams at London and Marmet?

A. Yes, sir; I presume so. I don't know.

Q. You——

By Mr. **Thompson**:

Q. What was the answer?

A. I presume so.

2763 By Mr. **Jackson**:

Q. You don't know that?

A. No, sir.

Q. You know, don't you, that these power stations on the navigation dams are operated under licenses from the Government, don't you?

A. Yes.

Q. And you know that the district engineer, Colonel Conklin, has supervision over that?

A. I am not so sure of that.

Q. You are not?

A. No, sir.

Q. You don't think that you have supervision instead of him, do you?

A. No, sir; I know I haven't.

Q. To the extent that any supervision that is exercised, you know that it is exercised by Col. Conklin, don't you?

A. If we get into trouble, we turn it over to the district office, and there our trouble ceases.

Q. You don't know anything about it from that time on?

A. I have nothing to do to correct it.

By Mr. **Thompson**:

Q. What?

A. From the time they get it from the office, we don't go into how they do.

By Mr. **Jackson**:

Q. From the time they get what, you don't go into it?

A. If we get a complaint from the lock-master that something is going wrong, we immediately notify the Huntington office—usually Mr. Cassell.

Q. And then you are through with your part?

A. I have done all I can do.

Q. You report any groundings you know about to the Huntington office, don't you?

A. If they are serious.

2764 Q. If they amount to anything, you do?

A. Yes, I report them to my superior officer.

Q. And you have reported to Col. Conklin's office every grounding that has come to your attention since the Marmet plant started that you regarded as serious?

A. Every one that I regarded as serious.

Q. Now, when were the groundings generally that you were talking about on direct examination?

A. Do you mean the dates?

Q. Yes.

A. I don't remember.

Q. You have no date?

A. I did not keep any date of them; they were too numerous.

Q. Did you say there was trouble at one place in the Marmet pool, at Houston?

A. At Houston.

Q. How do you spell it?

A. H-o-u-s-t-o-n.

Q. Is that the full name of the place?

A. Yes, sir.

Q. What is it—a landing?

A. Yes, sir.

Q. Of a coal company?

A. That is right.

Q. And where is that located?

A. The landing is probably a mile or such a matter below Houston.

Q. How far is it below the London dam?

A. Probably two miles, or something like that—two or three miles.

Q. What kind of trouble develops there?

A. Grounding of barges.

2765 Q. Where—in the channel?

A. No; in the landing.

Q. Is that the same as a harbor?

A. The same.

Q. What is there? Just a place to tie up?

A. A coal tipple.

Q. Is that the place where the most trouble is?

A. Not particularly there. Wherever they tie up or have a landing.

Q. I thought you said that was the place where they had the most trouble?

A. That is the shallowest place.

Q. The trouble is that it is a pretty shallow landing, isn't it?

A. That is right.

Q. How long has that landing been there?

A. I don't know.

Q. That has been there a good many years, hasn't it?

A. Yes, sir.

Q. Was that landing in the old No. 3 pool?

A. Yes, sir.

Q. What is the elevation of the new Marmet pool with reference to the old elevation of the old No. 3 pool?

A. I don't just remember. [Witness looks at memorandum.]

By the COURT:

Q. Where is the old No. 3 dam—between Marmet and London?

A. Yes, sir.

By Mr. JACKSON:

Q. About how many miles below London is the old No. 3 dam, Mr. Carpenter?

A. Three miles and a fraction.

Q. Will you tell me what the elevation of the present Marmet pool is compared with the elevation of the old pool No. 3?

2766 A. The old No. 3 is 591.57 elevation, and Marmet is 590.0.

Q. Then the elevation of old No. 3 pool was 1.57 feet above the elevation of the present Marmet pool?

A. Yes, sir.

Q. When the present Marmet pool was constructed and the old No. 3 destroyed, the landing was lowered 1.57 feet, wasn't it?

A. Yes, sir.

Q. And do you think that had anything to do with the landing at Houston?

A. The landing could have filled up.

Q. What is that?

A. The landing could have filled up.

Q. Do you think the lowering of the elevation, when they took out old No. 3, had anything to do with it—the lowering of the pool?

A. I don't think so.

Q. You do not think that had any effect, do you?

A. No.

Q. It did, however, decrease the water 1.57 feet, didn't it?

A. It raised the water 1.57 feet.

By Mr. **Thompson**:

Q. It did what? Raised it or lowered it?

A. (Witness looks at memorandum.) There is a difference 1.57.

By Mr. **Jackson**:

Q. Which way?

A. Raised.

Q. It raised it?

A. Yes, sir.

Q. Will you give me the elevation of Marmet pool?

A. 590.

Q. What is the elevation of pool 3?

A. 591.57.

Q. Is the elevation 591.57 lower than 590?

A. It is higher; 591 is higher than 590.

2767 Q. When you took out dam 3, did that lower the lev of the water above it, or not?

A. It lowered it.

Q. And it was lowered at one point 1.57 feet?

A. Yes.

Q. You do not think that had anything to do with the difficu ties at the landing at Houston?

A. It could have.

Q. You don't think it likely?

A. No.

Q. Then would you think the same thing would be true of an other landing, that the lowering of the water 1.57 feet woul not have any effect?

A. At any other landing?

Q. Yes.

A. Yes, surely.

Q. You think it would have an effect in another landing?

A. Yes.

Q. Now, Mr. Carpenter, the Government provides a throug channel down the Kanawha River, doesn't it?

A. It provides a channel.

Q. It dredges a channel down through the pool that is use by navigation going up and down the river?

A. That is right.

Q. The harbors or landings, as you call them, are provide by private interests that use them?

A. Yes, sir.

Q. And the depth of those harbors and landing depend o how deep the private interests choose to dredge the landing an the entrance to it?

A. It depends on the keeping of normal pools.

Q. Assuming that a pool is at normal level, does the depth of water at the landings and harbors depend upon the depth to which the private interests using those landings and harbors have dredged them?

2768 A. That is right.

Q. And that dredging is done by private interests at their own expense?

A. Most always.

Q. It is unless sometimes a city will provide, at its expense, a landing or harbor?

A. Yes.

Q. And the Federal Government has nothing to do with maintaining either one?

A. No.

Q. And do these landings, private and municipal, fill up with silt and coal dropping off barges?

A. Yes.

Q. And they tend to get shallower from time to time by reason of those phenomena, don't they?

A. That is right.

Q. And if the private interests and municipalities do not choose to dredge pretty soon, they will soon have trouble at these landings and harbors?

A. If they don't keep them cleaned out they will get shallower.

Q. And this does happen, doesn't it?

A. Yes, sir.

Q. Now, what causes groundings there at the power station operations?

A. Fog and current.

Q. Anything else?

A. Any fluctuation in the water, or any sudden drop of water, will cause it.

Q. Does it make any difference to what draft the vessel is loaded?

A. Oh, sure.

Q. If the vessel were loaded to nine feet, on an elevation of ten feet, and the water dropped anything less than a foot, there would not be a grounding, would there?

A. Yes.

2769 Q. If it dropped a half a foot, under those circumstances, there would be a grounding?

A. I thought you said a foot. As far as moving steamers, it is not enough.

Q. The fact is, of course, Mr. Carpenter, that questions of groundings are affected by the depth to which the barges are loaded?

A. Quite a bit.

Q. And when one is trying to flank around a channel, as you have been talking about, the operator sometimes does not maneuver perfectly and runs against the bank of the channel, doesn't he?

A. Occasionally that is the case.

Q. Now, as to any of these groundings that you testified about, do you know the draft to which these barges were loaded in any particular instance?

A. I do not recall them just right now.

Q. So you can't give me now any specific grounding, or the date, or the draft to which the barges were loaded?

A. I can't give the date.

Q. Is it any part of your business to find out about the drafts?

A. That is the lock-master's business to find out the drafts of the boats.

Q. When you investigated grounding did you investigate the draft to which the barges were loaded?

A. Sometimes. It is my business to get them out.

Q. Your principal job is to get the barge released and you don't pay much attention to what the draft might be?

A. I would pay attention to them sometimes.

Q. You simply report the circumstance of the grounding to your superior officer in the District Engineer office and from that time on you have nothing to do with it; is that right?

A. Not until they are afloat.

Q. After you have performed your duty in trying to get the tow
or barge afloat you simply report the circumstances to the
2770 District Engineer office and you have nothing further to
do with it?

A. After the barge is afloat.

Q. You make no further investigation of draft or other conditions that obtained at the time of the grounding?

A. I might, to know what the draft is at the time. I must know that.

By Mr. **Thompson**. What the draft is?

By the **Witness**. Yes, sir.

Q. You have testified about some of this grounding you thought was due to the operation of the Marmet plant. You didn't know that definitely, did you?

A. That was the cause of it. Yes, I knew that.

Q. You were very clear about that?

A. Yes, sir.

Q. You reported that to Col. Conklin?

A. I never report direct to him.

Q. Did you report to your immediate superior?

A. That is right.

Q. Told him that?

A. That is right.

Q. Did you ever find a case where a barge or tow rather had gotten out of the channel?

A. Yes, sir.

Q. That happens quite frequently, doesn't it?

A. Yes, sir; right often.

Q. And if you get out of a channel you are likely to ground a great many places?

A. Yes, sir; if you get out seriously.

Q. Does the river naturally at times vary more rapidly or less rapidly than a power station variation?

A. You mean from the cause of the power station?

Q. No; natural variations from rain and the like, are they more or less rapid than variations in discharge at the power stations?

A. Usually, we have had as much as a foot of rise an hour at Kanawha Falls.

2771 Q. From natural causes?

A. Yes, sir.

Q. And I think you said something about variations at the wicket dams or pools above those dams, do you maintain the levels in the pools above those wicket dams with mathematical precision?

A. Did I understand you to say above the roller dam?

Q. No, pools above the wicket dams?

A. As close as we can.

Q. You do have a good deal of variation, don't you?

A. Only at times.

Q. For instance, if you have the wickets up you won't put them down until there is a considerable depth of water flowing over the wickets?

A. We never, if possible, let it exceed over one foot.

Q. It may rise as much as one foot above then?

A. Only in some unusual case. For instance like we know water is coming behind it for instance like a wave from a power plant, you know it is going to subside, then we don't operate the wickets so often.

Q. Starting from pool level and assuming a rate of rise of one-half foot per hour for two hours would any interference with boats result?

A. Yes, sir.

Q. What would be the character of the interference?

A. At the dams while locking the foot of water in one hour will set up cross currents and make it hazardous to enter locks, and also increases the current in the chutes to such state it makes it bad to navigate.

Q. Are they dangerous after they have risen an hour?

A. 5/10 an hour?

Q. No, after they have risen for an hour, are they dangerous?

A. Surely, when entering a lock.

Q. Don't you often have conditions where the water is higher than that?

A. Yes, but we keep the pools down. If natural conditions we keep the pools at around normal, and if only going to be for a short period of time let more go over the crest of the dam than otherwise.

Q. In time of high flow, how can you prevent a rise of
2772 one foot or two feet in an hour?

A. You mean at the dam? We let the wickets down.

Q. How does that prevent rise in the upper end of the pool?

A. It doesn't on the wicket dam, we can't help anything, the dams must be taken out of the way; must be lowered. We keep it down to a certain stage at the dam.

Q. You can't keep it down when the water has risen?

A. Then we have an open river when the dam is lowered, nothing we can do about it.

Q. Is #6 pool dangerous when the water stands two feet above normal pool level at the upper end?

A. That doesn't happen very often, two foot——

Q. Will you answer the question.

A. It is dangerous.

Q. Starting from pool #4, or normal pool level in pool #6, if the power station at Marmet is in full operation, how much does the water rise at the head of #6 pool?

A. That will vary.

Q. If the pool is at normal pool level, and the power station is operating at full capacity, it won't vary, will it?

A. It certainly will cause us to operate our wickets at #6.

Q. Will that affect the rise at the upper end of the pool?

A. It will continue to be a certain wave, and will stay at that point.

Q. How much rise will there be?

A. I could not tell you. I would have to have the records to do that. It would fluctuate as we operate the dam.

Redirect examination by Mr. **Thompson**:

Q. How many complaints did you have on pool #6 before the Marmet dam was put in operation?

A. Very few.

Q. And how many have you had since?

By Mr. **Jackson**. That is not proper redirect.

By Mr. **Thompson**. You were asking about the effect on the #6 pool.

By Mr. JACKSON. Counsel put him on on rebuttal and questioned him about groundings, and now he wants to take in another field.

By the COURT. He may answer.

2773 A. We have each time the power plant is operated, after the close off, we will have probably four or five complaints each time in that pool.

By Mr. THOMPSON:

Q. Counsel asked you about the trouble at Houston landing. What caused the grounding at the Houston landing, if you know?

A. Because the first draw-down of the London pool [interrupted].

Q. The Marmet or London?

A. It was caused through the Marmet and London.

Q. Where?

A. Down by the Marmet pool, caused by that, but the reason of it was after the draw-down in the London pool, the water was closed off so suddenly it made a trough.

Q. You mean it made a trough in the Marmet pool?

A. That is right, Marmet did not shut their power plant down soon enough.

Q. Does the Government dredge at Charleston harbor, do you know?

A. Sometimes at the city landing only.

Q. Does the Government maintain the Charleston harbor otherwise?

A. No.

Q. Counsel asked you about boats getting out of the channel. They Don't get out of the channel on purpose, do they?

A. Certainly not.

Q. You were asked the first time you had considered or discussed waves with your superior. Was that the first time you had ever observed or considered waves?

A. No, sir.

Q. Did you ever see waves on the Ohio when you were on that river?

A. Yes, sir.

Q. And observe and study them?

A. I created them and followed them out.

Q. You mean down the river?

A. That is right.

2774 Q. You spoke about the water going over the top of the dam. I don't know I got clear your explanation. I had some difficulty hearing you. You mean by that it goes over the roller gates?

A. Only one of them, one has a flap on it, they call it the "flap roller" and it is permissible to spill water over that.

Q. It doesn't mean it goes up all the way over the top of the dam, does it?

By Mr. JACKSON. I object to the question as leading.

By the COURT. Let him answer.

By Mr. JACKSON. Exception.

A. No.

Recross-examination by Mr. JACKSON:

Q. You have just told counsel in response to his question the water doesn't go over these dams except through the flap; didn't you tell me at various times the water did go over the gates and that you didn't know how deep it went over?

A. Just in a swell or surge when it would run over.

Q. Never any other way?

A. None I know of.

Q. You don't really know?

A. Sure I know.

Q. How do you know?

A. They tell me they will permit it to go over a few minutes.

Q. Who told you?

A. The lock master.

Q. What did you mean when you told me you didn't know how deep the water at times flowed over these gates?

A. I don't know.

Q. And you don't know how long at times it flows over those gates?

A. Not very long.

Q. You don't know how long, do you?

A. Not very long.

By Mr. THOMPSON. Why don't you say how long if you know?

By the WITNESS. I don't know the exact time.

By Mr. JACKSON:

Q. What was the date you observed this trough at Houston?

A. I don't remember the date.

Q. Did you see it?

A. The trough?

2775 Q. Yes.

A. No; I was at the landing and didn't pay any attention.

Q. You didn't see it?

A. I did not.

Q. Will you get the date for me?

A. I don't know where I would get it. We don't keep dates of those.

Q. You don't make any record of the troubles you investigate?

A. No more than where I have it.

Q. I would be very interested in knowing the time of the trough you saw. You can't help me out on that.

A. I don't know or I would tell you.

Q. And it dropped the water so much below the pool level it grounded?

A. It grounded.

Q. It dropped the water so much below the pool level it grounded?

A. As it went by, yes, sir.

Q. What year was that?

A. That was last year.

Q. Sometime in 1935?

A. Yes, sir.

Q. Would you say in summer or fall?

A. I don't remember the time.

Q. Probably in the middle of the summer?

A. I don't recall the time.

Q. You do recall it was some time last year, don't you?

A. Yes, sir.

Q. You are definite about that?

A. Yes, sir.

Q. You didn't know the plant was not in operation last year?

A. Sir.

Redirect examination by Mr. Thompson:

Q. Was this grounding before or after the Marmet

2776 project started operating?

By the Court:

Trough or something.

A. It was one of their test runs.

Q. At the Marmet?

A. Marmet and London. I don't recall the time.

By the Court. Where do you live?

By the Witness. Point Pleasant, West Virginia.

By the Court. You work up and down from there?

By the Witness. Yes, sir.

2777 **Rowland P. Castle**

Direct examination by Mr. Gatchell:

Q. Please state your name and present occupation?

A. Rowland P. Castle; Chief of the Operation Division United States Engineers Office, Huntington, West Virginia.

Q. How long have you held this position?

A. Since June 4th of this year.

Q. What has been your experience during the past five or six years?

A. In 1929 I started work for the United States Engineers Office at Huntington and at Marietta, Ohio. I was there about a year and a half, and about March 1931, was placed in charge of the Engineers Office at Catlettsburg, Kentucky. That office was in existence until August 1932. I was then transferred to the Point Pleasant office, which was formed at the time the Catlettsburg office was disbanded, and was there about six months as Assistant to the Engineer in charge of that office.

I was transferred then back to the Huntington office, and for a period of about two months I was called Assistant to the District Engineer who, at that time, was Major Herman.

When Major Herman left the District, the Navigation Section was organized, and I was placed in charge of that Section.

Q. And what were your duties when you were placed in charge of the Navigation Section?

A. It was my duty to make regular trips over the river, at least two a month, by a launch, and then to ride tows navigating the river in the Huntington District from their origins.

By Mr. **Jackson**:

Q. When was that?

A. In August 1934, I was placed in charge of the Navigation Section.

2778 By Mr. **Gatchell**:

Q. During the time that you were in charge of the Navigation Section, did you talk to the navigators and pilots on the Ohio and Kanawha Rivers regarding operating conditions?

A. Yes, while I was on these tows I, of course, would spend most of the time in the pilot houses, and that was the reason for being there, to see what difficulties they encountered and what remedies we could put into effect to overcome those difficulties.

Q. What are your present duties?

A. Chief of the Operating Division, and, as such, I am charged with the responsibility of the operation of the dams and pools and project depths, dredging, and expenditure of all funds in connection with the operation of locks and dams.

Q. Does Mr. Carpenter serve under you?

A. He does.

Q. Do you serve under the District Engineer?

A. That is correct.

Q. And all reports on the operation of the Ohio and Kanawha River dams are sent to you?

A. Yes, I get routine reports twice daily, and any extraordinary operations that occur we get reports by telephone.

Q. Do you get reports of gage readings on the Kanawha and Ohio Rivers?

A. Yes, twice daily.

Q. Do you get reports at Marmet?

A. I get reports at the time the gage heights are taken. That is a routine.

Q. How many such reports do you get a day?

A. Two a day—one in the forenoon and one in the afternoon.

Q. Does Mr. Carpenter report all complaints of navigation difficulties to you?

A. No. He reports only major complaints.

2779 Q. He reports major complaints to you?

A. Yes.

Q. In addition to those, you have, yourself, talked to many of the navigators on the Kanawha River?

A. Yes, sir.

Q. How long have you been advised of complaints of navigation difficulties on the Kanawha River?

Mr. JACKSON. We object to this testimony as not in any way proper rebuttal. Apparently it is an attempt to go further into proof of alleged navigation difficulties or groundings in the Kanawha River. They offered proof of that through Capt. Elsey, and now, if they are to reopen their case on that subject, we would be compelled to inquire into it and also offer evidence in surrebuttal. It seems to me improper for them to go into that further.

The COURT. The trend of these preliminary questions seem to do that, but I can't tell yet.

Mr. JACKSON. I did not want the witness to tell of the alleged complaints, and I think that is what the question called for.

NOTE.—The question was read as follows:

"Q. How long have you been advised of complaints of navigation difficulties on the Kanawha River?"

Mr. JACKSON. I submit, that is improper. It cannot have any bearing except going into further proof.

The COURT. You may answer that question.

Mr. JACKSON. Exception.

A. Since I was placed in charge of the navigation section.

By Mr. GATCHELL:

Q. Had the Marmet dam been completed at that time?

A. It had.

Q. How long since?

A. This was about two or three months after the actual completion of the Marmet dam.

Q. When was the power plant at Marmet placed in operation?

A. It was sometime after that. I think about December, 1935.

Q. Mr. Putnam testified in this case for the defendant that the rate of increase in the flow in the Marmet and Winfield pools would have no effect upon navigation until the discharge reached a point which he terms destructive.

Mr. **Jackson**. I think it is where the current reached a point where it is obstructive.

Mr. **Gatchell**. I only have to go by what he said. I will read from page 5285: "The rate would have no effect until the discharge had reached 30,000 second feet. At that point, or in the vicinity of that discharge, the current velocities begin to become what I would term destructive."

Mr. **Jackson**. It is "obstructive."

The **Court**. Go ahead with the question.

By Mr. **Gatchell**:

Q. Would the rate of increase in flow in the Marmet pool have any effect upon the navigation prior to the time when it reached a high velocity?

A. Yes.

Q. How would it have any effect?

A. The rate of increase in flow—of course, a rise in the river will set up higher current velocity than was in effect before this rate of increase started, and that necessarily will slow down the operation of the tow in transit, and especially in the upper pool.

Q. When a tow is proceeding up-stream in the Marmet pool, does the velocity of the current have anything to do with the speed at which that tow can move?

A. Yes.

2780 Q. If that velocity is increased, what happens?

A. The speed of the tow is correspondingly decreased.

Q. Now, if the in-flow into the Marmet pool should be increased at a rate not exceeding 6,000 second-feet per hour, for not more than two hours, what would be the effect upon barges and tows operating in the Marmet pool?

A. During the time of the assumed increase in rate of flow, the velocities would be increased to some extent and the speed in transit would be decreased accordingly.

Q. What would be the effect upon tows and barges that are tied up along the banks?

A. The increased discharge would produce a fluctuation in the pool elevation and increase it, and after that discharge had receded, dropped down to normal again, there would be a corresponding drop. This would ground barges that were tied into the shore, loaded barges especially, with a clearance of three- or four-tenths under the barge.

Q. And is it necessary to tie up on the Kanawha River on account of fog?

A. Yes, very often.

Q. Do fogs occur very frequently?

A. During certain seasons of the year they do.

Q. Are any of those seasons during low water?

A. Yes.

Q. When a tow is tied up in a fog, does the navigator have an opportunity to pick the spot at which he will tie up?

A. No. The fact that he had to tie up on account of a fog does not allow him to pick the point that he will tie up. He has to tie up where the fog hits him.

Q. What is the method of tying up with spars?

A. That applies to floating plants, barges, and so forth, that might be moored in the harbors, and it might be the method 2781 to keep the fleet at a fixed distance from the shore line so it cannot be crowded in on the shore and grounded. It holds the tow in fixed relation to some definite object on the bank.

Q. How many barges are in tows operated on the Kanawha River?

A. The average tow would be about six barges.

Q. And how many spars would such a tow have to use in sparring out?

A. They would have to have at least two.

Q. How many tie lines would they have?

A. That depends on the judgment of the master of the boat. He should at least have one, if not two, head lines out on the head of his tow, and then a breast line, a spring line, and possibly two lines on the down-stream end of the tow.

Q. And how long does it take to get a tow sparred along the bank?

A. This sparring, of course, occurs in the harbors, and they are all equipped for that sort of work, and, even at that, it would take a period of from two or three hours, with five or six men, to spar it.

Q. If, while they are sparred out, there is a change in the stage of the river, up or down, in the Marmet pool, what effect does that have upon the sparring out?

A. Within certain limits the spars do not have to be changed, but when it goes beyond that limit it requires a resetting of the spars and practically starting from scratch.

Q. If they should have to change the spars, how long would that operation take?

A. If they are equipped with derrick boats, they can change rather rapidly, but, even at that, I do not think it could be done in less than two or three hours, and, if they have to do it by hand, it is a much longer operation.

2782 Q. Are you familiar, in a general way, with the plans for the Winfield dam?

A. Yes.

Q. Do you know the elevation of the pool behind that dam?

A. Yes.

Q. What is the elevation?

A. 556.

Q. And what is the elevation of the present No. 6 pool?

A. 563.15.

Q. So that the elevation of the No. 6 pool will be raised how much?

A. It will be raised 2.85 feet.

Q. Is the No. 6 pool dug for any particular depth of channel?

Mr. Jackson. I object to this as not proper rebuttal.

The Court. That question itself is not, but it may lead to something else.

Mr. Jackson. Exception.

Note.—The question was read.

A. Yes, at present, within the last two years, the control points in pool No. 6 have been dredged to sufficient depth to permit nine foot navigation in that particular section.

By Mr. Gatchell:

Q. Major Putnam testified that if there were an increase in stages at the head of Winfield Pool at a rate not exceeding two feet per hour, the rate would have no effect until the discharge had reached 30,000 second feet; will you tell us what you think of that statement?

A. With the rate of not exceeding two feet an hour, there will be considerable fluctuation in pool elevation; there will be an increased velocity, and, in my opinion, at a maximum of two feet an hour, it would be practically impossible for a tow of any size to actually get into the lower approach to the locks.

Q. Why could they not get into the lower approach to the locks?

A. The increased velocity would just about prohibit the movement of that tow.

Q. What is the effect upon the water around the lower approach to the lock?

2783 A. If this discharge was coming through the roller gates of the dam, it would be spread over about 500 feet of river. That would set up one set of current, which would be bad, and especially bad on the tow at the time it had to cross from the left side of the channel over to the right side of the channel in order to enter the lock, because the effect of that current would be pretty much broadside on the tow.

By the COURT:

Broad on which side?

A. The left side of the river. The lock is close to the left side.

By Mr. GATCHELL:

Q. Do they have to cross over the river immediately below the Marmet lock?

A. Yes, there is a rather short crossing there.

Q. What effect would it have upon boats moving up or down in the area now occupied by No. 6 pool, if there was this rate of increase in the Winfield pool?

A. The effect of the velocity will, of course, vary at different points in that pool, but down as far as lock 6 you have a sharp constriction of the channel at Biain's Island, and immediately above is Elk Chute, and there is a very narrow channel there, and at Donnally's Bar, immediately above Elk Chute, and a few miles above that there is a stretch of river known as the Levy Crossing, where there is a dredged channel of at least two miles, and it extends from below the Marmet dam to the entrance to the locks. Through these various constrictions, the velocity will be increased. Down bound, those in approaching these particular areas will necessarily have to slow down, because they will not be able to go through with safety at the same speed of water. They will actually be backing up in going through.

Q. What would be the effect upon a tow in the Marmet pool under a raise at the rate of a foot and a half and hour—not exceeding two hours?

2784 A. In the upper limits of the Marmet pool, from just below Paint Creek on up to the London lock, which is a distance of about three miles, you would have increased velocities and a considerable variation in the direction of the action of the current.

By the COURT:

Have you seen these conditions you are speaking of actually happen on the river, or are you speaking theoretically?

A. I have seen tows which could not get through the chutes because of the velocity of the water through the chutes.

By the COURT:

I am speaking of what you say as to the locks: Have you seen those conditions on the river which you narrated?

A. Yes.

By Mr. **Gatchell**:

Q. You have been actually on the river when there has been a variation of flow below the Marmet pool?

A. Below the Marmet lock. Yes, I have been through there when tows were having considerable difficulty in getting through.

Q. Have you been on the Marmet pool when tows were having difficulty in getting up that pool?

A. Not in the Marmet pool, no.

Q. How long does it take a barge tow, proceeding up-stream, to pass through the length of the Marmet pool in normal low water?

Mr. **Jackson**. I object to that as not proper rebuttal.

The **Court**. It may be preliminary to something else.

Mr. **Jackson**. Exception.

A. The average tow moves at a speed of between two and a half to three miles an hour under normal conditions. Under low water, it would take five or six hours.

By Mr. **Gatchell**:

Q. How long would it take the same tow to pass up-stream through this pool if, at the time it entered the Marmet pool, the discharge in the head of the pool had increased at the rate of 6000 second-feet per hour, and, thereafter, progressively increased 6000 second-feet per hour for three additional hours?

2785 A. The tow would be slowed down by the same amount and the same velocity that the natural flow was increased, due to this increase of flow of 6000 feet.

Q. Would there be any difficulty in keeping in the channel in the Marmet pool?

A. In the upper limits of the pool, above old lock 3, I would say yes.

Q. And what effect, if any, would such an increase of flow at the head of the Marmet pool have upon an average two proceeding down-stream from the upper end of Marmet pool?

Mr. **Jackson**. I object to the competency of the witness to answer this question. It is purely theoretical.

The **Court**. I will let him answer it.

Mr. **Jackson**. Exception.

A. It would increase the hazards that would naturally accompany the tow in navigating that section of the river which has not been extensively improved below the old low water channel.

By Mr. **Gatchell**:

Q. Professor Thomas testified that some storage and re-regulation of power waves reaching Kanawha Falls could be secured on the Marmet pool. Under present conditions, do you permit fluctuations in the level of the Marmet pool?

Mr. Jackson. I will ask a qualifying question. Mr. Castle, are e regulations or orders to the lock-master in writing?

Witness. I have never seen them.

Mr. Jackson. Mr. Carpenter testified yesterday that they are in riting.

Witness. They may be, but I have not seen them.

Mr. Jackson. You don't know anything about them?

Witness. No, sir.

Mr. Jackson. Mr. Carpenter testified yesterday that they are in riting, and I object to any testimony without producing the ecord.

Mr. Gatchell. This witness has qualified himself as being in harge.

The Court. I understand that. This witness said that he doesn't now of any written orders about it.

Mr. Jackson. Their own witness has testified that they are in riting.

The Court. I do not recall what Mr. Carpenter said, but, preuming he said that, there is a difference of opinion or a different tatement between him and the chief.

Mr. Jackson. Exception.

By Mr. Gatchell:

Q. Under present conditions, do you permit a variation in the levation of the Marmet pool?

A. The lock-master at Marmet is instructed to maintain his ool elevation at one-tenth of a foot below the crest of the dam, which is equivalent to a stage of 17.9 feet on the upper gage. The peration of the power plant in connection with that dam allows he use of an additional two-tenths of a foot on the gage right at he lock, which means that the fluctuation can be from 18.0 to 17.7 n that gage.

By Mr. Gatchell:

Q. At what elevation do you keep your working pool level?

2786 A. At 17.9.

Q. Which is 1/10 foot below the crest of the roller gates?

A. Yes, sir.

Q. As I understand you, you permit them to draw down 1/10 of a oot below your working pool elevation?

A. Yes, sir.

Q. I show you paper marked for identification Govern-
2787 ment Exhibit #263, purporting to be a letter signed by John F. Conklin, Lt. Col., Corps of Engineers, District Engineer, addressed to the Kanawha Valley Power Company, Charleston, West Virginia, under date of June 26, 1936, subject,

"Kanawha River pool fluctuations resulting from operation of the Marmet and London hydro-plants", and ask you if you recognize that paper?

A. Yes, sir.

Q. What is it?

A. It is a copy of a letter that was written in the Huntington, West Virginia office, as a result of a conference between Mr. McCormack and Mr. Ellis of the Kanawha Valley Power Company, at which conference a method of operation was proposed and tentatively accepted, which would result in the [interrupted].

Q. Were you present at the conference?

A. Yes, sir.

Q. And was any agreement reached in that conference?

Q. What was that agreement respecting?

A. The operation of the power plant.

Q. Was that agreement reduced to writing?

A. The agreement was reduced to writing in a letter to the Kanawha Valley Power Company.

Q. Is this the letter?

A. It is a copy of the letter.

(Said letter, Exhibit 263, being identical with Exhibit 608 marked for identification, was offered in evidence.)

(Exhibit 609, being Letter dated July 10, 1936, to U. S. District Engineer Office, Huntington, West Virginia on "Kanawha River Pool Fluctuations Resulting From Operation of the Marmet and London Hydro Plants"—from Kanawha Valley Power Company, was offered in evidence.)

Q. You are in charge of the operation and maintenance of these pools in the Kanawha River?

A. Yes, sir.

Q. Are dredging operations carried on in the pools?

A. Yes, sir.

Q. Where do you have the most difficulty on the Kanawha River?

By Mr. **Jackson**. I object to that as not proper rebuttal.

By the **Court**. It may be preliminary to something else.

A. At the lower approaches of the locks.

By Mr. **Gatchell**:

2788 Q. What do you mean by lower approaches?

A. That portion of the pool within from right up to the lock gates downstream in some cases as far as two miles.

Q. Is that in the deepest part of the pool?

A. No, sir.

Q. Is it in the shallowest part?

A. Yes, sir.

Q. Mr. Castle, when you were telling about sparring out boats, I didn't quite follow you. Can you tell the Court how much of a rise would affect the sparring?

A. That would depend entirely on the length of the spars. I could not make a general statement about that.

Q. What is the principal complaints you receive of navigation difficulties in the Kanawha River?

By Mr. Jackson. I object to that as not proper rebuttal.

By the Court. Objection overruled.

By Mr. Jackson: Exception.

A. Fluctuating pools, changes in flow.

Cross examination by Mr. Jackson:

Q. Mr. Castle, how old are you?

A. Thirty-six years old.

Q. What did you do before you went to work for the Government in 1929?

A. I was in the contracting business.

Q. Where?

A. In Huntington, West Virginia.

Q. And how long had you been in that business before 1929?

A. Since 1923.

Q. That is, you have been in that business ever since you were old enough to do anything, until you went into the employ of the Government; is that right?

A. No, sir; I had worked before that, and had been to school before that.

2789 Q. Did you go to any professional school?

A. I am a graduate of the United States Military Academy, at West Point.

Q. When did you graduate?

A. 1923.

Q. And have you ever been an officer in the Corps of Engineers?

A. No, sir.

Q. You graduated in 1923?

A. Yes, sir.

Q. Then did you go into the contracting business?

A. Yes, sir.

Q. When?

A. About two months after graduation.

Q. And you continued in that until 1929?

A. Yes, sir.

Q. And then accepted this employment in the Engineer Office as a civilian engineer, at Huntington?

A. I was employed at Huntington and sent to Marietta.

Q. Now what kind of construction work were you doing before you went with the Government?

A. General construction, buildings entirely.

Q. You were not engaged in navigation operations before you went with the Government?

A. No, sir, not in the contracting business.

Q. And any experience you have had in having anything to do with navigation has been since you went with the Government?

A. Yes, sir.

Q. You have not personally ever navigated boats?

A. No, sir, I am not a pilot.

Q. And you have never been in the navigation business yours'lf?

A. No, sir.

2790 Q. Now, assuming Mr. Castle that the flow in the future Winfield pool, at a given time, is 8,000 second feet, will the current be any different whether that flow was attained in the course of two hours or in the course of ten hours?

A. Yes, sir, if the current or flow is attained in two hours the current will be in excess of that during that time than if you attained it in ten hours.

Q. The fact is, is it not, with a flow of 8,000 second feet in the Winfield pool, the current will be the same regardless of how rapidly the river rose, prior to that time?

A. If I understand the question, it is after the flow of 8,000 second feet is reached it will be the same?

Q. Be the same at that time?

A. Same as what? I don't understand.

Q. I want you to tell me whether, in your opinion, when a flow of 8,000 second feet exists at the future Winfield pool, the velocity which will prevail at that time will depend upon the rate of rise in the river prior thereto?

A. A flow of 8,000 second feet will produce a certain current, and that current will be maintained regardless of the rate of rise prior to that.

Q. That is, with a given flow, a certain current will result which may or may not be obstructive to boats, depending upon the velocity of current, isn't that about right?

A. Any flow is obstructive to a boat in transit.

Q. That is your opinion is that every boat going up a river is obstructed because there is some current in the river?

A. Yes, sir, it retards its progress.

Q. Your testimony is based on the theory there is always some obstruction to navigation unless you have completely slack water, with no movement in it?

791 A. Any velocity, natural or otherwise is an obstruction.

Q. That is the sense about which you have been testifying bout obstructions here this morning, isn't it?

A. In my testimony this morning I have based my increases in elocity due to these increases in stage or discharge on an assumed ow in the river, and assumed velocity therefrom.

Q. What is the hydraulic capacity of the Marmet power station, pproximately?

A. I have been told about 10,000 second-feet.

Q. Isn't it about 9,000 second-feet?

A. I don't know the capacity, at the present—the turbines at resent—are operating under a higher head than they will be when e dam is completed.

Q. What is the average flow of the Kanawha River at the Marmet am?

A. In what season?

Q. The average flow?

A. I don't know.

Q. Isn't it in excess of 13,500 second-feet?

A. I don't know.

Q. From your familiarity with the river and river conditions, ouldn't you say that is about right?

A. I wouldn't say it is right. I would say it is probably in excess f that throughout the year.

Q. Doesn't the average flow of the Kanawha River at Marmet xceed 10,000 second-feet more than fifty percent of the time—I on't mean the average, but the flow at Marmet, doesn't it exceed 0,000 second-feet more than fifty percent of the time?

A. I don't know.

Q. Would you say that is not right?

A. I don't know.

92 Q. You testified I think that in your opinion an increase at the rate of 6,000 second-feet per hour in any of these avigation pools existing in the future would create an obructive current in those pools. Assuming, Mr. Castle, a flow of 000 second-feet in the future Gallipolis pool, and assuming that ow was increased by 6,000 second-feet, what would be the resulting locity of current? [Interrupted.]

A. I don't know.

Q. What would be the velocity of current in the Winfield pool sulting from a flow of 6,000 second-feet?

A. I don't know what the velocity of the current would be.

Q. You never have made any study of the current velocities that ould result on any of these pools from various flows, have you?

A. No, sir.

Q. And you don't know, of course, what current velocities would exist in these various pools from a given flow or would result from a particular increase in flow in those pools, do you?

A. I don't know about the velocity, no, sir.

Q. Have you observed, Mr. Castle, whether navigation ceases on the Kanawha River, when the flood flows get as high as 30,000 second-feet?

A. I have seen boats unable to get through certain points on the Kanawha when the flow was less than 30,000.

Q. I am asking if navigation ceases on the Kanawha at 30,000 second-feet?

A. No, sir.

Q. Does it continue, Mr. Castle, when the river is over-flowed?

A. Yes, navigation continues.

Q. Do you know what the current in the river is when it has risen to a stage where it is flowing and inundating the lands where houses are built along the river?

2793 A. No, sir; I don't know.

Q. Be pretty high, wouldn't it?

A. No, sir; be lower.

Q. That is your opinion, the higher the flow the lower the current?

A. At a certain point in the stage of the water.

Q. You testified, as I understood you, if a boat were operating on the London or Marmet pool, and there were a decrease in flow into that pool of, for instance, 6,000 second feet in an hour, it would result in grounding of the tow or the boat; is that about right?

A. No, sir, I don't think I mentioned grounding the boat.

Q. You don't think it would ground, do you, as a result of there being a decrease in flow at the London or Marmet pool of 6,000 second feet?

A. It might or might not, depending on where it was caught at the time.

Q. You know if the boat were not loaded beyond the project depth and the pool did not drop below the project depth, there would be no grounding as a result of the decrease in flow of 6,000 second feet, do you not?

A. If he were in the channel there would be no grounding.

Q. If you get out of the channel you are always in more or less hazard of having a grounding?

A. Surely.

Q. Now, Mr. Castle, you said that when boats were sparred out, that if there is any drop in water level, or at least under some conditions, drops in water level, that it would result in the grounding of the barges. You personally, of course, have not sparred out boats, that has not been any part of your business?

A. I have supervised the sparring out of our own fleets, yes, sir.

2794 Q. The sparring out of the boat is to allow for rise and fall of the water level, isn't it?

A. In part.

Q. And it is the common and usual practice in river navigation to spar out boats for that reason unless you have in some places a dock or wharf constructed, which is not likely to be often?

A. Sparring out is common practice.

Q. And it of course follows when you spar out your barges that so long as there is not a recession of the water that is greater than the amount of clearance you have allowed under your barges, there will be no grounding, is that true?

A. That is right.

Q. And the matter of having these fluctuations and dealing with certain fluctuations within those limits is a part of practical river navigation, isn't it?

A. Surely.

Q. And when there is a recession, there is no effect unless it may be in some instances the necessity of adjusting the hawser, is that what you use to bind the boats, or how is that, a rope as I understand it?

A. It requires considerable more adjustment than a rope. As the river recedes it will be necessary to remove your spars.

Q. That would only be true if you had a recession greater than the amount of clearance provided by your original sparring out?

A. Yes, sir.

Q. And as long as you do not have a recession that does not exceed that, you would not have any such need?

A. That is right.

Q. And isn't it true every time you spar out, you have two or three feet of water under your barges?

A. No, sir.

2795 Q. Isn't that generally true?

A. Not always; no, sir.

Q. But isn't it generally true?

A. I don't think it is.

Q. You would not be willing to say it isn't?

A. In the majority of harbors on the Kanawha River it isn't the case.

Q. You wouldn't say it isn't generally two feet, would you?

A. I don't know of any with two feet clearance.

Q. It all depends on how far they are sparred out and the slope of the bed, doesn't it?

A. Not always, it depends on the depth of the harbor. You can't spar a fleet out sixty or seventy feet, lots of places if you did that the fleet would be in the middle of the river.

Q. In places where there are a perfectly flat, shallow landing, you have a situation where there has never been provided a landing or harbor?

A. These boats are sparred out in what they have provided.

Q. And what they have provided is merely a question of the amount of dredging and work they care to do in providing a landing, by private interests, isn't it?

A. It is up to private interests to provide their harbors.

Q. On these wicket dams, Mr. Castle, navigation proceeds when the wickets and then the passes are down, and the other wickets up?

A. No, sir; that condition never prevails.

Q. The wier goes down first?

A. Surely.

Q. And does navigation then continue?

A. Yes, sir.

Q. And what is the flow in the river under those conditions?

A. With the entire wier down?

2796 Q. Yes.

A. At lock #6 or where?

Q. You can give me different locks.

A. At Lock #6 all the wier will be down at a stage of about four feet on the Falls gage, at about that.

Q. Will the pass still be up?

A. Yes.

Q. So that they will be using the lock?

A. Yes.

Q. And what will be the flow at that point in the river under those conditions?

A. I would have to have a rating chart to see what that discharge is. If I remember right, it would be around 13,000 or 14,000 second-feet, or something like that.

Q. So this navigation continues with a flow of around 14,000 second-feet through the locks?

A. Flow through the locks?

Q. No; the flow in the river is 14,000 second-feet?

A. That is correct.

Q. You testified about your view of the effect of increases or decreases in flow of 6,000 second-feet per hour. The decrease would, of course, decrease the current, wouldn't it?

A. That is correct; yes, sir.

Q. And would that have a compensating beneficial effect on navigation?

A. Of course, the decrease in flow is going to benefit it just as much as the increase in flow hurts the other tow, but as far as navigating any one boat is concerned, I don't think the change is——

Q. The only point I am getting at is, Mr. Castle, if you assume an equal variation up and down, below a certain established flow, the increase will tend to increase the current and the de-
2797 crease will tend to beneficially decrease the current that would otherwise exist; isn't that true?

A. Yes, it makes it easier. A decreasing river makes it easier.

Q. You stated, I think, that if there were an increase of 6,000 second-feet per hour for two hours that that would create current so that the tows or barges couldn't go upstream?

A. At certain locations that rate of rise would stop traffic.

Q. Mr. Castls, assuming a previous base flow of 1,000 second-feet, will you tell me what current would result from an increase of 6,000 second-feet in one hour at the Marmet or Winfield pools?

A. No, sir; I can't tell you the velocity.

Q. That is at the end of the hour?

A. I can't tell you.

Q. Will you tell me what current would result at the end of two hours?

A. I couldn't say that.

Q. Of course, if the original flow were 1,000 second-feet and it increased even in two hours at the rate of 6,000 second-feet, it would still be less than the flow at which you maintain the use of the lock in the wicket dams under present conditions rather than putting them down and using the navigable pass, wouldn't it? That is, you said a while ago that when the flow in the river at the wicket dams would be around 14,000 second-feet and the weir down, navigation would still be using the lock; is that right?

A. Yes, sir.

Q. So that under the conditions I have assumed, it is a mere matter of mathematics.

A. You mean a flow of 7,000 second-feet in the river?

Q. At the end of the two hours there would be a flow of 13,000 second-feet in the river under the conditions I assume?

A. Yes. The locks would still be in operation.

2798 Q. And that would also be less than the average flow of the Kanawha River at Marmet, wouldn't it?

A. I don't know about that.

Q. You spoke something about the current below the locks at London and Marmet. Is it not a fact that the nature of those currents was determined by model tests made by Professor Thomas of Carnegie Institute of Technology?

A. I don't know.

By Mr. **Jackson**:

Q. Mr. Castle, what is the capacity in kilowatts of the installation at Marmet—about 15,000 kilowatts?

A. I have been told that, yes.

Q. I think you said your understanding is that the hydraulic capacity of the installation is 9,000 or 10,000 second-feet?

A. That is my understanding, yes.

Q. You testified about Exhibit 263, the letter of Col. Conklin to the Kanawha Valley Power Company, and I want to direct your attention to paragraph "C" with a subparagraph 1, at the bottom of page 2, reading as follows: "Pending completion of the central control system, current rules for manual operation will be modified at once with the view to minimizing fluctuations as follows:

"1. Power increment, both positive and negative, will be applied at the rate of 5,000 kw., applied gradually over a period of 60 minutes, instead of 30 minutes, as at present."

I ask you whether I am right in understanding that to mean that the rate at which the power load is to be added to the Marmet power plant, or taken off of the Marmet power plant, shall be 5,000 kw. per hour?

A. The paragraph you referred to states that it will be applied in increments, or taken off in increments.

By Mr. **Jackson**:

Q. I want to see if I am right in understanding that the load will be added or taken off at a rate which will be 5,000 kw.
2799 per hour, or not exceeding that?

A. Gradually applied.

Q. That is one-third of the capacity of the plant, isn't it—15,000 kw.?

A. That is my understanding, yes.

Q. And that would also be equivalent, speaking in terms of hydraulic capacity, to 3,000 second-feet per hour, would it not?

A. Assuming 9,000 second-feet.

Q. If you assume 10,000, it will be 3,300?

A. Yes.

Q. So under this rule of operation the flow of discharge of the Marmet power station may be increased 3,000 second-feet in an hour or decreased 3,000 second-feet in an hour; is that right?

A. That is correct.

Q. I also direct your attention to subparagraph 2 of Paragraph "C" at the end of Government Exhibit 263, reading: "Within the limits of +0.0 to −0.3 at the Marmet upper pool, the operation of Marmet plant will be started in advance of the London plant and closed in conjunction with the London Plant to equalize, as much as possible, the level of the lower pool at Marmet. Compensation of the heavier peak for shorter duration with incidental fluctuations will be carried primarily at London but in this operation due care will be exercised at both plants to avoid drawing the lower pool at London below normal." The lower pool at London is the Marmet pool?

A. That is the upper end of the Marmet pool.

Q. And by this reference to peak is meant a variable operation of the plant, isn't it?

A. Peak, as I understand it, is the maximum—either discharge in water or generation of power.

Q. It says "heavier peak for shorter duration." That means you would have a larger flow for part of the time; is that right?

2800 A. During the length of the peak, yes.

By Mr. Jackson:

Q. And this exhibit 263, you have identified, as I understand it, as the regulations that were promulgated by Col. Conklin and that now obtain; is that right?

A. Tentatively; yes, sir.

Redirect examination by Mr. Gatchell:

Q. Counsel asked you if you knew what velocities would result from the discharge at a certain number of cubic feet. You said you didn't know. Do you know that the Kanawha River would have different velocities at different stages?

A. At certain points, yes.

Q. Counsel asked you about sparring out of boats and may I ask you this: Do navigators wait until boats have gone aground before changing their spars when the river is falling?

A. No; when they know the river is falling they will watch pretty closely and they will try to get the boats moved out just ahead of the time they ground.

Q. So that the river might stop falling after they had sparred out; and they still would have gone through the operation?

A. That is correct, yes, sir.

Q. You said that private interests maintained the landings and harbors along the Kanawha River. Who maintains the water level?

A. The Engineer Department of the United States.

Q. Do private interests maintain landing places all up and down Kanawha River where they can tie up in fog?

A. Not to my knowledge.

Q. This agreement that counsel referred to as Exhibit #263, the letter signed by Col. Conklin, under date of June 26, 1936—is that a final agreement?

By Mr. JACKSON. I object to the competency of the witness to answer that question.

By the COURT. He has said two or three times it was a tentative agreement.

2801 By Mr. GATCHELL:

Q. By that do you mean it can be changed at any time?

A. Yes, sir.

Recross-examination by Mr. JACKSON:

Q. Mr. Castle, after the four new dams are completed and in operation and the three power stations, the two at London and Marmet and the one at Winfield, will the navigation interests be better off than under the old conditions with the ten low dams in the Kanawha River before any of these improvements were made?

By Mr. GATCHELL: That is certainly not a proper question. There are many considerations that might enter into it.

By the COURT. Objection sustained.

By the COURT:

Q. Mr. Castle, supposing the gates of the Marmet dam are raised as high as possible, in an effort to discharge water from the pool, what is the discharge that will occur when the pool is full? I realize that if the pool level drops, of course the discharge will be less but on a full pool if you raise the gates as high as possible, how much water will run out, do you know?

A. You mean the roller gates in the dam?

Q. Yes; the roller gates in the dam?

A. Well, I have no way of being able to answer that, sir.

2802 HARRY R. BRIGHT

Direct examination by Mr. GATCHELL:

Q. Will you state your full name and present occupation?

A. Harry R. Bright. Lock Master at Lock and Dam #6, Kanawha River.

Q. How long have you been Lock Master at Lock and Dam #6?

A. Nearly 7 years.

Q. How long have you lived on the Kanawha River?

A. All my life.

Q. Is the dam at Lock #6 a fixed crest dam?

A. It is a movable dam, Chanoine Wickets.

Q. And what is the normal pool elevation at Dam #6?

A. 563.15.

Q. What is the gage height?

A. 15.25.

Q. Are you in control of the pool level?

A. Yes, sir.

Q. And at what elevation are you instructed to keep that pool?

A. Got to keep it above normal pool, not to be under normal pool.

Q. At what stage of the river do you raise your wickets?

A. When our dam is down we start raising our wickets at about 11 feet on the lower gage.

Q. And what would be the reading on the Kanawha Falls gage at that time?

A. Between 4½ and 5 feet.

Q. At what stage on your lower miter-sill gage do you have your entire dam up?

A. Near about 7 feet, that is at low water.

Q. Would it be needled?

A. It would be needled.

2803 Q. In times of low water during the years prior to completion of the London and Marmet power plants, how frequently did you ordinarily operate or maneuver the wickets on Dam #6?

A. Near about 200 times during low water season.

By Mr. GATCHELL:

Q. Is that since the completion?

A. Since the completion of the Marmet dam.

Q. How about prior to completion of those dams?

A. It would be very few—six, maybe eight—times a year on an average at low water.

Q. How many times do you operate the wickets on your dams a day?

A. Average about four times a day.

Q. Are you informed as to the discharge past the Marmet dam?

A. By telephone.

Q. Who informs you?

A. The Lock Master or some of his crew who is in charge at the time. The Lock Master may not be there at all times.

By Mr. **Jackson**:

Q. The Lock Master where?

A. At Marmet.

By Mr. **Gatchell**:

Q. Do they notify you whenever there is a change in the discharge?

A. Yes; the same thing.

Q. How many men does it take to operate the wickets in ordinary low water under present circumstances?

A. Three.

Q. A three-man crew?

A. A three-man crew, yes.

Q. About how long does it take?

A. It takes about an hour or a little better than an hour for each operation.

Q. And what is the effect upon the normal current below the dam and near the lock entrance when you lower some of your wickets?

A. It sets up a back-slash, we call it, and the boats has difficulty getting in the lock. They have to put out a line to take them into the lock. It is an out-set current.

By Mr. **Jackson**. May it be understood that all of this testimony is subject to our objection as not proper rebuttal?

By the **Court**. Yes.

By Mr. **Jackson**. And exception.

2804 By Mr. **Gatchell**:

Q. Are complaints made to you when navigators have difficulty near Dam #6?

A. Yes, sir.

Q. Do you make investigation of such complaints?

A. Yes; I try to remedy that by our pool level.

By Mr. **Jackson**. I think another question should be asked if he is going to pursue this further.

By Mr. **Gatchell**:

Q. What do you do?

By Mr. **Jackson**. I object to their going into this question further. It seems to me it is new.

By the **Court**. I think so, too. I allowed these other questions to be asked on the theory that they were preliminary, getting to something probably in rebuttal of the evidence introduced by the defense, but these questions certainly are not in rebuttal.

By Mr. **Gatchell**. Your Honor, all that we are attempting to do by this witness, whose testimony on direct will be very short, is to see if Major Putnam was correct when he said that the rate of ge, increase or decrease in the flow of the river past the Marlam, would have no effect upon navigation, adverse or other-

the Court. Let us get to that then.

Mr. Gatchell. These questions that I have been asking are minary to that because we want to show that this man has ledge of what happens and how it happens and what naviga- interests have to say about it.

Mr. Jackson. That would be an effort to bring in further mony on the line of Capt. Elsey and would be improper.

Mr. Gatchell. May I proceed?

the Court. You may go ahead.

By Mr. Gatchell:

Did you answer the question as to what you did when they plained to you about navigation difficulties?

I investigate it.

Mr. Jackson. May our exception be noted?

the Court. He investigates and that is all.

By Mr. Gatchell:

Go ahead.

the Court. No; that is enough. He investigates it.

By Mr. Gatchell:

Do you operate your pool in any way?

Yes; if our pools are down we immediately caulk and try aise the pool and if we haven't got the water sufficient we call Mr. Marshall and ask for water if he has it to spare.

By the Court:

Mr. Marshall is the Lock Master at Marmet, isn't he?

That is right; yes, sir.

By Mr. Gatchell:

Does he give you the water?

At times.

If he does not what do you do?

I call Mr. Carpenter.

And what does he do, if you know?

He investigates it, as far as I know. That is as far as I vith it.

Have your navigation difficulties increased since the comple- and the operation of the London and Marmet plants?

By Mr. Jackson. I object to that as not proper rebuttal.

By the Court. He may answer it.

By Mr. Jackson. May our exception be noted?

Yes.

By Mr. **Gatchell**:

Q. If your dam has all of the wickets down and you receive word from the Marmet dam that the power plant has been shut down, what operation of your dam is necessary?

A. Well, if it down just below 11 feet, we have to put the dam up to the project depth above.

2805 By Mr. **Jackson**. Will you read the answer.

(The answer was read as above.)

By Mr. **Jackson**:

Q. Is that what you said?

A. Put the dam up to raise the pool so that navigators can go up and down the river.

By Mr. **Gatchell**:

Q. Do the changes in stage at the upper end of your pool cause any difficulty in the operation of your dam?

A. Changes in the pool? Yes; it does.

Q. Does it cause you to operate your wickets more frequently?

A. Yes, sir.

Q. Does the rate of increase in flow at the upper end of your pool cause you to operate your dam more frequently.

A. Yes, sir.

By Mr. **Jackson**. I object to that question as he hasn't shown any competency to consider rates of increase.

By the **Court**. The answer may stand.

By Mr. **Gatchell**:

Q. And would the same thing be true of the rate of decrease?

A. It would.

Q. You say you have lived on Kanawha River all your life?

A. Yes, sir.

Q. Can you stand on the bank of Kanawha River and observe a rise in that river of as little as 5/10 of a foot in five hours?

A. Well, yes.

Q. Do you have any difficulty in observing the rise in stage of the Kanawha River?

A. I do.

Q. Where were you living in 1930?

A. Lock #6.

Q. And where was your home?

A. Lock #6.

Q. Where is that located?

A. Four miles below Charleston.

Q. Where was the water supply of the City of Charleston obtained during that year, if you know?

A. Elk River.

2806 Q. Do you know if they experienced any difficulty with the water supply during that year?

By Mr. JACKSON. I object to that as irrelevant and immaterial.

By the COURT. What is that in rebuttal of?

By Mr. GATCHELL. This just goes to the testimony of Dr. Mead with respect to the City water supply of the City of Charleston and this witness was there during the year 1930.

By Mr. JACKSON. What is it going to rebut?

By the COURT. What statement did he make that you wish to deny?

By Mr. GATCHELL. It is in rebuttal of this specific point that was brought out by the witnesses for the defendant, namely: Dr. Mead, and I forget the other witness, that the water supply for the City of Charleston did not come from the Kanawha River, and, if this witness knows, I would like to ask him three questions on it.

By the COURT. He just said it came from the Elk River.

By Mr. GATCHELL:

Q. Is that true during the entire year?

By Mr. JACKSON: I object to that as not proper rebuttal.

By the COURT. I will let him answer.

A. They had trouble with water. They had to lay an extra line through the City of Charleston to the river to supply the water.

By Mr. GATCHELL:

Q. To what river?

A. Kanawha River.

Q. Do you know at what time they got the water supply from the Kanawha River?

A. No, sir.

Cross-examination by Mr. JACKSON:

Q. What do you mean by a rate of decrease in stage?

A. That is when the river is falling.

Q. You don't mean by rate——

A. (Interrupting.) We don't get it by rate—we get it by tenths.

Q. You don't know what a rate of decrease of increase means, do you?

A. Decrease is falling and an increase is rising.

Q. Any answer that you made that involved the questions of rate were made without any understanding on your part as to what that means, weren't they?

A. I don't know what rating is.

Q. Am I right in understanding you, Mr. Bright, that you can stand along the Kanawha River and, if that river is falling at the rate of 1/60 of an inch a minute, that you can stand there and observe that fall?

By the WITNESS. (Interrupting.) No, sir; I cannot.

By Mr. JACKSON:

Q. Mr. Bright, assuming that you are standing on the bank of the Kanawha River, I will ask you if you can observe an increase in the stage of the Kanawha River at the rate of 1/60 of an inch or less, in a minute?

A. Yes, sir; I can tell when the river is rising.

Q. You can actually see it rising?

2807 A. No, sir; but I can tell that it is rising by the different currents the same as if a man poured water there and made a current.

Q. If there is a change in stage upward, as little as 1/60 of an inch in a minute, you can observe the changes in the river, as you look at it. Is that right?

A. I can tell when the river is rising; that is all.

Q. You can tell when the river is rising with that small change?

A. You can tell when the river is rising.

Q. Suppose that you were standing on the bank of the Kanawha River and look at it and went away and came back in five minutes, and it had risen 1/16 of an inch, could you tell it from looking at the river?

A. We can tell when the river is rising, but I don't know how much.

Q. If you were standing there and then went away and came back in five minutes, it is your testimony that, in that interim, the river had—if the river had increased or risen—the stage had risen 1/16 of an inch, that you could recognize that with your eye?

A. I could not recognize it as 1/16, but I could recognize that it is rising.

Q. It is your testimony that, if you were standing on the bank of the Kanawha River and looked at it and went away and came back in five minutes, and there had been a rise in stage of as little as 1/16 of an inch, you could look at the river and say, "I can tell by the currents on the river that the river has risen since I was here."

A. I can tell that it is rising, but not that it was 1/16 of an inch.

Q. I just wanted to know how finely drawn your judgment was. You stated that you have operated the wickets at Number 6 Dam from time to time?

A. Yes, sir.

2808 Q. And you said that you now operate them perhaps 200 times a year?

A. Yes; approximately 200 times a year.

Q. You don't mean to imply that you operate all of them, do you?

A. No, sir; just to take care of the waves from the Marmet turbines.

Q. What you mean is that you adjust a few wickets during this time?

A. If we kept the dam up and the waves come when we have too much water over the top to swing the wickets, it would probably do damage to the dam.

Q. The point is, what you do under these circumstances is to adjust a few wickets. You don't put the wickets all down?

A. No, sir; we don't put them all down.

Q. It is perhaps only a few that you moved?

A. Yes, sir.

Q. And it is part of your duties, as lock-master, with your crew, to move the wickets, as may be required?

A. Yes, sir.

Q. You are directed to do that by Colonel Conklin, or through him?

A. Yes, sir; through him.

Q. Has your pay been increased since you have been moving or adjusting the wickets oftener?

A. No, sir.

Q. You get the same pay that you got for a number of years back, don't you?

A. Yes, sir.

Q. Have you any more men working for you now than you had?

A. The same men.

Q. The same men exactly?

A. Yes, sir.

2809 Q. You understand that your dam is to be taken out as soon as Winfield is completed?

A. Yes, sir.

Q. And there will not be any wicket dams then, I take it?

A. Not at Lock No. 6.

Q. Do you know how much volume of water must flow past your dam before currents, that are troublesome or an obstruction to navigation, arise?

A. No, sir.

Q. You have not made a study of that kind?

A. No, sir.

Q. And you would not have any idea that a flow of 2,000 second-feet or 6,000 second-feet, or 8,000 second-feet, or 10,000 second-feet would create these currents?

A. I don't know a thing about it.

Q. Nor any other measure of volume of water, such as acre feet or gallons or any thing of that character?

A. No, sir.

2810 Direct examination by Mr. GATCHELL:

Q. Will you state your full name and present occupation?

A. W. H. Marshall; I am lock-master at Marmet.

Q. And what are your duties as lock-master?

A. To control the upper pools at Marmet Dam.

Q. What is the elevation of upper Marmet pool at its working elevation?

A. The elevation is 589.9,—0.1 below the crest of the dam.

Q. Do the rollers constitute the crest of that dam?

A. Yes, sir.

Q. When the water falls below the working pool elevation, how much of a drop do you permit before you take any steps to remedy that?

A. If it goes below that one-tenth, which is below the crest, we try to rectify it and bring it back up.

Q. If it goes below 589.9?

A. If it goes one-tenth below 589.9, we try to bring it back.

Q. What do you do?

A. We call the operator that operates the power turbines and ask them if they won't restore it.

Q. And how can they restore it?

A. They could restore it by decreasing the opening through the turbines.

Q. They can restore it by decreasing the opening through the turbines?

A. Yes, sir.

By the COURT:

Q. You call the operator at Marmet, do you?

A. Yes, sir.

Q. And this pool will be brought back to the proper level by the inflow from London?

A. Yes, sir; by decreasing the discharge through the turbine.

2811 Q. By decreasing the discharge through the turbines at Marmet?

A. Yes, sir.

Q. And then that inflow from both will build it up?

A. Yes, sir.

2812 By Mr. Gatchell:

Q. Does the working pool elevation vary more than .3 of a foot?

A. It does; yes, sir.

Q. What are your instructions in regard to any variation?

A. We are instructed not to let the water go over the dam, if, by ordinary manipulation, the dam will prevent it.

Q. The manipulation of the power plant?

A. The manipulation of the power plant or Marmet Dam.

Q. Does the power company always respond to your request to change the discharge through their turbines?

A. Usually they do; however, once or twice, they would not do it.

Q. What happened the times they would not do it?

A. The operator told me that he had instructions from the Cabin Creek Station that he could not change it.

Q. What did you do?

A. In one case, I called the Cabin Creek Station and they told me—I asked them if they would not decrease their discharge through the turbines, so as to build the pool up, and he told me it was not any of my business, so I called up Mr. McCormack, but he was out of town, and that is as far as it went.

By Mr. Gatchell:

Q. Major Putnam said that there would be no adverse effect on navigation, if the rate of increase of the stage of Marmet pool did not exceed 1½ feet per hour up to the point where the critical discharge of 22,000 second feet obtained. When there is an increase in the stage of Marmet pool of 1½ feet per hour, what do you do?

A. Why, we get prepared to operate the roller dam and operate it as that water gets to it.

Q. And do you know if a rise of water at any such stage as that has interfered with navigation operating on the Marmet pool?

2813 A. The upper three miles of our pool—Marmet pool, is worse—it is the worst part, and navigators have complained to me that they had considerable trouble.

By the Court:

Q. What is the cause of it?

A. The increase or excess currents.

Q. At various times, under certain conditions?

A. Well, low water when we have just project depth, they have some treacherous chutes through there—narrow channels, and the additional discharge down there—they complained that it was objectionable.

By Mr. GATCHELL:

Q. Major Putnam said that a decrease in the stage at the head of Marmet pool for not more than two hours at a rate not to exceed 1½ feet an hour would not have any effect on navigation, adverse or otherwise, as long as the project level was maintained. Can you tell us what effect you have observed upon navigation in the Marmet pool, where the elevation—in decrease—where the elevation of the project pool was not—where the normal pool elevation was not reached?

By Mr. JACKSON. That is not an accurate quotation of Major Putnam's statement. The answer was this: (Referring to record and reading:)

"A. The rate of change in stage would have no effect on navigation, adverse or otherwise, except the necessary adjustments to lines and spars where boats are tied up at the terminals, so long as this rate did not continue to a point where the pool was no longer maintained at its project elevation."

By Mr. GATCHELL:

Q. What would you say about that?

A. The lock-master at London lock has received complaint that I have heard about.

2814 Q. Did you have any such yourself?

A. No, sir; I did not observe the conditions.

Q. Do you report all complaints to Mr. Carpenter?

A. All that I do not have authority to correct.

Q. Do you keep a record of complaints?

A. No, sir.

Q. Have you received any complaints regarding boats tied up at tipples?

A. Yes, sir.

Q. What is the nature of those?

A. Below Marmet Dam or Lock 6 pool, about four miles below Marmet, there is a coal tipple that has made several complaints of the lowering of the pool.

A. Boats going aground due to a falling river or lowering the stage at that point.

Q. Do you know if any such groundings were caused by fluctuations from Marmet and London power plant operations?

A. The Marmet——

By Mr. JACKSON (interrupting.) From his own observation?

By Mr. GATCHELL. I asked him if he knew.

A. I know that the lower pool at Marmet Dam fluctuated due to the operation of the hydro plant and, since this point is about four miles below, it is evidently the cause of their grounding.

Q. Did you receive many complaints or do you?

A. Yes; I did only recently. ..I might add that, since then, we ported to the men that complained that we have no jurisdiction er the control of this pool, and rather than report to me, they to my superiors.

By Mr. JACKSON:

Q. You say "we"; where?

A. At Marmet.

Q. You refer to pool No. 6?

A. Yes, sir.

By Mr. GATCHELL. You may cross examine him.

By Mr. JACKSON. I move to strike the evidence of this itness before the cross examination on the ground that it is not oper rebuttal evidence.

By the COURT. I will strike it all except the latter part—that knows that fluctuations were caused in pool No. 6 by discharges om the Marmet power plant and caused one grounding.

By Mr. JACKSON. That is pool No. 6?

By the COURT. Yes, sir.

Cross-examination by Mr. JACKSON:

Q. How old are you?

A. I am 34 years old.

Q. How long have you been working for the Government?

A. Since 1929.

Q. You have been working there as lock-master for that period?

A. For the last two years.

Q. Before that, what was the nature of your work?

A. I was inspector of construction at the lock and dam.

Q. Before you went with the Government, where did you work?

A. I worked on surveys.

Q. Surveys on the river?

A. Yes, sir.

Q. For whom?

A. For the Government.

Q. You worked for the Government before 1929, did you?

A. No, sir; that was since then.

Q. What did you do before 1929?

A. I worked for the Commissioners of Sewerage at Louisville, Kentucky—a survey man.

Q. Do you have any written instructions from your superiors s to the operation of Marmet lock?

A. Yes, sir.

Q. Do you have them here with you?

A. No, sir.

Q. Do you have them here in the city?

A. No, sir.

Q. Can you have them sent here tomorrow?

A. I could write for them.

Q. Where would you have to send?

A. To Marmet Dam, at Marmet, West Virginia.

Q. Now, does the water ever flow over the roller gates at Marmet?

A. Yes, sir.

Q. It does that from time to time, does it?

A. Yes, sir.

Q. And at times it flows over the gates to a total of several tenths of a foot?

A. It has gone 0.2, I know.

Q. Hasn't it run higher than that at times?

A. I don't recall.

2816 Q. You have a gage there, haven't you?

A. Yes, sir.

Q. Is that an ordinary recording gage?

A. No, sir; it is a staff gage.

Q. You read it every hour?

A. Yes, sir; every hour.

Q. There is also an automatic recording gage, isn't there?

A. There is not on our property.

Q. But there is at the dam, isn't there?

A. The hydro plant, I understand, has one working.

Q. And that records the fluctuations in stage more accurately than a staff gage, read once an hour?

A. Yes, sir; it should if it is working properly.

Q. It does away with both the fact that the reading is intermittent of the staff gage and also does away with any possible errors in reading?

A. Yes, sir.

Q. The occasional overtopping of the gates is not merely a splash or spill, but it is an actual overflowing?

A. Yes, sir.

Q. Is there some question involved of flowage rights, if the water gets much over the top of the gates?

A. When the water goes over the top of the gates, it is due to mismanagement or fluctuations, but we attempt to keep it below and operate in normal times to keep the water below the top or at the top.

Q. But every once in a while, it does get over?

A. Due to mismanagement, I suppose.

Q. Would you say that it had been over the gates as often as 32 times in the month of July, by not less than 0.1 of a foot?

A. Well, it might have done that; it might have done that.

2817 Q. You testified about a complaint at a landing in pool No. 6; is that right?

A. Yes, sir.

Q. What landing was that?

A. That was the Hatfield-Campbell Creek Coal Company.

Q. Do you know what depth of water prevails in the landing r the harbor of the Hatfield-Campbell Creek Coal Company.

A. No, sir.

Q. Do you know to what depth the barges were loaded at the ime of the alleged grounding, if any?

A. No, sir.

Q. You know it to be a fact that Pool No. 6 was above the normal ool level at the time of the alleged grounding?

A. Yes, sir; it was.

Q. Isn't it a fact that, since Marmet Power Station has been in operation, the elevation of pool No. 6 below your dam has never een below the project elevation?

A. That is true.

Q. Mr. Castle testified here that, in accordance with a certain etter offered in evidence by the Government, in Exhibit 263, written by Colonel Conklin, there was permitted an increase in discharge of the Marmet Power Station at the rate of 3,000 second feet in an hour. Can you tell me how much an increase in discharge of 3,000 second feet in an hour would raise the elevation of the water at the tail race below Marmet Dam or at the upper end of Pool 6?

A. I have no knowledge of the discharge in second feet through Marmet Dam. We always tell in vertical heights.

Q. At Marmet Power Station?

A. Marmet Station.

Q. Don't you know that the full discharge or capacity discharge of the Marmet Power Station, that is, 9,000 or 10,000 second
2818 feet would increase the water elevation in the tail race below Marmet Dam and at the head of Pool No. 6 by about three feet?

A. Possibly, I don't know.

Q. Haven't you observed that?

A. That is, with the power company's turbines running wide open?

By Mr. **Jackson**:

Q. Yes, sir, and nothing through the dam?

A. Possibly three feet.

Q. And wouldn't it be true that an increase in discharge of 3,000 second feet an hour would raise it approximately one foot per hour?

A. Something near that.

Q. Now, you said that an increase in stage of 1½ feet an hour that you would prepare to operate the roller gates?

A. Yes, sir; we would be prepared.

Q. The roller gates are operated by electricity, are they?

A. Yes, sir.

Q. And to operate them, you press a button and they raise?

A. Yes, sir.

Q. And the reason you would prepare to open them, would be so that you would let the water go over the crest of the dam, rather than spilling over the roller gates?

A. It would go out under the dam instead of over the crest.

Q. I thought it would go under the roller gates, but over the crest of the dam?

A. No, sir; it does not go over the crest of the dam, because we raise the rollers so the water will go under the rollers.

Q. The dam is a masonry dam, with the roller gates on top?

A. Yes, sir.

Q. And the roller gates simply increase the height of the dam or the masonry part of the dam?

A. Of the masonry part; yes, sir.

Q. And when you raise the roller gates, the water passes under them and over the masonry part of the dam?

2819 A. It passes over the sill of the dam, the sill; yes, sir.

By the **Court**:

Q. What about the sill—how high is the sill referred to from the bottom of the gate, or the bottom of the river?

A. The elevation of the sill is 564 and the elevation of the apron below the dam is 550; it would be about 14 feet.

By **Mr. Jackson**:

Q. If there is more water needed in pool No. 6, and the power station were not operating, you would have to raise the roller gates?

A. If we had the water, we would.

Q. Isn't it a fact that you didn't operate the roller gates but once in August?

A. In August, I believe that is right; it would not be over two times, I don't think.

Q. Isn't it a fact that you only operated it once on August 15th, for 13 minutes and you raised it about 3 inches?

A. I think that is right and I saw that—I was looking at it.

Q. Wasn't that operation because the water was over-topping the gates?

A. Yes, sir; that is right.

Q. Did you operate the gates more than two or three times in July?

A. I don't recall the number of times.

Q. You testified that at one time you asked some operater to djust the discharge and he refused?

A. Yes, sir.

Q. State when that was.

A. I don't recall the date; however, the operator, or the man ext to him, in responsibility, would know, because I talked to all of them about it.

820 Q. Who wes it you asked?

A. I tried to find out about that, but I could not find out bout it. He is stationed at Cabin Creek.

Q. I thought you asked the operator at Marmet to change?

A. I did.

Q. Who was that?

A. The operator, was named, I believe, Smith.

Q. Do you know when that was?

A. I don't recall the date.

Q. Was there any other occasion when you asked the operator o change the discharge?

A. One other time I asked him and he said he could not do it.

Q. When was it?

A. In the last two months. I don't know the date.

Q. Who was it you asked?

A. The operator on duty at the time. That was one of the easons we raised the roller sufficiently.

Q. What was the date?

A. I don't recall the date.

Q. How long ago was that?

A. It has been about two months, I will say.

Q. Isn't it a fact that you did not raise the rollers on any lates, except within the last three months—except July 6th, July 8th, and July 13th, and August 15th?

A. I don't know the dates. I will have to look at the records.

Q. Can you fix a date when you claim these conversations occurred?

A. No, sir.

Q. Do you live at Marmet Lock and Dam?

A. Yes, sir.

Q. Does the operator at the station—the power station work there?

A. He works at the Marmet Hydro plant.

2821 Q. And you don't know who they were?

A. I know Smith and I know one or two of them.

Q. Do you know who you were talking to on the second occasion?

A. No, sir.

Q. Can you refer to your records and tell us who it was?

A. No, sir; I don't have any record of that.

Q. Can you tell the date by looking at your records?

A. No, sir; I could probably guess when it was. It was one of three days that we operated the dam; it was one of those days.

Q. And you could only guess as to one of those days?

A. Yes, sir; Mr. McCormack was out of town at the time and you might trace it through that.

Q. Because he was out of town?

A. Yes, sir. I discussed it with him some time later.

Q. Why did you want the discharge changed?

A. I have instructions to do all I can to keep the water from going over the dam.

Q. And you wanted to increase it?

A. I wanted to increase it to draw it down.

Q. The pool was too high and you wanted more discharge?

A. Yes, sir.

Q. Was that the same situation on the other occasions?

A. The pool being high?

Q. Yes?

A. Yes.

Q. You could remedy that by pressing the button, couldn't you and raising the roller gates, or one of them?

A. Yes, sir.

Q. Why didn't you want to do that?

A. Instead of calling the hydro plant?

Q. Yes?

A. Because we wanted them to have as much water as they could get.

2822 Q. Then you were not offended that they didn't take it. It made no difference to you, did it?

A. No, sir; but they were supposed to do it. They were operating on a schedule and the operator at Marmet hydro plant said he could not change it without orders, and Cabin Creek Station told him to let it go as it was.

Q. So you then operated the roller gates?

A. Yes, sir.

Q. How many?

A. One.

Q. For how long?

A. For a very short time, 15 minutes, probably.

Q. Your trouble was remedied by opening the roller gates for 15 minutes?

A. For the time; yes, sir.

Q. How high did you open the gates?

A. I think about 6 inches, or 3 inches.

Q. What is the full opening of that gate?

A. About 50 feet.

Q. Is it that h'ight?

A. Yes, sir.

Q. Someone said it was 26.

A. The full opening of the gate?

Q. Yes?

A. You can raise the roller up 50 feet above the sill.

By the COURT. What is the diameter of the roller?

A. The diameter of the cylinder is 19 feet and 4 inches and it has a lip sticking down to take up the difference.

By Mr. JACKSON:

Q. You gave some testimony as to what would be the effect upon navigation in Marmet Pool which would result from
2823 a decrease in stage at the head of Marmet pool for not more than two hours at a rate not exceeding 1½ feet per hour. Now, assuming that the pool never fell below project level, what would be the effect on navigation in that pool, if any.

A. The lowering of the stage would affect it to a certain extent.

Q. If it was never lowered below project elevation, would it make any difference?

A. Yes, sir; if boats were not in the channel, it would make some difference.

Q. Your answer was based on the assumption that, if the boats were out of the channel, in the shallow part of the pool, the lowering might affect it?

A. No, sir; not affect them in the channel.

Q. How would it affect a boat in the channel at Marmet pool, if the stage never fell below project depth?

A. As I understand navigation—I am not a navigator, they will swing their tow boat around in order to keep a loaded tow in the channel, and by them having the tow boat out of the channel and the tow in the channel, they could easily have water drop in and they could hit an obstruction.

Q. Is it your testimony that the Government channel is not wide enough for navigation of a tow boat and the tow?

A. No, sir.

Q. (Continuing.) When it is full?

A. No, sir; I am not a navigator, but they complained.

Q. You hear lots of people complain about lots of things, don't you?

A. They do on that river.

Q. You had nothing to do with the design of the navigation channel, did you?

A. No, sir.

2824 Q. You don't mean to tell the Court that the navigation channel was so designed that that project, at normal elevation, is not suitable for navigation of a tow boat and tow, do you?

A. It is no doubt suitable; however, the operators are taking advantage of some of the conditions on the river and they may be mislead by the river falling—it may be dangerous.

Q. You are assuming in your answer that there is going to be a shortage of water because the boats are out of the channel.

A. Because the river is falling.

Q. If they are in the channel, you don't claim there is a shortage of water with project depth, do you?

A. No, sir; not in the channel.

Q. So you are answering upon the assumption that the boats are out of the channel?

A. They could be.

Q. That is the basis of your answer?

A. If part of them is out; yes, sir.

Q. Do you think a decrease of a foot and a half in stage would reduce the currents in Marmet pool or not?

A. It would do that to a certain extent, I believe; however, it is the falling water they have trouble with.

Q. Do you think the decrease of currents would be beneficial or otherwise?

A. The decrease in currents will usually be beneficial.

Q. I think you said that most of these troubles, so far as you heard about them, were at the upper end of the pool?

A. In the Marmet pool?

Q. Yes; I am talking about the Marmet pool, and that is where the old pool No. 3 was?

A. New No. 3?

2825 Q. No; old pool No. 3.

A. That is three miles below new Number 3.

Q. You mean that new No. 3 is London?

A. Yes, sir.

Q. Do you know that the elevation of old Pool No. 3 was 1.57 feet above the elevation of Marmet?

A. Yes, sir; approximately that; I don't remember the figures.

Q. And that old Dam No. 3 was taken out after the construction of Marmet pool, which dropped the water level up in that area by 1.57 feet?

A. Approximately; yes, sir.

Q. That drop was felt all through the shallow parts of the pool outside the channel and by landings that had been built, or were being maintained under the old conditions, wasn't it?

A. Yes, sir.

By Mr. **Jackson**. That is all.

By Mr. **Gatchell**. I may be laboring under a misapprehension. May I ask if Your Honor's ruling struck out the direct testimony.

By the **Court**. My ruling did not apply to all of the evidence of this witness, but that portion that you asked about the grounding and pool No. 6. I said it was all stricken except so far as the witness says it was of his own knowledge—that he knew of one grounding, and that they were from fluctuations caused by the discharge from power operations at Marmet.

By Mr. **Gatchell**:

Q. Where is the upper staff gage located at Marmet Dam?

A. It is located about 60 feet above the upper gate or the intermediate wall.

Q. Where is it located with respect to the power house—on the same bank?

A. It is on the opposite side of the river.

2826 Q. Where is the lower gage?

A. It is about 40 feet below the lower gates or intermediate wall.

Q. On which side of the river with respect to the power plant?

A. On the opposite side.

By the **Court**:

Q. Since you have been there at Marmet, has the river gotten so high that the flow could not be taken care of through the gates?

A. Yes, sir.

Q. Has it ever gone over the top of the dam?

A. We raise the dam out of the way. It has gone over the top wall, which is five-foot higher than the elevation of the crest of the dam.

Q. You raise your gates when the flow gets high?

A. Yes, sir.

Q. Has the flow in the river gotten so high, since you have been there, that it could not be taken care of through the raised gate?

A. Yes, sir; we would have no control over it; the rollers would be all out of the water.

By Mr. **Gatchell**. Q. Would it go over the roller gates when they were raised?

By the **Court**:

He raised the gates—he raised the rollers and the discharge comes from the opening made by the raised rollers.

A. Yes, sir.

Q. Has the water gotten so high, since you have been there, that the discharge could not be taken care of in that way alone, and went over the whole thing?

A. Possibly it did during the ice last winter when it broke up and came down so fast it might have gone over just a little bit. That was in the break of the gorge, and I think 2827 we had a raise in the lower pool of five feet an hour.

Q. These gates are in between sort of pillars in sections?

A. Yes, sir.

Q. And it is a permanent structure that goes clear to the top?

A. Yes, sir.

2828 **Thomas H. Graham**

Direct examination by Mr. Thompson:

Q. Mr. Graham, will you please state your name and residence?

A. My name is Thomas H. Graham.

Q. What is your occupation?

A. I am employed by United States Engineers at Huntington, West Virginia, as Assistant to the Chief of the Repair Section.

Q. Where is Wicket Dam No. 6 on the Kanawha located?

A. About five miles below Charleston, and it is the next wicket dam below the City of Charleston.

Q. Do you know where Elk River discharges into the Kanawha?

A. I do.

Q. Where?

A. In the City of Charleston.

Q. What is the normal elevation of the pool above Wicket Dam No. 6?

A. Elevation 563.15.

Q. How far up Elk River does pool No. 6 back the water?

A. About three and a half miles.

Q. State whether or not Wicket Dam No. 6 will be eliminated by the construction of the Winfield dam?

A. It will.

Q. What will be the normal elevation of the pool created by the Winfield dam?

A. Elevation 566 above mean sea level.

Q. How far, if you know, will the Winfield pool back the water up Elk Creek?

A. About eight miles.

Q. Have you made any investigation to ascertain the source, or sources, from which the City of Charleston obtains its water supply?

Mr. Jackson. I object as irrelevant and immaterial.

The Court. He may answer.

Mr. Jackson:

Exception.

A. I have.

2829 By Mr. Thompson:

Q. When?

A. Last month—August 31, 1936.

Q. Where does the City of Charleston obtain its water supply?

A. One plant is located on the west bank of the Elk River about one mile above the mouth of the river; the intake is in Elk River. Another plant is located on the left bank of the Kanawha River about 200 feet above the south side highway bridge; its intake is in the Kanawha River, and it is connected to the main plant by a water main running under the bed of the river. Another plant——

Mr. Jackson: (Interposing.) Did you say "plant?"

A. Pumping station. A pumping station is located on the right bank of the Elk River about four and a half miles above the mouth of the river. This station is connected to the main plant by a water main.

By Mr. Thompson:

Q. Now, you have named three or four there?

A. Three.

Q. Are there any others?

A. There are two more.

Q. Where are they?

A. One above the City of Charleston, at Belle, West Virginia, and another at Nitro, below Charleston. Both are on the right bank of the Kanawha River, and have their intakes in the Kanawha River. These two plants are connected by water main running through the City of Charleston, which connect with the City Water Works, so Charleston may obtain water from either of these plants.

Q. State, if you know, when the river is low (that is Elk River) where does the City of Charleston get its water from?

A. During very dry seasons, all, or practically all, of the water for the City of Charleston comes from the Kanawha River.

2830 By Mr. Thompson:

Q. How low does the Elk River get, if you know, in flow?

A. It has been down to one second-feet.

Q. Do you recall what year that was?

A. 1930.

Q. State whether or not these pumping stations have a connecting system?

A. They do.

2831 At this point the following Government Exhibits were introduced by Huston Thompson, Attorney for the Plaintiffs

Government's Exhibit No. 264–A—Aerial photographs of New River from Hinton, W. Va., to Narrows, Va.

Government's Exhibit No. 264–B—Aerial photographs of New River from Hinton, W. Va., to Narrows, Va.

Government's Exhibit No. 264–C—Aerial photographs of New River from Hinton, W. Va., to Narrows, Va.

The following stipulation was entered into by the Counsel regarding the above Exhibits:

By Mr. **Jackson**:

The waiver of objection to the admission of these Mosaic photographs produced is conditioned upon:

(1) Stipulation they were taken from a height of 10,000 feet or more;

(2) That all of the ink markings will be removed from the photographs, and

(3) That it is stipulated that the flow of the river at the time the pictures were taken ranged from 2,800 second-feet for a few of them, to 11,500 second-feet.

Is that agreed to?

By Mr. **Thompson**:

Yes, except I think the stipulation should be an average of 7,500 second-feet.

By Mr. **Jackson**:

All right.

By Mr. **Thompson**. May we put these in as they are, and we will secure similar pictures, identical pictures, and substitute in place of these?

By the **Court**. I think so.

By Mr. **Thompson**. Then we offer these in evidence as Government Exhibit Nos. 264–a–b–c. (Pictures were so marked by the reporter.)

By Mr. **Jackson**. Subject to the stipulation and understanding the lettering on these exhibits now actually in Court are not received, and the exhibits present will be replaced by identical photographs, without such lettering.

By Mr. **Thompson**. Yes, sir.

2832 **Roger B. McWhorter**, a witness hereto introduced by the United States, was recalled and testified as follows, on direct examination.

By Mr. **Thompson**. Q. Mr. McWhorter, on page 5261 of the record, Major Putnam states that in his opinion New River was not susceptible of navigation in its natural state; please state your opinion on this subject?

By Mr. Jackson. Objection to that as not proper rebuttal.

(Discussion by counsel.)

By Mr. Jackson. It seems to me the most they could ask would be they be permitted to ask the single question that was submitted to Major Putnam and Colonel Watkins, and for the witness to answer yes or no.

By Mr. Thompson. I will ask the question and give it exactly as it is here.

Q. Will you state whether or not, in your opinion, New River was susceptible of navigation in its natural state?

By Mr. Jackson. We want our exception noted because not proper rebuttal and not competent. The answer I understand is to be yes or no.

By Mr. Thompson. Your witness expressed a view that took one quarter of a page.

By Mr. Jackson. I asked the reasons. You could have done so on direct.

A. It is, for the reason (interrupted).

By Mr. Jackson. I object to him going any farther than giving his statement.

By the Court:

That is all. He has given his reasons before.

Q. Mr. McWhorter, your attention is called to page 5290 and
5291 of the record, whereon Major Putnam says, in substance, a
change in stage of five feet up or down at the rate of two feet
2833 per hour would not affect the mooring, loading and unloading of barges, the question reads:

"Q. What, if any, practical effect would an increase in stage, at a rate not to exceed two feet per hour, with a total rise in stage, not exceeding five feet, have upon the mooring, loading and unloading of barges or other vessels in harbors or at terminals along the Kanawha River.

"A. I understand there is a total limitation or another limit placed on the total amount of change and that is placed at five feet. That being the case, the only effect on navigation under those conditions would be that the barge men would have to keep their eyes open more actively so that on a decreasing stage their lines would not part, and on a rising stage they could take in their lines, and whichever direction the stage was going they could properly adjust any spars they used for keeping their barges off the banks.

"Q. You referred to rising and falling stages. I think I only asked about rising stages. Is your answer applicable to either rising or falling stages at the rate of two feet per hour with a maximum change of five feet?

"A. Yes, it is."

What do you have to say to that?

By Mr. Jackson. I object to the form of the question and also to the competency of the witness to answer. He has never shown any experience in navigating boats.

By the Court. I think he may answer it.

By Mr. Jackson. Exception noted.

A. It is my opinion that any such great change as that in the stages of the river would very seriously and adversely affect the interests of navigation. In fact, I think under no condition could navigation thrive under such conditions.

By Mr. Jackson. I move to strike that out. The conclusion that it would affect the interests of navigation is purely a conclusion of the witness.

By the Court. Is that all you want on that?

By Mr. Thompson. Yes, Your Honor. He made a statement and I want him to explain why.

By Mr. Jackson. Is our motion to strike rule on?

By the Court. I will let it stay. He may ask him.

By Mr. Jackson. May our exception be noted?

A. I was referring to those sudden and large changes in stage in a short period of time. The reason why that would affect navigation adversely is that boats could not be moored and sparred out and tied up and left for even as much as an hour or so without running the risk of having those boats break away from their moorings by the water being dropped from under them.

By Mr. Thompson:

Q. Mr. McWhorter, I have reference to page 5209 of Mr. Putnam's testimony. On that page Major Putnam states, in substance, that slack water navigation pools vary from 6 inches above and
below the predetermined stage at which the pool is supposed
2834 to be maintained. What is your opinion as to whether such
pools fluctuate in that manner?

A. They do not to my knowledge.

By Mr. Jackson. I object to the competency of the witness to answer.

A. (Continuing.) They do not, to my knowledge, and there is no reason for it to fluctuate to those wide limits. In fact, these navigation pools can be and are held very close to the project levels.

By Mr. Thompson:

Q. I hand you, marked for identification, Defendant's Exhibit No. 525, consisting of fourteen pages and on the heading "War

Department, Office of the Division Engineer, Upper Mississippi
Valley Division, Corps of Engineers, United States Army,"
2835 and dated St. Louis, Missouri, February 24, 1932, subject—
Report on Application for License, Federal Power Project
No. 1175, West Virginia, to the Chief of Engineers, U. S. Army, Washington, D. C., and ask you if you know what that is?

A. Yes, this is the report of the Division Engineer of the War Department at St. Louis, Missouri, who was the Commission's accredited field representative as to this project. This report was made pursuant to a request of the Federal Power Commission. It was made to the Chief of Engineers, and, pursuant thereto, the Chief of Engineers submitted his report to the Commission and this report of the Division Engineer I took from the Commission's files.

By Mr. **Thompson**:

Q. I call your attention to page 7 of that report, and ask you to read the 7th paragraph, entitled "Power Capacities."

A. "Power Capacities.—The average discharges of the Great Kanawha River for 90 percent of the time at Marmet and London were computed in office of the District Engineer, Huntington, West Virginia, from flow duration data based on 40 years of stream flow records at Lock #2, with proportional increases in flow due to increased drainage areas. To determine the net amount of water in second-feet available for power a deduction was made for water required for navigation lockages and for leakage through the lock, and crest gates. The resultant or residual flow remaining for power use for 90 percent of the time was found to be 2,660 second-feet at Marmet and 2,560 second-feet at London. This applies under present conditions of no storage in the basin. Using the formula for power capacity of h. p. = .08 q. h., where *q* is the 90 percent power flow and *h* is the average static head, the following table gives the flow values and power capacities to apply under the initial developments at Marmet and London.

"Stream flow 90 percent of time, second-feet, Marmet 2910, London 2800.

"Estimated available for power use, second-feet, Marmet, 2660, London 2560."

2836 Q. At that point will you subtract 2,660 from 2,910
under Marmet?

By Mr. **Jackson**. We will concede that 250 is the difference, but we object to the testimony. It isn't rebutting anything and he is reading from an exhibit in evidence.

By the **Court**. He is trying to show what the representative of the Chief of Engineers, or the engineer in the field, allowed for lockage.

By Mr. **Thompson.** Yes, sir.

By the **Court.** What is that in rebuttal of?

By Mr. **Thompson.** And to show that is the basis on which they figured the charges so far as operating those plants was concerned, and that that lockage of 250 second-feet is one which these people, the defendants, recognized, when they made their contract and it seems to me that rebuts any testimony that has been introduced here of some very minor low flow that is necessary for lockage.

By Mr. **Jackson.** Will that affect the quantity of water actually used for lockages?

By the **Court.** It only rebuts the answer of another engineer who says it is his opinion if I recollect correctly, from 150 to 200 second-feet, is sufficient for lockage.

By Mr. **Jackson.** That is right. He made an engineering estimate. At the same time, he said it was true when they were trying to arrive at some trade or deal for this power that they discussed 250 second-feet as the outside limit that might some time or other, over this long term contract, be required for lockage, leakage and evaporation, and this doesn't rebut anything that is in the record.

By Mr. **Thompson.** I call Your Honor's attention to page 6446 of Mr. Scheidenhelm's cross-examination:

"Q. Wasn't an allowance made there of 250 second-feet for lockage upon which you computed your figures for the rental?

(Mr. Jackson objected.)

"The **Court.** He may answer it.

"Mr. **Jackson.** I don't think there is anything in the license about it at all.

"Mr. **Thompson.** I understood the Court to say 'any dispute.'

"The **Court.** He can answer it unless there is some dispute about it and then we want the best evidence."

By the **Court.** Did he answer it?

By Mr. **Thompson.** "Mr. Jackson. It is not in the license, and I understand it is not a fact.

"By Mr. **Thompson.** Our contention is when they figured the basis of the license, in all of the figures there was an allowance of 250 second-feet for lockage. That is what I am asking this witness, if that isn't true?

"By the **Court.** You may answer.

"By Mr. **Jackson.** May our exception be noted."

By Mr. **Jackson.** Read the answer.

By Mr. **Thompson.** All right, I will read his answer, but you know how long his answers are: "There is, of course, no contractual arrangement in that respect at all. The fact is that when the economics of the problem were figured at the various offices of the War Department, particularly at the District Office, there was an allowance for leakage and lockage made in the total of 200 or 250 second-feet, I do not recall which, an allowance in the sense that their estimate of total flow, volume of flow or rate of flow at any given time were reduced by 200 or 250 second-feet so as to reach a figure which they felt surely would represent"——

By the COURT. You are rebutting that testimony by bringing in a paper to show what the witness said is correct?

By Mr. THOMPSON. No, I am bringing this in to show here is an actual basis of 250 second-feet. They don't admit it. He said "200 or 250". I am bringing this evidence in as the best evidence to show that fact and that they recognized it.

By the COURT. I permitted it to be answered by the witness and he answered it and I don't think there is anything in this that is a denial of it at all.

By Mr. THOMPSON. The thing isn't settled by the answer of Mr. Scheidenhelm. It is in his usual language where he leaves a thing up in the air. Will Your Honor permit him to answer it?

By the COURT. I will permit him to say 250 feet, that it shows in the engineer's report that it was figured on the basis of 250 feet.

A. Your Honor, it shows more than that.

By Mr. JACKSON. I object to the witness—he doesn't want to wait for a question to start the argument.

By the COURT:

Q. What do you mean—it shows more than that?

A. It shows that Col. Scheidenhelm said that was the correct figure.

Q. The engineers' report doesn't show what Col. Scheidenhelm said?

A. No, but Col. Scheidenhelm submitted a memorandum commenting on that report in which he did make that statement.

By Mr. JACKSON. I object to the last statement and move to strike it out.

By Mr. THOMPSON. May I ask Counsel have you introduced a report from Mr. Scheidenhelm or Col. Scheidenhelm on the Kanawha Valley Power Company. I don't want to mark this for indentification if you have.

By Mr. JACKSON. No, I am sure we haven't introduced anything as irrelevant as that.

By Mr. THOMPSON:

Q. I hand you, marked for identification, Government Exhibit #266, being dated March 12, 1932, and in type form with the name of F. W. Scheidenhelm at the end, and being an informal comment upon the report of the United States Division Engineer at St. Louis, February 24, 1932, on an application of the Kanawha Valley Power Company for license, Federal Power Project No. 1175, West Virginia, by F. W. Scheidenhelm, Consulting Engineer for Applicant, and ask you if you know what that is?

A. I do.

Q. Where did that come from?

A. From the files of the Federal Power Commission.

Q. Were you in the Federal Power Commission at the time that was received?

A. I was.

Q. Do you remember it being received there?

A. I do.

By Mr. Thompson. I offer this document in evidence.

By Mr. Jackson. We object to it as not proper rebuttal and irrelevant and immaterial.

By the Court. It may be a paper over Col. Scheidenhelm's signature that is contradictory of something he said.

By Mr. Jackson. They can't do that without submitting it to him on the stand. I don't think one can lay in the bushes.

By the Court. I was not thinking of that feature of it. Let me see what it is.

By Mr. Thompson. Your Honor will understand we have just introduced this document before which set up the figures of the Chief of Engineers and here is a comment by Mr. Scheidenhelm: "Par. 7. Power Capacity. In view of the estimates of flow and of the requirements for lockages and leakage as estimated by the Division Engineer, the derived figures in horse power appear to be correct."

By the Court. I don't think that is contradictory of anything.

By Mr. Thompson. I think it is supporting. I want to make definite now what Mr. Scheidenhelm, as I say, has left up in the air, that is, this 250 second-feet.

By Mr. Jackson. I object to the exhibit as not proper rebuttal.

By the Court. Let it stay in.

By Mr. Jackson. Exception noted.

2837 By Mr. Thompson. Q. On page 5770: "Q. Now assuming that for some reason the three-foot draw down between elevations 611 and 614 in the case of the London Pondage would not be available for reregulating any Radford power tides which might pass Kanawha Falls, and that no reregulation of these tides had been accomplished in any pond or reservoir upstream from the head of the London Pool, and assuming the Winfield and Gallipolis dams to have been completed and placed in operation. What, in your opinion, or rather what is your opinion as to whether any Radford Power tide passing Kanawha Falls, would be transmitted unchanged through the Kanawha navigation pools into the Ohio River, downstream from the Gallipolis dam? A. I think it is improbable that these waves would be transmitted down those navigation dams. The surface area is very large, so large that variation in water level of about two inches in those pools would be sufficient to reregulate the power waves from the Radford plant." I will stop long enough to ask the witness if he agrees with that statement?

By Mr. Jackson. I object to that as not a proper method of rebuttal. We go through a record and read every question and answer and ask the witness if he agrees with it.

By Mr. Thompson. We are not reading one in a hundred. We are reading inconsistent statements.

By the Court. It is expected that the witness will testify to the contrary?

By Mr. Thompson. He will testify to the contrary of that, absolutely. Then we will turn back, as soon as he gets through with that, to the next one and read the two that Your Honor has ruled out, and show there is an absolute inconsistency on the part of this witness.

By Mr. Jackson. Won't that appear in the record?

By the Court. I will let him answer this question. I don't think the proper way to ask the witness a question is to ask him if he agrees with it. The question ought to be more specific.

By Mr. Thompson:

Q. What do you have to say about it?

By Mr. Jackson. I object to that as worse.

By the Court. It is right difficult to frame a specific question and embody those conditions. I will let him answer it.

A. If the London pool were held at its maximum level of 614, the power waves reaching that pool from the Radford project would be transmitted practically unchanged through that pool, the Marmet pool, the Winfield pool and the Gallipolis pool, into the Ohio River, below the Gallipolis pool, and, in fact, they might reach the Ohio River below the Gallipolis dam as larger waves than they were when they reached the London pool for the reason that those pools are just as likely to be above the project level as they are below, and if they are above, these Radford waves would entrain that extra water and carry it on down to the Ohio River below the Gallipolis dam and thus cause larger waves than the Radford waves were at the London pool. Likewise, if the several pools on the Kanawha River, and the Gallipolis pool on the Ohio River should be below the project level, that would aggravate the condition of the long troughs that would be formed over the week ends, or for longer periods, that the Radford project might be closed down.

2838 By Mr. Thompson:

Q. I hand you, for identification, Government Exhibit No. 267, being a letter from John J. Kingman, Lt. Col. Corps of Engineers, and Chairman of the Federal Power Commission, Interior Department Building, Washington, D. C., dated September 17, 1932, and ask you if you know what that is?

A. That is a letter from Lt. Col. John J. Kingman, for the Chief of Engineers, dated September 17, 1932, in response to a telephone request from the office of the Federal Power Commission.

By Mr. Thompson. Q. Mr. McWhorter, I call your attention to the testimony of page 6283 on direct of Col. Scheidenhelm, wherein it says, in substance, that the fluctuations in flow caused by the London and Marmet power plants are so much greater than the power waves that would be caused by the Radford plant, that the Radford waves would not be recognizable below the London dam. State whether or not, in your opinion, that is a true statement?

By Mr. Jackson. I object to that as not proper rebuttal. He is reading an answer to the witness and asking him if it is a true statement.

By the Court. I think he may answer that. I don't know whether that was gone into in chief or not.

A. That is not a correct statement, if the London pool is held at its maximum elevation of 614. I think it is true if that 3 feet of pondage is used for power subject to the paramount right of navigation.

By Mr. Thompson:

Q. Did you say it was a true statement if the three feet were used for pondage?

A. It is not a true statement. Yes, I said it was a true statement if the three feet of draw-down is being used for pondage for power purposes, subject to the paramount right of navigation.

Q. If it isn't being used for draw-down, what then?

A. I have testified it is not a true statement.

Q. Why?

A. Because the London pool would then be fixed at elevation 614 and these power waves would pass through it unchanged, or substantially unchanged, as they would pass through all the other pools down to, and including, the Gallipolis pool.

By Mr. Thompson:

Q. On page 6295 of the record, Colonel Scheidenhelm
2839 testified, in substance, that the operation of the Radford project would substantially increase the low water flows in the Kanawha River. Do you agree with that statement?

By Mr. JACKSON. We object to the form of the question.

By the COURT. I do not recall that that was the subject matter of inquiry before. He can only answer on that supposition.

A. I agree it would increase the average low water flows, but would greatly reduce—unless the plant were properly operated—the minimum low water flows, which is a critical view from the viewpoint of navigation. For instance, in these dry years like 1925 and 1930, the operation of the Radford project would increase the natural low water flow at Radford—at the Radford Dam site—from about 600 second feet to about 1200 second feet, but it would reduce the minimum low water flow from the natural flow of about 600 second feet to down to zero flow.

By Mr. THOMPSON:

Q. At page 6303 of the record, Colonel Scheidenhelm says, in substance: That the Radford project would control floods in such a manner as to increase the head at the Marmet, London and Winfield power plants on the Kanawha River. In your opinion, is that a true statement?

By Mr. JACKSON. We object to that.

A. I don't think that there is any substance in that statement—no appreciable substance to it.

By Mr. THOMPSON:

Q. What do you mean by that?

A. It might very slightly increase the flood heights or slightly decrease the flood heights, but in either case, it would be difficult to ascertain the magnitude of such changes. What Colonel Scheidenhelm meant by increasing the head at London, was that the tail water would be reduced in elevation, by the fact that the flood waters would be held back at Radford. It is highly problematical whether the flood waters so held back would exceed the natural valley storage preempted by the reservoir, and if it did not exceed it, certainly the flood heights would not be reduced on the Kanawha River.

2840 Cross examination by Mr. JACKSON:

Q. Mr. McWhorter, how large a volume, in cubic second feet, would be represented by one inch on the reservoir of the London, Marmet, Winfield and Gallipolis pools?

A. I have not computed that, but it would be the same—substantially the same—for above the project as below.

By Mr. JACKSON:

Q. I do not care about that. I want you to tell me, if you can, what would be the volume, in second feet—or second feet days—required to raise the level of the London, Marmet, Winfield and Gallipolis pools one inch above normal pool levels?

2841 A. I don't know; at least, if I ever knew, I do not have the figures now.

By Mr. Jackson:

Q. Do you know the area of the Gallipolis pool at project elevation?

A. I do not.

By Mr. Jackson:

Q. Mr. McWhorter, the area of the London pool elevation at 614 is 910 acres. Take that down.

A. (The witness makes notes on paper.)

Q. The area of the Marmet pool at elevation 590 is 1,420 acres. The area of the Winfield pool at 566 elevation will be 3,700 acres. The area of the Gallipolis pool at elevation 538 will be 9,760 acres. Now, as an Engineer, tell me what volume of water, in the second foot day, will be required to raise the surface of those four pools one inch?

By Mr. Thompson:

Q. Do you understand that this means raising all pools simultaneously?

A. That is my understanding of his question.

By the Witness. What is it you are after?

By Mr. Jackson:

Q. How much volume of water in second foot days it would take to raise the surface of all those four pools one inch?

A. It would take 660 second feet.

By Mr. Jackson:

Q. What is that?

A. It is 660 second feet.

Q. It would be 660 second feet days, you mean?

A. Second feet for 24 hours. Right there—just a minute—get it straight as we go along. You assume——

Q. All I am asking you is that. I did not ask you to assume anything. Compute the volume of water it would take to raise those four pools one inch, when the elevations are at project level?

A. And you assume——

Q. I did not ask you——

By the Witness. You assume that one inch would be uni-
2842 form over the surface of all the pools, which is not true.

By Mr. Jackson:

Q. I did not ask you that, Mr. McWhorter, did I?

A. I want your assumption.

Q. All that I asked you to do is to compute how much water—the volume of water that would be required to raise those four pools one inch above the project level of those four pools?

A. I made the computation, showing 660 second feet.

Q. Second feet day?

A. Right.

Q. And would it be right to say that two inches would be approximately twice that volume, on each of these pools?

A. Yes.

Q. And three would be three times?

A. Yes, approximately.

Q. Does water, when it enters a pool, tend to seek its level?

A. Yes, sir.

Q. I produce here a letter, dated July 28th, 1936, on the letterhead of the War Department, United States Engineers Office, Huntington, West Virginia, office, addressed to Colonel F. W. Scheidenhelm, and signed John F. Conklin, Lieutenant Colonel, Corps of Engineers, District Engineer, and ask to have it marked as an Exhibit for the Defendant.

(Said letter, exhibit 610, offered in evidence.)

By Mr. Thompson:

Q. When you said it would take 660 cubic feet days to raise the surface of the Marmet, London and Winfield pools——

A. Second feet days.

Q. Second feet days, to raise the surface of the London, Marmet and Winfield dams, one inch above the normal project elevation, did you mean by that to raise the three reservoirs simultaneously?

A. There are four of them, and I answered the question as a hypothetical question as a correct answer to the question Mr. Jackson asked. Of course, I assumed all four would be raised uniformly one inch over the entire aggregate area of the four reservoirs.

2843 By Mr. Thompson:

Q. I hand you, marked for identification, "United States Exhibit 271," and ask you to look at it, and say if you know what it is?

A. I do.

Q. What is it?

A. It is a copy of the protest of the Appalachian Electric Power Company against the application of the Town of Galax, Virginia, for a grant and loan from the Federal Government for the construction of a municipal electric hydro and Diesel engine power plant and distribution system.

Q. Have you ever seen this document before?

A. I have.

Q. When?

A. The Town of Galax made this application for a loan from the P. W. A. to the State organization of the P. W. A., at Charlottesville. That application was forwarded on to the Public Works Administration, at Washington, together with this protest of the Appalachian Electric Power Company.

The Public Works Administration referred the application, together with this protest, to the Federal Power Commission for examination and report.

At that time I had occasion to examine this protest.

Q. Whose name is printed at the end of page eight of this protest, "Brief of Appalachian Electric Power Company?"

2844 Who is it signed by?

A. It is signed "Appalachian Electric Power Company, by counsel, John S. Draper, Attorney."

(Exhibit 271 was offered in evidence over defendant's objection that the same was not proper rebuttal and was inadmissible.)

By Mr. Thompson:

Q. Where is the Town of Galax?

Witness. A. It is in the upper part of New River Valley. On the right band of the river, and some little distance from the river.

Q. How far above the Radford dam would you say it is?

A. I would say probably 65 miles. I am just making a rough estimate.

Q. How far would you say it is from the North Carolina boundary?

A. Perhaps ten miles or less—less than ten miles.

2845 **L. H. Watkins**

Direct examination by Mr. Thompson:

Q. Colonel, referring to page 5702, the tests made by Professor Thomas on August 14 to 15, to determine the effect of power operation on the normal Marmet pool, the witness testified as follows: "I found that there were no seiches that could be attributed to the wave that we ran." Is that a true statement, in your opinion?

Mr. Jackson. I object to the form of the question. I do not know that he is prepared to state whether it is a true statement.

The Court. Go ahead.

Mr. Jackson. Exception.

A. No. I think he may have overlooked certain factors in there and he did not properly interpret it.

By Mr. Thompson:

Q. Upon what do you base that statement?

A. I have here the chart that was furnished by Mr. Thomas to the engineer of the Power Commission, upon the request of the Assistant Attorney General, towards the close of his examination.

This chart shows the Kanawha Falls curve of hydrograph of the Kanawha Falls gage, the upper London gage, the lower London gage, the upper Marmet gage, and the lower Marmet gage, during these operations.

Now, these operations were made under very adverse conditions. In the first place, they were made during a period of low flow, very low flow, when any fluctuations which you could get were necessarily small.

The volume of the wave used in the test was small. It did not amount to a full draw-down from the London pool. It was less, therefore, than 2,600 acre feet.

Just before the test was begun, a sharp wave was sent by, and it was bound to affect the test.

During the test, blocks of power were not put in uniformly up and down, as you would expect the wave to run, and were horizontally taken in and out. These were bound to affect the tests.

Furthermore, during the operation, the crest of the pool at the Marmet dam was allowed to rise two-tenths of a foot. That was it was bound to affect the test.

Now, referring to——

Mr. Jackson (interposing). None of this, so far, answers the question.

Witness. I will show it. Just wait a minute.

I have here Government Exhibit 117-A, which shows a rating curve for the upper end of the pool below the London dam.

2846 Examining this curve and considering the variations which would occur by the 3,200 cubic feet per second discharge for a discharge of 4,100 cubic feet per second, which he claimed that he used during this test, we find that we would expect a rise in the upper end of the pool of about three-tenths of a foot.

Examining the hydrograph for the upper end of London pool, we find it did rise to three-tenths of a foot, and it fell about three-tenths of a foot, but, during the operation, they permitted the crest of the dam at Marmet to rise two-tenths of a foot, and that rise took place during the falling stage of the Marmet dam.

Had the Marmet stage been kept level, it would unquestionably have fallen two-tenths of a foot further, or a total of five-tenths of a foot, so it does indicate, without doubt that this did obey the fundamental law of tipping the upper end of the pool up, and then to have it fall not only to the point of rest, but about an equal distance beyond.

Unfortunately, the fluctuations at Marmet were very small, and it is difficult to show conclusive results. However, in this test made by Mr. Thomas, we have the rating curve for the lower, Marmet gage, which is the upper end of Dam No. 6.

This does furnish very interesting and very conclusive information.

Mr. **Jackson**. I suggest that he answer the question.

Witness. Wait a minute, and I will be glad for you to question me all you want when I get through, and I hope you do.

Now, taking Government Exhibit 117–B—that is another one of these famous rating curves that called so much attention in this Court—take that for a discharge of 3,200 cubic feet per second, plus 4,100 cubic feet per second, we see that we should expect a rise of about 1.2 feet, and, according to my theory, it should fall not only to the point of rest but to a point about that distance beyond.

Now, let us examine the curve: During the operation we find that the upper end of the pool or dam of No. 6 raises about 1.2 feet and that it fell about 1.75 feet. But during the operation, the crest of the dam, the water, rose almost a foot, and it fell again to about the point of rest. 2847

Now, during the downward stage (that is from about 7 P. M. until 3 P. M. on August 15, a total period of twenty hours), we find that the force of gravity and the impulse of the wave entering the pool forced the upper surface of the pool down, not only to less than that indicated by the crest of the dam, but even below the indicated point of rest for 3200 cubic feet per second, and, at the end of the old stage, it was only about eight-tenths above the final point of rest.

Now, during this downward stage, the surface of the pool in Dam No. 6 became more and more horizontal during the last stages of the test, until finally it was only seventeen hundredths of a foot above the water at the crest of the dam.

Now, had the dam not risen, it would no doubt have fallen below the horizontal—it would unquestionably have fallen below the horizontal.

So then, during the whole of the 20 hour period, we find that the force of gravity and momentum of this wave entering the pool was forcing the water down and down and over the dam.

So, at the end, it was impossible for the lockkeepers of Dam No. 6 to get the wickets up in time to maintain the crest that they desired.

Now, throughout their argument, the defendant had used small waves. This one, for example, is less than 2600 acres. Had they used larger, such as those that occurred during average annual flow, they would secure greater results. Furthermore, they neglected the Saturday and Sunday Troughs from Radford, which caused by far the greater fluctuation in pools of this nature.

Mr. **Jackson**. I move to strike out the testimony so far. The witness has not touched the simple question that was asked.

Mr. **Thompson**. He has, but you have not recognized it.

Mr. Jackson. He has repeated his testimony.

Mr. Thompson. He has described a situation which went past you, just like this wave.

Mr. Jackson. He was asked whether or not there were any seiches shown in the pool.

The Court. What is the actual statement?

Mr. Thompson. The statement of the witness, Mr. Thomas, was: "I found that there were no seiches in that pool that could be attributed to the wave that we ran." I asked him if that is a true and correct statement.

The Court. As I understand what the witness is saying, it is in effect not as to the truthfulness and accuracy of the test, but whether, under a wave of larger amplitude, that would not be true.

Mr. Jackson. That is what he said.

Witness. No; I said that he misinterpreted these things.

By Mr. **Thompson**:

Q. Isn't it a fact that there was a seiche there, and he didn't know it?

A. Yes, that is exactly what did happen.

Mr. Jackson. That is the first time that he has commented on the question.

Mr. Thompson. The number of pages that your witness took to answer, it takes some time to cover.

The Court. I think the witness should confine the statement to a smaller compass if he is going to state there was a seiche there which Mr. Thomas did not recognize.

2848 Q. What is your conclusion as to that statement of Prof. Thomas, that there were no seiches in that pool that could be attributed to the wave they ran?

A. He misinterpreted the results.

Q. And there was a seiche?

A. There was. No question about there being seiches in the upper end of the pool, in dam #6, as big and broad as day from night.

By the **Court**:

You mean shown on the chart?

A. Yes, Sir.

By the **Court**:

Or conditions which must have made them?

A. Shown on the chart when properly interpreted.

Q. Referring to page 5744, in discussing the shape and decrease of power wave, the witness concludes; "In my opinion it would be impossible for waves released from a point as far upstream as

Radford to cause any perceptible seiche in these navigation pools". Colonel Watkins, is it possible to release waves from a point as far upstream as Radford and not cause any perceptible seiche in the navigation pools on the Kanawha?

A. The point is,—[interrupted].

By Mr. **Jackson**:

I object to the question as not proper rebuttal. Certainly if anyone expressed his opinion fully in the opening of the Government's case as to what he thought about waves, Colonel Watkins did.

A. Prof. Thomas on proof shows it.

By Mr. **Jackson**. He is doing nothing but asking him to restate his evidence and opinion about it, merely because we offered testimony on the subject as to which they gave testimony in the main part of their case.

By the **Court**:

What do you say to that, Mr. Thompson?

A. The Professor on tests proves the decrease in the waves—[interrupted].

By Mr. **Jackson**:

I move to strike that out. Colonel Watkins you know Court procedure better than to be volunteering statements.

2849 A. The point at issue is the fact Prof. Thomas attempted to prove the decrease in the back end of the wave would be so long it would not affect these pools. Well his own test which he made just to show that purpose, shows it would greatly affect it. The reason for that is very simple. As I have explained a number of times in my examination and cross examination, that the fact which caused the fluctuation in these pools is when the wave enters it, causes it to tip up, then the force of gravity, plus the impulse, momentum of the large volume of wave entering the pool, causes it not only to sink to the point of rest, but about an equal distance beyond. He attempted to show if you prolonged the wave long enough it would cause no effect, whereas, as a matter of fact, the rate of decrease or increase, so long as it occurs in a single day, and so long as the volume and amplitude are the same, makes no appreciable difference in the effect. In the results he made, at dam #6, the wave fell about the same, although he intentionally prolonged it about twenty hours it made no difference whatever, he just simply made a fundamental error.

By Mr. **Jackson**. I move to strike out the answer because the witness states what he previously stated and reiterated on direct.

By the **Court**. The answer may remain in.

By Mr. **Jackson**. Exception.

2850 By Mr. **Thompson**:

Q. Colonel, Professor Thomas stated on his direct examination that he studied by analytical methods and also by constructing what he called an integrating model of the Bluestone reservoir, with different vertical and longitudinal scales, and it was sensitive enough to detect seiches of about five one-hundredths of a foot or five-eighths of an inch, and he continued by saying, "I could not detect any perceptible seiche in the reservoir on this model, which checked my computation, which would show the height in Bluestone reservoir would be less than five hundredths of a foot." Colonel, why, in your opinion, couldn't he detect a seiche in the Bluestone that would be less than five hundredths of an inch on this model that he described?

A. I do not know why.

Q. You do not know why?

A. No.

Q. I do not understand the answer.

A. I don't know why because I have had a great deal of experience in supervising hydroelectric interests and navigation interests in navigable waterways in which this very factor was involved, and I found out in the experiments that when the wave enters the stream it did cause the upper end to tip up and to force the gravity and the momentum and a large volume of power or force over the surface of the pool, not only down through the point of rest but to an equal distance beyond. I was so sure of that I got up and testified in court that this would happen in the pools on the Kanawha River, knowing full well that the defendant, or its subsidiary, was operating power plants on the river above.

Q. You have read the testimony of Professor Thomas with respect to his integrating model, and how he operated it, and the results that he obtained, have you not?

A. Yes.

Q. What is wrong with his integrating model so far as the information or data upon which he constructed and operated it are concerned?

2851 A. I think he made—I know that he made two fundamental errors in adjusting his model.

Q. What were they?

A. One of those was the fact that he adjusted it to conform to the waves of the 1930 tests, and he adjusted it to conform to the amplitude rather than the volume. Now, looking at those waves, you can very readily realize that they are not going to maintain their persistency in altitude.

Q. Why not?

A. For the simple reason that the amplitude at which they were discharged from the Buck project was far too great for the volume. You could not expect such waves to persist like that.

Furthermore, he did not adjust it to the most persistent wave which anyone would readily understand would be more or less typical type of wave for the river.

In the third place, in another place in his testimony, he stated that he did not adjust his model to conform to the volume—he did not use the volume in testing it. I have had a great deal of experience in tracing waves of different forms, and especially downstream, by simply using the rating curve in the stream and constructing a flood channel, as inflow and outflow curve, and I have constructed waves of various forms actually thousands and thousands of miles. I do know if he adjusted his model without using volume for adjusting it, it will not give accurate results.

Q. And you say he did adjust it without using volume?

A. He stated it in his testimony.

Mr. Jackson. Will you give me the reference to the page?

A. Will you give him that, Mr. Thompson? It is in the notes. One on the point is on page 5836. He uses these words: "I then ran tides down the model corresponding to the 1930 tides and checked the change in the profiles at those tides, and then adjusted the baffles between gaging stations so the model would reproduce the profile or hydrographs of the 1930 tides."

Then, again, on page 5855 of the manuscript, during his cross-examination, he answered about the 1930 tests, "I did not figure volume." Then the question, "Didn't you figure volume at all?" and he answered "I figured volume at various times in the study, but not for the purpose of adjusting the model."

By Mr. Thompson:

Q. Now, it is your contention that you cannot adjust a model of that kind unless you do figure volume?

A. Let us take a very simple thing: Anyone, even a layman, knows that the more the rain the higher the flood. The same thing applies to power waves coming downstream. And, furthermore, if you do not consider volume in adjusting, you have no absolute way of checking your results below.

2852 The volume I found in tracing waves downstream, if you use volume you can check your results all the way down the stream.

Q. You said there were two fundamental errors; you spoke of volume and then you spoke of using the data of the 1930 wave?

A. Yes.

Q. Wherein did the error lie in using the data of the 1930

A. As I have already explained, those waves were not of a shape and they were not discharged in a manner to possess any amplitude, and, in the second place, those waves had nothing to represent the Saturday and Sunday trough coming from Radford.

After all these successive waves, we know they are going to overlap and not persist permanently. On the other hand, the gap between the Friday wave and the Monday wave is so great that there will be no overlap, so that we may expect such a trough as that to go hundreds and hundreds of miles downstream and lose their amplitude between the crest of the week day wave and the trough of the Saturday wave.

By Mr. THOMPSON:

Q. Could the witness' conclusion be correct from the data and tests that he made, as testified to, that perceptible seiches could not be observed in the Bluestone reservoir from waves coming from the Radford project?

Mr. JACKSON. I object to the form of that question.

The COURT. I will let him answer it.

Mr. JACKSON. Exception.

A. May I have just a moment to think about it? These are technical engineering questions and asked in entirely different form, and I would like to think about it a second so I do not make a mistake. The methods of adjusting his model indicate that the results would not be wholly reliable. My own experience indicates that when a wave does enter the upper end of a pool it tips it up and falls about the same distance below. Mr. Thomas' own tests down on the Kanawha confirm that fact very conclusively.

The COURT (interposing). He just testified a moment ago with respect to these waves about which Mr. Thomas testified, while he did not say whether or not they would create seiches he said his tests were based on inaccurate data of the volume of the wave—that no such wave as that would in effect occur. I did not understand him, however, to deny presuming the waves used by Mr. Thomas in his tests were those which would actually take place; that statement of Mr. Thomas, or the conclusions of Mr. Thomas were inaccurate. He said his tests were based on inaccurate data, as I understand. Is that correct?

WITNESS. Yes, sir; and not consistent with what I have found out by experience.

By Mr. THOMPSON:

Q. Does that go to all types of waves?

A. To all types.

Q. I believe you have testified that it is not possible to properly adjust a model to determine persistency of waves without considering volume; is that right?

Mr. JACKSON. I object to the question as leading.

The COURT. He may answer it.

Mr. JACKSON. Exception.

A. I do not think you can get reliable results. You
2853 may by accident hit the adjustment, but I do not think
that they will be reliable.

By Mr. THOMPSON:

Q. I call your attention to the testimony of Professor Thomas on page 5908:

"Q. Will you explain to the Court the principle of the integrating model?

"A. Such a model is a model of some hydraulic structure which does not resumble the structure closely physically, but satisfies the same mathematical equasion. I think I can best explain the principle by using the chart."

Then there is a great deal of testimony with respect to the chart. Now, I want to ask you this question: Would this model, as described by the witness and as operated by him, give correct results so that he could apply an algebraic formula to it, if based upon the data which he says that he got from the 1930 wave tests?

A. His results, of course, would be in error if he makes mistakes in the adjustment.

Q. State whether or not there is any value of a mathematical formula or an algebraic formula, if that is what it was, applied to a model where the data upon which the model is adjusted does not include the various items which it should include to properly adjust it?

A. Oh, well, no doubt he included the items he should have included, but he used an improper basis for adjustment. I would like to state that in the formula itself that he shows is a very long and complicated thing. In an integrating model you can get wonderful results for current around dams and other flumes, and also current in river channels like the lower Mississippi, but when you come to measuring just the way a river will discharge a volume of water downstream, you have a very complex problem. If your model is not carefully constructed and not properly adjusted, you can't get reliable results. There are no two ways about it.

On the other hand, if it is carefully constructed to show close correspondence to the river and for each section downstream, and it has these baffles placed in it with points corresponding to the very shoals and restricted to parts of the channel adjusted to conform to the actual obstruction and stream flow, and if 2854 it has in it every important thing, the channel storage corresponding to the channel storage downstream, and you adjust that model to discharge volumes downstream in a manner typical of the river, then you can undoubtedly get very good results.

Q. Did he have this model adjusted according to his statement as you understand it to these various items you have described?

A. I have stated he had two fundamental errors in there. There in his testimony he stated he did not attempt to locate the baffles at corresponding points of obstruction in the channel itself.

Q. So would or would there not be any virtue in applying a mathematical formula to an adjustment of that kind?

A. As I said it is very complex. The waves themselves are very complex, and if you make an error you will not get reliable results.

Q. You mean by error such error as you have described?

A. Yes, sir.

Q. On page 5925 and 5926, the witness stated: "In determining the percentage of reduction of waves, it is important to take into consideration a great many things, among them whether the wave occurs on a rising or falling stage of stream; whether the wave is a series or group of similar waves, or whether the adjacent waves are larger or smaller, whether there are minor wave summits between the main wave summit, all of those things enter into the question of what the reduction in amplitude and volume will be, and in the case of the 1930 wave series, we noted there was an enormous variation in the percentage of reduction and volume in the individual waves and those percentages depending on a variety of conditions which were present in that series." Please state whether or not Prof. Thomas could have obtained a reasonable estimate of the percentage of reduction of waves by considering the things he has here stated?

By Mr. **Jackson**. I object to that question as not proper rebuttal.

By Mr. **Thompson**. He has stated the conditions——

By the **Court**. He may answer.

A. It would be practical to make a reasonable estimate.

Q. Would that be practical without considering the question of volume?

A. No; you would have to consider volume. As an estimate for use in this problem I suggest we adopt the waves at

2855 Kanawha Falls, a volume of about 80% of that for the wave discharged at Radford. Now for each section of the river there is a more or less constant relation between the volume and the amplitude of the waves. If for the purpose of this problem we adopt [interrupted].

By Mr. JACKSON. I object to the answer. He has already answered the question.

By the COURT. He may complete his answer, but I don't want a long dissertation.

By Mr. THOMPSON. I have given the series of matters the witness thought important in determining the percentage of reduction of waves, and I asked if that could be done satisfactorily without considering volume.

By Mr. JACKSON. He has answered that.

By the COURT. I understood him to say no.

A. I have answered that.

Q. Referring to record, page 5356, the testimony of Mr. Putnam:

"Q. How did you arrive at this expenditure of $200,000,000; in other words, how many reservoirs did you figure on constructing?

"A. I figured an average lift of twenty feet at each dam, making roughly about 1,800 feet of fall, approximately 1,800 feet between the head of London pool and the mouth of Wilson. I mean to overcome that fall some 90 locks and dams would be required, with an average lift of twenty feet.

"Q. Why did you only make it twenty feet?

"A. Because, there were two reasons for that, in the first place I felt if I exceeded twenty feet in some locations we would get into difficulties with the railroads along the bank; in the second place there is from the point of view of improving a stream for navigation an economical limit, beyond which it is not wise to go on the question of lift, in other words, in attempting to save the number of dams."

Q. Please state whether or not, in your opinion, that is a feasible or reasonable way of developing navigation on New River.

By Mr. JACKSON. I object to the form of the question. I don't understand this procedure of reading a page from the transcript and then asking the witness a question.

By the COURT. Of course that is unusual, but this record is so large it is difficult to remember or keep track of what witnesses said ~~exactly~~, and I am admitting it for that reason, and in an effort to expedite matters.

A. No; it is not a reasonable method.

Q. Why?

A. In the first place these low dams, only twenty feet, will be well below flood height along the river. They will be unable to assist at all in flood control of the river, and if gates are installed and operated with fixed crest at the dam, like those on the lower river, this long series of dams would materially increase flood heights below, and in the second place the dams are so low that you could not economically develop power at these sites, and what you could develop would be flooded out during all floods.

Q. Would that be the best or even the practicable way of improving that river for navigation?

A. No.

Q. Why not?

2856 A. In the first place too many dams, no excuse for that many dams. It would simply be so low navigation would be absolutely flooded out during periods of flood. You have high floods on this river. And in the third place, you can't build dams in the river without affecting other interests, it is impossible to put them in without affecting other interests.

By the Court. Isn't that exactly what the Government has down so far in its navigation dams, built them about twenty feet, about twenty-four at London and Winfield; isn't that exactly what the Government is doing, building a series of comparatively low dams to aid navigation on that river; do you criticise that?

By the Witness. There is a reason for that, that section of the river is built up with manufacturing plants and all sorts of things are along the river, so you can't get them higher than they are. I have asked the engineers why and they say you can't do it without flooding out all these interests.

By the Court. Isn't that what Mr. Putnam said ~~they~~ ought to be, around twenty feet, what they are?

A. Up on the New River.

By the Court. I didn't understand him to say extending all the way up the course of New River.

A. All the way to Wilson Creek on New River. I have made a study of the lay-out of possible projects all the way from the mouth, right to Wilson Creek, and I have taken into consideration the railroads and flood heights and all those factors, and I know you can lay-out a god system of projects without materially interfering with the railroad, except in places, and without flooding out any point in local centers, ranging in height from about forty feet to seventy-five feet. With higher dams such as Bluestone, Radford, etc., you can lay-out a good system of projects all the way up that will assist greatly in flood control, development of power, and all those things.

2857 Q. State if there isn't a difference in the gradient of the Kanawha River down where the Government dams are put and the gradient of the New River from the Kanawha Falls, or from the Gauley River up to Wilson Creek?

By Mr. JACKSON. We concede that.

A. Yes; the slope in the lower river is much flatter.

By the COURT:

Q. Col. Watkins, have you made an estimate of the cost of developing that river for navigation?

A. Yes, sir.

Q. What is your estimate of the cost for a 9-foot channel?

A. I don't recall now what it is. I can say that the combined development of the river for navigation, flood control, and power was a very attractive price. I don't recall the figures. It was some time ago. I haven't them with me.

By Mr. THOMPSON:

Q. Can you give an approximation of it?

A. I made a very detailed study of the river for all of the facts involved in it and I don't recall what the figures are now.

Q. Was it more or less than $200,000,000, if you can remember?

A. Well, it was a combined development. I didn't consider these low dams because, frankly, they are absurd when you talk about using them for the development of the river, and I don't recall what they combined but I do know that the economy of the development was unquestionably for power and you had excellent flood control and you could certainly expect in the future to economically develop through waterways or anything of that nature you wanted.

2858 Cross-examination by Mr. JACKSON:

Q. Col. Watkins, will you define an integrating model?

A. Mr. Thomas gave a very detailed description of it.

Q. You tell me. You define it briefly now so we will get through.

A. Well, an integrating model is a model that, in order to bring the proportion of the section of the river or other factor considered, within reasonable ranges, you foreshorten the total length and thereby you increase the slope, you modify the cross section of the volume and you do a great many things that are certainly not in the river itself, so in order to use that you have got to use a complex formula just like Mr. Thomas described. That, in my opinion, is a very good description of an integrating model. I don't say you can't get good results for certain things, but it is complex.

Q. Is it the application of analytical and mathematical methods to models?

A. Oh, yes; you can apply all sorts of formulas, empirical, or other formulas.

Q. You said it was a matter of adjusting. You mean it is a matter of scale?

A. No; I mean adjusting it so you get the right results, in measuring the persistency of waves. That is what he was trying to do.

Q. You spoke about foreshortening—what was it—the length?

A. You mean this integrating model?

Q. Yes.

A. Yes.

Q. In your understanding is that merely a matter of scale?

A. Well, if you foreshorten the length you are going to increase your slope and if you reduce the width you are
2859 going to affect the manner in which that remaining channel
is going to discharge water and all sorts of factors. They can be corrected by formulas but they are empirical formulas.

Q. What I am getting at, do you mean that the matter of an integrating model is a mere matter of adjustment of scale?

A. Oh, no; you have got to do a whole lot more than that. You have got to make the slopes conform somewhat to those of various sections of the stream. You have got to put in baffles at the right point to go around and represent obstructions to the stream; you have got to go ahead and put in channel storage corresponding somewhat to the channel storage of the stream—I mean if you are going to measure the effect on waves.

Q. Your idea is that in an integrating model you just have the original on a reduced scale?

A. No; you have it on a distorted scale.

Q. But it is a mere matter of adjusting scales as related to the original, in your opinion?

A. No; it is not a mere matter of that. It is a mere matter of getting all the factors which affect the shapes and forms of waves as they go downstream. It is a complex problem.

Q. Do you understand that there is placed in the integrating model something to represent particular falls, for instance?

A. Yes; undoubtedly you can put them in there but Mr. Thomas said he didn't have anything in there that represents Sandstone.

Q. In your judgment, in an integrating model, should you have in the model something in the form of a baffle, or otherwise, that represents each particular falls or obstruction in the river?

A. I say there should be something to do that because if you group those baffles near a rating station it is going to cause successive waves that come along to run together at that point and help to dampen out their persistence. In other words, you don't
keep them separated. If you group those baffles in place
2860 and don't locate them along the stream like they should be,
you are going to make them run together and loose the persistency just as you would if you stick a whole lot of storage between those rating curves and, although it may measure one

rating curve all right, if you turn loose a series of successive waves down through there, that storage is just going to wipe them all out.

Q. Col. Watkins, we are trying to get through with it. If you don't mind answering my question and avoiding any long dissertation after it, it would help out a good deal.

By Mr. Thompson. I insist that the witness be permitted to answer.

By Mr. Jackson:

Q. Did you understand that Prof. Thomas grouped his baffles in the way you have described?

A. He stated he located them along the rating curve, in his testimony. He stated he did not locate them along where the obstacles of the stream were.

Q. Is it your understanding that Prof. Thomas grouped his baffles near the gaging stations?

A. I don't care where he located them. I described where he located them. He spoke of setting them in there and he did say he didn't take any trouble to locate them.

Q. You don't know where they were located, do you?

A. No; I don't.

Q. Why do you say they were grouped below the gaging stations?

A. Because if he didn't locate them where the obstacles of the stream were he is not going to get correct results.

Q. Is it your idea in an integrating model, you have a baffle located just where each obstruction is in the original?

A. Yes; for the simple reason that if you don't you are going to ruin your waves. You are going to run the successive waves together.

Q. You don't have to argue with me if you will answer the question.

A. I want to make this emphatic. You are asking me these things——

By Mr. Jackson:

Q. Col. Watkins, did you ever construct an integrating model?

A. No; I haven't—yes; I have too, but not exactly perfect—simply to get the effect of dams, other shapes of dams and currents that result therefrom. May I continue my answer? 2861

I may say for determining the manner in which waves have gone downstream, I have gone to the stream itself, which is much better than using a model, and I have used simple rating curves and simple flood storage curves and used those as a yardstick and traced them right downstream with the very factors of the stream.

It is much better than simply using a model. That is why I haven't used them for tracing them downstream.

By Mr. JACKSON. I move to strike out the answer as not responsive.

By the COURT. Let it stay in.

Q. (The question was read as follows): Col. Watkins, did you ever construct an integrating model?

By Mr. JACKSON:

Q. Did you?

A. I have answered that.

Q. Say yes or no.

A. I said I have used models to help me and I went ahead and told you why I didn't use them more.

Q. Have you ever constructed an integrating model?

A. No; not according to the system of Mr. Thomas.

Q. To be perfectly frank, you have not; isn't that true?

A. In a small way it was, not according to his formula. I didn't have to go into all the detailed formulas for those kind of things.

Q. You never constructed an integrating model of the kind that Prof. Thomas was using, did you?

A. Not of the long detailed kind that he did, but simple models for determining stream flows about dams and those things.

Q. I am asking you about integrating models?

A. No; I didn't do it and I told you why I haven't, because I can get much better results as to these waves downstream in going to the stream itself.

By Mr. JACKSON. I move to strike out the last part of the answer as not responsive.

By the COURT. I will let it stand.

By Mr. JACKSON:

Q. The models that you used looked like the original except they were smaller, didn't they, or at least, intended to look like the originals?

A. Somewhat like it. In some cases it was simply sections of the stream instead of the whole stream to determine just 2862 the way the velocity of the current would run over a dam or something like that—very simple.

Q. And the more your models looked like the original, except in scale, and were like the original, the better they were, were they not?

A. Yes; the better they were, the more like the original they were, the better they were.

Q. In other words, you simply had a scale model of the original that you were studying, didn't you?

A. Approximately so.

Q. And not an integrating model; is that right?

A. I think that is more the case. There was some of the scale somewhat distorted, but not much.

Q. As you understand it, is distortion of scale the sole characteristic of an integrating model?

A. Oh, no; Mr. Thomas, I think, has explained in detail his model, and I don't think you need to go into it farther.

Q. The fact is you never knew what an integrating model was like until you read Mr. Thomas' description of it, did you?

A. I knew there were such models. I have never had any necessity to use them. I could always go to the stream itself and get my data which is much more reliable, so that I have not gone into it.

Q. You do know that the United States Engineering Office uses integrating models and has tests made in the laboratory of the Carnegie Institute of Technology, don't you?

A. Yes; I know that, certainly.

Q. They do that right along, don't they?

A. Yes; but those currents measured there are not waves coming downstream. I just said these waves are complex. These currents are simple.

2863 Q. Don't you know that the United States Engineering Office now is having built an integrating model in the laboratory of the Carnegie Institute of Technology, for studying flood waves passing downstream?

A. No; I didn't know that.

Q. You didn't?

A. No.

Q. You haven't kept up on the matter of integrating models in the study of stream flow, have you?

A. But I do know that New River has plenty of gaging stations all the way up and downstream, and at its tributaries for you to go to the stream itself and measure the effect and the form and the shape in which waves will come downstream, with an accuracy depending solely upon your own computations and it will take in every physical characteristic of the stream all the way down from top to bottom.

Q. And did you, Col. Watkins, ever release a wave at Radford of the size and form that you are talking about and actually measure it at the gaging stations downstream on New River?

A. No; I didn't need to, not for the purposes of this problem, because my knowledge was good enough to let me get within a reasonable estimate of what would be the results just as those famous rating curves I constructed on the lower river do give the results down there. I can give you just about the same results with these waves on this river so far as the factors of this problem are concerned.

Q. In other words, you were not able, were you, to turn out a full-size wave of the kind you were studying at Radford and actually measure its action passing down the river?

A. No; but my experience is that it wasn't necessary, not necessary with the experience I have had on this river. It was not necessary for me to go up there and make an estimate, which was good enough for all purposes of this problem, for the simple reason that the effects are so great that we don't have to get down to very close details, very fortunately.

Q. Whether you had to or not, you didn't do it?

2864 A. No; I didn't do it and I explained why I didn't do it.

Q. It wouldn't be possible to do it, would it, at the present time and under present conditions?

A. I may add, of course, Radford isn't there and I don't have to have it there to make an estimate.

Q. I understand you don't need any estimate, but I am trying to get at the facts you did have, if any. Col. Watkins, I want you to state briefly the precise error that you found in the adjustment of the integrating model by Prof. Thomas?

A. As I have already explained, one of them was due to the fact that, according to his statement, he adjusted the model to conform to the wave discharge by the 1930 tests. Now, those waves, on account of the form in which they were discharged, had a great loss in amplitude and, to a certain extent, in volume, and they had no Saturday trough, which, after all, is the most vital factor in this problem, and, in the second place, they were not adjusted according to the witness' statement, according to volume. He didn't consider volume. I have had enough experience to know well enough that you cannot get accurate results with any model if you do not make a discharge of volume downstream and the manner in which a typical wave of the stream goes down.

Q. I am only trying to get your errors and unless you are under compulsion, you don't need to argue each one as you state it. At the present time I understand you claim one error in adjustment; that is, that Prof. Thomas, in adjusting his integrating model, did not take into consideration the volume of the waves, of a 1930 wave; is that right?

A. He said he didn't consider volume in adjusting his machine.

Q. And you claim he did not consider volume in adjusting the integrating model?

A. I claim that he stated he didn't.

Q. That is one error you claim in adjustment; is that right?

2865 A. That is one of them.

Q. Do you claim any other error in adjustment of that integrating model, if so, what is it?

A. I claim he stated he adjusted it to conform to the 1930 waves of the 1930 test.

Q. Do you claim he didn't do it?

A. No; I don't, he said he did, and I say that was an error.

Q. You claim that data was not proper, but I am trying to find out what errors you claim Prof. Thomas made in the adjustment of his integrating model?

A. I think I have made that clear.

Q. Is there any other error you claim he made than your assertion that he did not take into consideration the volume of the waves in the 1930 wave tests?

A. His evidence indicated that he did not locate his baffles according to the position of the various obstacles that flow downstream.

Q. The second error that you claim is that the integrating model did not have a baffle corresponding to Sandstone falls and every other falls in the river or obstruction in the river; is that right?

A. If you are going to get perfect measurements of the persistency of a wave going downstream, you cannot neglect to put obstacles proportionately along which conform to those in real life, for the simple reason that if you don't locate them right and exhibit them, you are going to run the waves together and you are going to lose them.

Q. Are you talking now about an integrating model or a scale model?

A. Yes; I am talking about any kind of a model.

Q. Any kind of a model?

A. Yes, sir; any kind of a model.

Q. You make no distinction between an integrating model and a scale model in this respect?

2866 A. No.

Q. You still haven't answered my question. I am asking you for the second error that you claim in adjustment?

A. I have already told you two, and I have told you three. Look at the record.

Q. Wait a minute.

A. Don't try to confuse the issue. I have told you two positively and I told you this other baffled.

By Mr. **Jackson**: I move to strike out the statement.

By Mr. **Jackson**:

Q. You have told me that you allege one error in adjustment in failing to take into consideration the volume of the 1930 wave and for the failure of the model to discharge volumes, failure to adjust the model to discharge volumes.

A. Failure to adjust the model to discharge volumes?

Q. Discharge volumes of what?

A. Water. He said he didn't take into consideration the volumes in adjusting his machine, he made an error.

Q. We will agree that you claim that is one error. Can we let that alone. The second error that you claim is that he didn't put baffles in the model at the sites of the various obstructions in the river; is that right?

A. Let me review the errors.

Q. No.

A. No; it isn't right, for the simple reason that I have already given you three errors in his adjustment. Let me recite them over again.

Q. Just a moment.

By the **Court**. Gentlemene, I think I will have to take charge of proceedings.

By the **Court**:

Q. Col. Watkins, you answer the questions as they are asked you. You have got a right to explain your answer to a reasonable extent, but I am somewhat in the same position as Mr. 2867 Jackson. You keep referring to three errors, and I can't remember where you have pointed out any except two, one relating to the volume of the water and the one to what you say is a mislocation of the baffles on the model. Let us expedite this thing by a little order.

By Mr. **Jackson**. All I want him to do is list them and I got two, as I understand it. Now I want to find out is there another one.

A. May I repeat what I have already said as to the errors?

By Mr. **Jackson**:

Q. Please don't.

By the **Court**. Let him answer it in his own way.

By Mr. **Jackson**. The trouble is I will be no further ahead when he gets through and will have to start over again.

A. The first error is the fact that he adjusted his model to conform to the waves of the 1930 tests. That is error No. 1.

By Mr. **Jackson**:

Q. Just a moment.

By Mr. **Thompson**. Let him finish.

By the **Court**. Go ahead, Mr. Jackson.

By Mr. **Jackson**:

Q. Is it your contention that the integrating model ought not to have been adjusted to conform to the results of the 1930 wave tests?

A. You can utilize them for adjusting them to the 1930 wave tests but you can't just go and pick out any wave you like as apparently the witness did, from the results he obtained.

Now, may I answer and show you just why you can't follow those unless you are careful about just what you get from those tests?

By Mr. **Jackson**. If Your Honor please, all I want to do is to get a list of the alleged errors.

By the **Court**. Yes, that is all I want and if this witness will start the statements over——

A. I will be glad to give each one without an interruption, if I may. 2868

By the **Court**. The trouble is, Col. Watkins, that after you have given each one you want to enter into a long explanation of it which is not being asked for. Now, enumerate the errors, as briefly as possible.

A. Error No. 1: The model was adjusted to conform to the 1930 wave test, which, on account of the way the test was made, had great reduction in amplitude and reduction in volume in the admitted Saturday and Sunday trough. That is error No. 1.

Error Number 2: The witness states that he did not consider volume in adjusting his model. That is error Number 2.

The third, as I stated, he did not locate his baffles to conform to the location of the various obstructions of stream flow. Those are the three errors I have listed.

Q. Are there any others in the adjustment of the model?

A. He did not go into detail about flood storage or channel storage. That is an important factor in this problem.

Q. Do you claim any other errors in the adjustment of this model?

A. No, sir; but he did not give details on those things which are important factors.

Q. Do you contend that, with a properly constructed integrating model, Professor Thomas should not have been able to reproduce the essential results of the 1930 wave tests?

A. No; I don't claim he could not. He no doubt could.

Q. Don't you think that a properly constructed integrating model should be able to reproduce them?

A. He probably did reproduce them very accurately apparently—the 1930 wave test—it probably is.

Q. Aren't you sufficiently familiar——

A. (Interrupting.) The trouble was, the results that he claimed indicate to me very conclusively that he adopted ~~in~~ the 1930 wave tests, waves that had too small a persistency, and that is the fact in the case.

Q. In other words, the results do not accord with your opinion and you think they are wrong?

A. They do not conform with what I know would be about right.

2869 Q. Don't you know enough about an integrating model to know that the volume is automatically reflected in the operation of the model?

A. We are talking about waves going down stream in forms and shapes.

Q. Will you answer my question?

A. I will say, if he did not consider volume in adjusting the integrating model—I don't care what his formula was, you will not get correct results.

Q. I am asking you if you know enough about an integrating model to know that it automatically reflects the volume?

A. Sure; maybe in stream flow and that kind of thing.

Q. Don't you know enough about integrating models to know that baffles are never located in the models to correspond with the location of the obstructions of nature, but merely to reproduce the conditions of stream flow to correspond with the hydraulic lines that control at the control points?

A. I know that is fine for determining currents and those things, but I know that the factors controlling the waves are so complex that you will not get good results if you group them together in one place or another and don't distribute them in the stream. I know that. I know that.

Q. You know the results of an integrating model, although you never constructed one?

A. Yes, sir.

Q. Do they test the same as a scale model?

A. Yes, sir. I can say they could, because I have had so much experience following waves down stream, and I know what will happen to a wave all the way down and how it will behave. I have traced them so many thousand miles downstream, I know the factors involved.

Q. Colonel Watkins, what is the natural period of oscillation in pool No. 6, on Kanawha River?

2870 A. I don't know. I think I saw some peaks in the curves of Mr. Thomas' testimony that indicated about two hours, and I think that is correct.

Q. Do you think 2.4 might be correct?

A. That is about right, I guess.

Q. Yesterday, you testified about some tests made by Professor Thomas at Marmet pool?

A. Yes, sir.

Q. And you referred to a flow of 3,200 cubic feet per second. What did that flow represent?

A. I took that from the average height of the gage at Kanawha Falls, indicated on the chart [witness indicates paper in his hand].

Q. Did you intend that flow to represent the base flow that existed at the time of the tests?

A. That is what I understood it was.

Q. And you got that, you say, from the Kanawha Falls gage?

A. Here it is shown on your chart; yes, sir [indicating].

Q. Can you answer the question?

A. Yes, sir. This one on the chart.

Q. I will ask that the question be read. (The question is read). That is, your 3,200 second-feet figures was based on that?

A. Yes, sir; as shown as on this chart [indicating].

Q. Did that represent the flow out of the power station at Marmet prior to the tests?

A. It represented the flow at Kanawha Falls. It was approximately the same so far as the factors in this problem are concerned, for measuring the stages in the gage heights which would occur.

Q. That would depend on whether or not the flow through the power station was any different at London and Marmet, wouldn't it?

A. No, sir; for the reason that all the discharges is to give you just the approximate place on this rating curve in the stream so that you may measure the changes that took place with a discharge of so much, and if you make an error of ten per- 2871 cent in it, it will not materially change the results, so that any error I made in assuming 3,200 cubic feet per second was not the base flow of the stream, will not greatly affect the results.

Q. Regardless of your feeling about that, the fact is that the flow down in the Marmet pool, any flow, and the Number 6 pool, whatever it is, depends on the amount of flow through the power station and not on the flow at Kanawha Falls?

A. The wave tests——.

Q. (Interrupting.) The tests were taken when?

A. The 14th and 15th.

By Mr. Jackson:

Q. Is that right?

A. Oh, yes.

Q. What time was the test wave taken at Marmet Power station?

A. According to the chart, it was started—your load at two P. M., on the 14th.

Q. What was the power out of Marmet power station just before the wave commenced at that time, two o'clock on August 14th?

A. I don't know exactly what it was, but I assume, for the purpose of this problem, that the flow, 3,200 C. F. S., as indicated by the Kanawha Falls gage, was base flow. Any error that I made would not materially affect the problem.

Q. You undertook to criticize these results yesterday on the assumption that the base flow was that shown by the Kanawha Falls gage?

A. Yes, sir.

Q. And you took that to be 3,200 second-feet?

A. Yes, sir.

Q. If that base flow at Marmet power station at the time of the wave was 1,800 second-feet, that would be a great deal more than ten percent error in the assumption, wouldn't it?

A. If it were 1,800 second-feet.

Q. It would be a forty-five percent error, wouldn't it?

A. It would be about that, but may I state that it would
2872 not materially affect the results, except it would make the wave go down much lower below the horizontal.

Q. Now, what was the power output at Marmet just before the wave was initiated?

A. At Marmet?

Q. Yes.

A. The London power house.

Q. Marmet?

A. It is on your chart here [indicating].

Q. You said London? I just wanted to correct you.

A. It is on the chart here [indicating]; you show it to be one o'clock it is 3,000 k.w.

Q. What was the flow corresponding to that 3,000 k.w. out of Marmet power station?

A. I don't know exactly what it was at that time. I took your figure of a change in flow of 4,100 cubic feet per second, which Mr. Thomas said he used.

Q. You are talking about the increase. I am talking about the base flow. Don't you know the 3,000 k.w. at Marmet would correspond to a flow of about 1,800 second feet?

A. No; I did not go into the details of checking exactly the flows here. What I was interested in was the change. It is the change that matters. As I said, you would not greatly change results. The results that you get, if the flow happened to be 1,800 feet per second and not 3,200; it would not greatly affect the results, except, as I said, it would go lower—the lower part of the wave would go down below horizontal further.

Q. Laying that to one side, you under took to criticize Professor Thomas' results without even attempting to determine what was the actual base flow out of the Marmet power station
2873 before the wave was initiated?

A. I had no intention of criticizing the results. All I did was analyze them.

Q. You undertook to——

A. (Interrupting.) I undertook to analyze, not criticize the results, and I did take into consideration those factors necessary for a correct analysis of the problem.

Q. According to your idea, the correct analysis of the problem did not require a determination of that—what was the wave at the Marmet power station?

A. It requires you to determine what portion of the rating curve to use in determining the change. If that were only 1,800 second feet, it would make a slight difference only, but not enough to materially affect the situation.

Q. Let me know if 1,800 second feet is not right, later on in the day.

A. I will state that 1,800 is correct, if you say so. I will accept that, if it is correct, because it will not materially affect the results. It will make them smaller, but not materially affect it, because you have written the curve right where it was at the beginning and you have it where it was at the end. I measured that rating curve change and I know it gave approximately the right results. If I took 1,800 instead of 3,200, it will not greatly change it. You can take it and look at it.

Q. You mean it will not change your opinion?

A. It will not change the results. It is known. That is, it is so. It is measured here in black and white—written.

Q. What was the gage reading at Marmet lower gate power station during the base flow discharge immediately preceding the formation of the wave?

A. The Marmet lower gage?

Q. Yes, sir.

2874 A. It was at 564 and about .2.

Q. Is .17 about right—564.17?

A. According to this curve, it is nearer 18.

Q. In your testimony yesterday, you referred to Government's Exhibit 117-b. Will you please refer to that Exhibit now and give the appropriate back water curve on the Exhibit and state what it shows as to the flow corresponding to elevation 564.2?

A. (Witness refers to papers.) You will have to express the flow, 564.2, in discharge per cubic feet per second to get the elevation on this curve. I used 3,200 cubic feet.

Q. What does your chart show to be the discharge at elevation 564.2, on your Exhibit 117-b?

A. Oh, yes, I see—564.2—[witness examines papers] it shows a discharge of 4,200 I believe.

Q. 4,200 second-feet?

A. I believe that is it.

Q. What is the matter with your back water curve?

A. What is that?

Q. What is the matter with your back water curve?

A. Nothing, so far as natural slope is concerned. Maybe it is not high enough or low enough in particular places.

Q. You have agreed that the discharge at that time was 1,800 second-feet, and would you think the back water curve, which gives you 4,200 second-feet, when the actual discharge was 1,800 second-feet, was in error or not?

A. We will look at this; an answer to your question requires consideration of questions that have gone before and must have an explanation. That is all there is to it, and that explanation is that, when you look on the days, you see that on the immediately preceding days, there was a very sharp power wave, which unquestionably did affect the gage height, and it would measure the discharges at this particular time. That is the answer there.

By Mr. JACKSON. I will ask that the question be read. [The question is read.]

2875 A. I think my answer is excellent to that, because I explained the factors which were existing at the very time the measurements were made, which I said did affect the gage height, therefore that would affect the gage reading.

Q. Will you say whether or not you think that result would indicate the back water curve to be in error or not?

A. No, sir, it does not, because you take those factors and it will not be due to the gage height.

Q. I just want your views.

A. I used the average flow to go on.

Q. Did you take the flow at Kanawha Falls?

A. I took the actual flows existing at the time the tests were made.

Q. And the 1,800 was actually existing at the time of the test?

A. Yes, sir, but was it the average daily flow. The Kanawha Falls gage indicated it was 3,100. I don't give a dern what it was when the test was taken, but I am talking about the average daily flow. That is the one to use. That is correct, you betcha.

Q. Starting, Colonel Watkins, with the known flow and a known gage height at the foot of Marmet Dam and power station, will an increase of discharge from the power station cause a change in the water level?

A. You mean of the crest of the dam?

Q. I mean tail water increase.

A. The crest of the dam.

Q. No, the tail water?

A. Will an increase in flow cause that? You would expect it to, unless some other factors entered.

Q. For an increase of 4,100 second-feet flow through Marmet Station being the amount which you say Professor Thomas gradually increased the flow during the afternoon——

A. [Interrupting.] He said that.

2876 Q. Do you challenge it?

A. No, sir.

Q. (Continuing.) What increase in water level would that produce below Marmet Dam?

A. I believe I measured it yesterday and it was about——

Q. (Interrupting.) Look at Exhibit 117-b and tell me the results.

A. (Witness examines papers.) With an average daily flow of 3,200——

Q. (Interrupting.) I didn't ask you that.

A. That is what I have to look at to get the correct measurement for this problem. You want me to measure it and I will measure it. I have to do that to get the correct measurement.

Q. Give me your answer.

A. Well, let me give you my answer. It is a change in discharge of approximately 1.2 feet.

Q. What elevation would that result in?

A. A final elevation of approximately 564, or approximately 565.

Q. Wouldn't it be better than that?

A. Just a slight shade above it.

Q. You start with 564.2 and add 1.2 to that, according to your estimate; is that right?

A. No, sir, I would look at the curve because of the other factors. You have a little sharp wave just above it—before it, and it is bound to have an effect on what the gage height is at the time this was taken. Measure it from where it was shown on the curve.

Q. Tell me what elevation Marmet gage actually attained after the flow had been increased 4,100 second-feet.

A. According to the chart, it rose to 565.35.

Q. That would be very close to the sum of the first elevation, 564.2, that you gave me, plus 1.2 rise you found for the

2877 increased flow of 4,100 second feet; that is, the total would be 565.4?

A. It is approximately that, a little bit less.

Q. Tell me what was the minimum power load at Marmet power station at the end of the test period.

A. At Marmet power station?

Q. Yes.

A. Your curve indicates that it actually fell to about 2,000 k.w., but all the way down, you are putting your load in and out and popping it up and down and immediately after that you are popping it back to three and then you pop it back to two again.

Q. It shows two k.w.'s as a minimum?

A. Yes, sir.

Q. Is that that load less by 1,000 k.w. than the load corresponding to that base flow at noon, August 14th.

A. Yes, sir.

By Mr. JACKSON:

Q. And what do you find to be the discharge from the Marmet power station corresponding to the load of 2,000 k.w.?

A. Measured on what?

Q. In any way that you know, if you know.

A. You have to reduce that to discharge.

Q. Do you know how?

A. Yes, I know how they do it. What do you say it was? I will accept it; it does not enter into this problem exactly.

Q. Do you think 1,200 second feet is about right?

A. You can draw it if you want. It does not affect it materially.

Q. Are you willing to accept 1,200 second-feet as about right?

A. Something like that.

Q. According to your Exhibit 117-B, what pool elevation in No. 6, at No. 6 dam, would you expect for a discharge 2878 of 1,200 second-feet?

A. No. 6 pool, at No. 6 dam?

Q. Yes.

A. What elevation would I expect there?

Q. Yes; look at your exhibit 117-B.

A. Yes; I see, but, before I could measure this Exhibit 117-B right, I have to know what factors are affecting the heights at that particular time. You popped a little load up just before, and I can't accurately measure on here unless I put in an analytical study of it like I have on this; but, if it were actually that, and no other factor, if you take 1,800 feet——

Q. (Interposing.) 1,200 feet?

A. It would be at an elevation of about 563.2, or something like that.

A. I would like to have defendant's counsel correct his statement that these are not justified by facts. Furthermore, I did not make a lot of general categorical statements. I simply read what was written on the curve.

By Mr. Jackson:

Q. Now, taking into consideration the base flow of 1,800 and the increase of 4,100, the maximum discharge at Marmet was 5,900 second-feet; what was the flow at the peak of the wave—5,900 under those conditions?

A. I would like to repeat, the Kanawha Falls gage indicates 3,200 second-feet per day; that should be taken at a base flow for the problem instead of what otherwise happened to be measured at that time, and then add 4,100 cubic feet per second and you have 7,300 cubic feet per second.

Q. All right; I take the 7,300 second-feet: Now, cutting down the 1,200 second-feet, which we agreed was the discharge corresponding to the power production at the end of the tests; what elevation would you have at the same gage?

A. Where am I going to measure it from?

2879 Q. At the same gage?

A. You can't use the rating curve for measuring the height you are going to have for a certain discharge at the end of the measurement. This thing very clearly shows that you had the force of gravity and the force of momentum or volume forcing it down for 20 hours, and it actually dropped below in the average during the falling stage 1.1 below the point of rest, and, of course, you can't measure the discharge at that particular time; but, if you will look on the hydrograph, you will see what it is.

Q. All right. Is there any time at the end of the test when you found the upper end of pool No. 6 lower than the lower end of that pool?

A. No; according to the data from the Engineers Office and that the lock-master has given to me, it was about 17 hundredths of a foot above the water at the crest of No. 6 dam.

Q. Well, it is obvious, isn't it, Col. Watkins, that if at a given time you had a flow at a given point, for instance below the Marmet power station, of 5,000 second-feet, and at a later time you had a flow of 3,000 second-feet, you would expect a lower water elevation with the lower flow, wouldn't you, at the same point?

A. You would expect a low elevation for the same flow if there were not other factors which came in and kept it from being that.

Q. In general, a reduction of flow at a given point will mean a reduction in elevation?

A. It reduces the expected point of rest.

Q. A reduction in flow at a given point will mean a reduced elevation of water at that point, will it not?

A. It means just as I said, the effective point of rest will be——

Q. (Interposing.) I am not asking about a point of 2880 rest, but I asked you whether or not, if you reduced the flow at a given point, if you do not expect the elevation of water will be reduced?

A. Yes.

Q. And if you increase the flow at a given point, you will expect the elevation to rise, will you not?

A. Yes.

Q. That is all.

A. May I add that before you can actually determine where it will be, you have got to look at the other factors, because this problem shows it just as clearly as night from day.

2881 H. G. Gerdes, recalled, testified in rebuttal as follows:

By Mr. Gatchell:

Q. Mr. Gerdes, Mr. Yarbro testified that each one of the pictures in Exhibit 592 fairly and accurately portrayed the situation described in the legend at the bottom of the picture; will you briefly tell the Court if that statement is correct?

A. That statement is not correct.

Q. Will you please explain very briefly what you mean by that?

Mr. Jackson. I move to strike out the first general statement.

The Court. I will let it stay in.

Mr. Jackson. Exception.

Q. Will you examine the photographs at Wylie's Falls?

A. I have examined those.

Q. Will you tell the Court if those pictures, or first, how many pictures show Wylie's Falls?

A. Three.

Q. What are the numbers?

A. Nos. 106, 107 and 108.

Q. Do those three pictures fairly portray the shoals at Wylie's Falls?

By Mr. Jackson. I object to that. The pictures show, #106 "View of Wylie's Falls from left bank, June 1, 1936"; #107 "View of Wylie's Falls from right bank, June 29, 1936"; #108 "View of Wylie's Falls from right bank, June 29, 1936," overlaps Picture #107. I think all the witness may be asked is whether or not he is prepared to testify those pictures do not accurately represent the scene that met the eye at the place indicated in the photographs on the dates indicated.

By the Court. He may answer.

By Mr. Jackson. Exception.

A. These three pictures while taken from both banks, looking at Wylie's Falls, are nevertheless so taken that a significant part of Wylie's Falls is omitted from all three views. It should be possible, in my opinion, in three pictures to cover the Falls and show all of them. The navigation channel dug by the U. S. Engineers is not shown in any of the three pictures, although it is situated at the Falls, at the right bank of the river.

Q. Is it discernible from the place at which these pictures were taken?

A. To one who has been at Wylie's Falls and knows where the navigation channel is it may be identified on photograph #106 and #108, although to one who has not spent sometime on the ground at Wylie's Falls it would certainly be impossible to recognize it.

By Mr. Jackson. I move to strike out all the witness' testimony. He first testified it doesn't represent the scene [illegible] show the channel, and now he undertakes to point out the navigation chute is shown by two other pictures.

By the Court. The answer may stand.

By Mr. Jackson. Exception.

By Mr. Gatchell:

2882 Q. I show you Defendant's Exhibit #555, photographs taken by T. A. Patton. Mr. Patton testified that these photographs fairly portray the situation at the time and place mentioned, at the bottom of each picture. Have you examined those?

A. I have.

Q. Are his statements correct?

By Mr. Jackson. I would like to ask a qualifying question. Mr. Gerdes, were you present at the time and place indicated by these photographs, when the photographs were taken?

A. I have been present at the places but not at the times mentioned.

By Mr. Jackson. I object to the question. Obviously he doesn't know anything about the scene that met the eye when the pictures were taken.

A. That is not correct.

Q. Will you explain to the Court what you mean?

A. Referring to photographs 114 and 115, which are again two view of Wylie's Falls, neither photograph shows the navigation channel at the right bank at the end of the Falls in such a way that it can be recognized or identified by one not otherwise familiar with the site. The remainder of the photographs, some of them [interrupted]. Some of them fairly represent the river——

By Mr. Jackson. What is the question pending, may I ask?

By Mr. Gatchell. Whether Mr. Patton's statement these photographs fairly portray the situation is correct.

By Mr. Jackson. His testimony is this, that these photographs fairly show the scene that met the eye when the photographs were taken. If this witness is prepared to rebut that, all right.

A. Some of the photographs represent fairly the scene which they purport to show.

By Mr. Gatchell:

Q. On page 5182 of the record, the witness Patton testified that
these photographs contained in Exhibit 555 which I have
2883 handed you were taken on September 29, 1930, and can you
inform the Court as to the condition of the river, the discharge in the river at that time?

By Mr. Jackson. I object to that as not in rebuttal of anything.

By the Court. I think he may answer that.

By Mr. Gatchell:

Q. Will you give us the stream flow?

A. The river flow at the time these photographs were taken was extremely low, the discharge being somewhere between one-half and two-thirds of ordinary low water. At Wylie's Falls the interpolated discharge was 1,200 cubic feet per second and at Bull Falls 1,260 cubic feet per second and at the location of Photograph No. 126, which is the lowermost one of the group, one thousand three hundred cubic feet per second.

Q. I show you defendant's exhibit 554. Have you examined those pictures?

A. I have.

Q. The witness Slocum, who introduced these pictures testified that they were taken in November 1931. Can you give the stream flow at the time those pictures were taken?

A. I can.

Q. Will you give it, please?

A. The stream flow during the time these photographs were taken was also very low, being between a half and two-thirds of low water.

By Mr. Jackson. I object to the characterization. He is asked to give what it was, and I think that is what he should do.

A. The interpolated discharge at Foster Falls, that is, interpolated between the U. S. G. S. Gaging points along the river—the interpolated discharge at Foster Falls was either 700 or 760 cubic feet per second, depending upon whether the date was the 4th or the 26th, it not being stated by Mr. Slocum on which of the two dates the individual photographs were taken. At Allisonia, at

Photograph No. 18, the discharge as interpolated would be 1,030 second feet, that being for the date of the fifth of November, and at Photograph No. 46, at Radford, 920 second feet if taken on the 6th or 1,050 if taken on the 24th, these being very close together, and at the last photograph of the group, one mile above Eggleston, 1,140 cubic feet per second.

By Mr. **Jackson**:

Q. What date was that?

2884 A. November 6th.

By Mr. **Gatchell**:

Q. Is that the normal flow of New River at that time?

By Mr. **Jackson**. I object to that as not proper rebuttal, going into the question of the normal flow.

By the **Court**. He can answer it.

A. No, that is a little more than half of the ordinary summer low water at New River.

2885 **H. G. Gerdes**

Rebuttal—Direct examination by Mr. **Gatchell**:

Q. Prof. Thomas testified that the pool fluctuations shown on Government Exhibit 229 were caused by variations of the load at Marmet and other stations. When you introduced the exhibit, did you testify as to the causes of these oscillations shown on Government Exhibit 229?

A. I did not.

Q. I show you Government Exhibit 229 and ask you what that shows as to the causes of the fluctuations regarding which you did testify?

By Mr. **Jackson**. I object to that. He is asking him now to repeat his testimony.

By the **Court**. He may answer.

A. I have reference particularly to the oscillations in the Marmet pool following the reduction in load on the London Power Plant, which started at about 4 p. m. on June 16, 1936, and continued through five successive alternate risings and fallings of the water at the two ends of the Marmet pool with a gradually dimishing amplitude, the pool finally coming to a steady state at about 8 p. m. on that evening. The power plant records showed that at that time both London and Marmet plants were operating with relatively little fluctuation in load, which, together with the observed facts of these rhythmic and opposite fluctuations at the two ends of the Marmet pool, make the fact that it must have been caused by the oscillation of the pool as it settled down to a steady state after having taken a part of the load off of the power plant; that is, the water surface, on a slope oscillated back and forth five times, before it finally settled down to a new smaller slope.

By Mr. GATCHELL:

Q. Prof. Thomas compared the hydrograph of the 1930 wave tests in exhibit 141 to show that the typical wave illustrated on his Exhibit No. 594 would be reduced in amplitude from 9,000 c. f. s. to 3,500 c. f. s. betewen Radford and Kanawha Falls. Have you studied the comparison which he made in this connection and found any errors in it?

2886 A. I have studied it and I have found that it is incorrect.

Q. Will you explain that statement?

A. I studied the comparison made by Prof. Thomas which rested upon the 1930 wave tests, as shown on Exhibit 141, and the other hydrographs of that test, and came to the conclusion that his interpretation or his findings were in error and I have embodied my study in a diagram on which I have platted the persistence in amplitude from Radford to Lock #2 of all of the 1930 wave tests against the amplitude of those waves at Radford.

By Mr. JACKSON. Has it been offered in evidence yet?

By Mr. GATCHELL. I offer this in evidence, Your Honor.

By Mr. JACKSON. I object, because it appears from a mere inspection that it is nothing more than an attempt to interpret again the 1930 wave tests as to which the Government has gone into exhaustive detail on direct, and it is a mere attempt, in a subterfuge, in rebuttal, to re-state their case. Certainly they have described at great length by Mr. Kramer, Col. Watkins, Mr. McWhorter and Mr. Gerdes, what they thought about these wave tests on their main case and now they want to interpret them again.

By Mr. GATCHELL. Your Honor this is, on its face, simply an analysis of the persistence in amplitude of all waves in the March, 1930 wave tests upon which Prof. Thomas based his comparison as to the persistence in amplitude of his typical wave that he illustrated on his Exhibit 594. Now, all that we are attempting to do is to see if his comparison was based upon a sound premise. If it was, then, of course, his testimony is entitled to some weight. If it was not, then we think we are entitled to show that.

By the COURT. I don't think that is what you are doing. If the witness is able to point out certain conditions or assumptions made by Prof. Thomas, which, in his opinion, were erroneous, he may be permitted to do that. I don't understand that is what you are undertaking to do. So far the witness has contented himself by saying that Prof. Thomas' calculations and conclusions are erroneous and then undertaking by a chart to reiterate testimony that he himself has previously given in chief and other witnesses have given in substance also.

By Mr. JACKSON. An attempt to reinterpret these 1930 wave tests which they have done repeatedly on their direct testimony.

By Mr. GATCHELL. On examination in chief this witness testified regarding two waves, Nos. 4 and 10, and Prof. Thomas said those waves were not typical and he took other waves. We are simply saying instead of having all this discussion as to whether certain waves are typical and other waves are typical, let us examine the whole 1930 wave tests, a test which was carried out under the entire control of the defendant. Their engineer was in charge of it and had control of the whole thing. All that we are saying is that Prof. Thomas based his comparison upon an inaccurate premise.

By the COURT. Ask him what that was. I let Col. Watkins be examined on the same line where he undertook to point out what he said were erroneous premises, on which some other witness based conclusions.

By Mr. JACKSON. May I make this observation: It is a subterfuge to have this witness put in a new interpretation of these 1930 wave tests that they have interpreted three or four times on direct, and if their interpretation is right, and Prof. Thomas' is different, then obviously there is something wrong with his premise, but I don't think that they can come in and go over their testimony again on the 1930 wave tests.

By the COURT. I understand that. If, for instance, we have a conflicting interpretation regarding these wave tests and this witness can say "I will show you why there is a conflict, because the witness Thomas took certain erroneous conclusions or made erroneous assumptions, which I can point out to you to show wherein he was in error." I think that would be proper rebuttal, and that is what I am confining them to.

By Mr. GATCHELL:

Q. Will you tell the Court what this chart represents?

By Mr. JACKSON. I object to that.

A. This chart represents, to the best of my ability, the relation between the 1930 wave tests upon which Prof. Thomas based his estimates, and the estimates of Prof. Thomas which he said are based upon those tests. There is shown here, platted on the height scale the persistence in amplitude from Radford to Lock #2 of each wave of the 1930 tests, that is, the ratio of how high the wave was at the end of the run as a percentage of its height at the beginning. On the horizontal scale there is shown the amplitude at Radford, that is, the height of each wave at the beginning, and each point thus represents the relative strength of the wave at the end of the run at Lock #2, platted against its height at the beginning. I have taken it to be a common sense proposition that the bigger a wave is—that in any given channel, the bigger a wave is at the start, the bigger it will be at some given distance down that channel, and I have sought in this diagram to show how the waves of the 1930 tests conform to that common sense, simple idea, and, in so doing, point out that the estimates that Prof. Thomas has made, based upon the same data and arrived at by more complicated means, appear to me to be in error.

By the COURT:

Q. Mr. Gerdes, isn't all of this computation about the 2887 results of these wave tests exactly what the Government introduced at great length in chief, or they had abundant opportunity to introduce?

A. No, sir; I do not believe that it is.

By the COURT. I have said two or three times if he can pick out premises or conditions which the other witness used in this calculation and point out where they are erroneous, he may do so, but that isn't what you are trying to do. You are trying to utilize that to open up this whole subject of wave tests and evidence that would reiterate what he has previously testified to, and any number of other witnesses have testified to in chief, or which they have certainly had an abundant opportunity to testify to.

By Mr. GATCHELL. Your Honor, we certainly don't want to open up the 1930 wave tests again, and at the time Prof. Thomas was on, he discussed two or three of these waves. Obviously, Your Honor, the entire series of tests should be a more accurate representation than a few waves picked out at random. All that we are asking this witness is if he can show us wherein the premise of Prof. Thomas was erroneous.

By the COURT. All right, wherein was the premise of Prof. Thomas erroneous?

My Mr. GATCHELL:

Q. Can you answer that question?

A. I can. Prof. Thomas used the 1930 wave tests to build and calibrate his model, from which he drew his conclusions, that is, the waves themselves, and, among other things, principally their amplitude, were the premise. I have here platted——

By the COURT:

Q. Where was he wrong in doing that? What was erroneous in using the 1930 wave tests as a basis for his calculations?

A. There was nothing wrong in that.

Q. Where else did he err?

A. The error came in in the way in which he used them.

Q. How did he err in the way in which he used them?

A. By using them in a model which gave erroneous results, which error I have here demonstrated. There are a number of possible deficiencies in the model which might have led to this erroneous result. I did not think it proper to endeavor to follow Prof. Thomas through all of the operations of his model.

By Mr. **Jackson**. I move to strike out the testimony so far. It is obviously nothing more than an attempt to reiterate what was covered before.

By the **Court**. It looks like it to me.

A. The point of the diagram is——

By Mr. **Jackson**. One moment.

By the **Court**. Go ahead.

A. The whole point of this diagram is that these waves indicate a general trend, that is, they follow in general—although there are many minor complications which have been brought up—a simple rule. That rule points to a definite amplitude for the wave of the size which will be emitted by the Radford power plant.

By the **Court**. I think you have gone far enough.

No, gentlemen, I can't admit that.

By Mr. **Gatchell**. Your Honor, may we have an exception to your exclusion of this testimony and say, were this witness permitted to testify, he would show that from the 1930 wave tests used by Prof. Thomas as the basis upon which he compared the persistence in amplitude of his typical wave shown in Defendant's Exhibit 594, that this witness would say that the 1930 waves show that the larger the wave passing Radford, the greater is the percentage of persistence of the amplitude of that wave at the time it reaches Kanawha Falls.

By the **Court**. Mr. Gatchell, in your avowal, and in some of your questions, you injected something about the tests made by Mr. Thomas, carrying the implication that you were in position to point out where his tests were erroneous. This very avowal would carry that implication because you make some reference to Prof. Thomas' results obtained and that carries the implication that you can point out some erroneous basis for his conclusion. I have invited you a half dozen times and asked the witness to point out anything of that sort, if he can, and the witness hasn't done that and wishes to go off into a general discussion of the wave tests, giving his conclusions about it, pointing out no error in Prof. Thomas' method of computation except to say that he has another method by which he reached a different conclusion. Any time you can point out, as I allowed Col. Watkins to point out, any supposed errors, fallacious conditions, upon which conclusions were reached by defendant's witnesses, you may do so, but I will not let this witness say that witness Thomas expressed certain views and reached certain conclusions and we now want to point out those as being erroneous by showing we reached a different conclusion in a different way. That was something you undertook to do in chief and certainly had abundant opportunity to do.

A. I believe the error in Prof. Thomas' methods and apparatus to be the way in which he calibrated his so-called integrating model, which is another way of saying approximating model. He calibrated that from the 1930 wave tests in such a manner that if it were calibrated in a certain manner on this distorted scale it would give distorted results. I believe that would be one factor. Another one, I believe to be the microscopic scale of his model which renders it highly unlikely that accurate results could be obtained.

By Mr. Gatchell:

Q. Can you tell the Court then the distortion in the integrating model?

By Mr. Jackson. Are you going to offer evidence now that the scale of the integrating model was different than Prof. Thomas gave?

By Mr. Gatchell. To simply show the distortion in Prof. Thomas' integrating model.

By Mr. Jackson. Prof. Thomas gave the scale of his model and exactly what it is in every way and unless this witness is prepared now to say that he knows that is false or untrue——

By the Court. But if the witness can point out where a model, made to the scale described, would produce certain inaccurate results, I think he is entitled to do that.

A. Well, this integrating model is an approximate device which consists of a condensed representation of a short piece of river which is set up and adjusted repeatedly so as to give at the four or five places for which there are data which are selected so that when a wave, possessing the characteristics of one which it is desired to repeat, say one of the 1930 waves, is passed through the model and makes the right shape at the first station on the model, then the succeeding stations on the model are adjusted so that it gives an answer at those stations corresponding to the shape of the 1930 wave. That is a matter of successive adjustment and balance and the chances for error in the model due to the non-representation of the river between these stations and the small scale of the model, are such as to render it unlikely that when a wave, possessing some different characteristics and being considerably larger than the waves which were used to calibrate the model, is run through it, an accurate result would be obtained, and as I have tried to show by this diagram here, apparently an accurate result has not been obtained.

By Mr. **Gatchell**:

Q. Do these 1930 wave tests show that the small waves have as high a percentage of persistence as the larger waves passing Radford?

A. They do not.

By Mr. **Jackson**. I move to strike out the answer and I object because that is clearly going into their case in chief again.

By Mr. **Gatchell**:

Q. Professor Thomas testified that his typical Radford wave, shown on Exhibit 594, would decrease in amplitude from 2889 9,000 second feet at Radford, to 3500 second feet at Kanawha Falls. Have you found any errors in the premises upon which this conclusion is based?

A. Professor Thomas said that in the determination of the persistency of the waves from Radford to Kanawha Falls, he used an integrating model and that he checked the accuracy of the results obtained from the model by his study of the 1930 waves. In making a check of the 1930 waves, to determine if the premises of Professor Thomas was sound, I found that the facts as to the 1930 waves did not support his conclusion, and these facts are:

That the 1930 wave tests show that the larger the wave passed Radford, the greater the persistence in amplitude at Lock 2.

By Mr. **Jackson**. That is simply a method by counsel to circumvent the ruling of the Court this morning. He is undertaking to testify that the waves show certain results as to amplitude. What the decrease was was given by Mr. McWhorter and Mr. Watkins and another witness, and I think by this witness also, but I am not certain whether or not this witness did, but certainly they had an opportunity to testify as to what happened to every wave, and now he is seeking to restate it.

By the **Court**:

Q. What are the erroneous premises he adopted?

A. The erroneous premises that he adopted with the 1930 wave tests, was that larger waves have smaller percentage of persistencies.

By Mr. **Jackson**. Will you point to the transcript of the evidence here where that testimony occurs, Mr. Gatchell.

By Mr. **Gatchell**. On page 5732, Your Honor, Professor Thomas was asked [reading.]

"Q. Professor Thomas, in your opinion, what would be the amplitude of a power tide emitted from the Radford station in the form and volume shown on Exhibit 594, when it reached Kanawha Falls?"

By Mr. **Gatchell**. And his answer was as follows: [Reading.]

"A. In my opinion, the amplitude of such a tide would be approximately 3,500 second-feet."

By Mr. GATCHELL (continuing). You will have to go through the whole testimony of Professor Thomas to get the other facts upon which he based this conclusion and the premises he used.

By the COURT. The objection will be SUSTAINED.

By Mr. GATCHELL. Will your Honor grant us an exception to the ruling of the Court on that?

By the COURT. Yes, sir.

By Mr. GATCHELL:

Q. Mr. Gerdes, Professor Thomas said that the power waves would be observed by routine variation in pool levels on the Kanawha River. Is this opinion borne out by the evidence—I mean by the facts?

A. No, it is not.

By Mr. JACKSON. We object to the form of the question—"is this opinion borne out by the facts". That is a conclusion that the Court will draw.

By the COURT. Let it stand.

By Mr. GATCHELL:

Q. What are the facts?

A. The observed fact on the Kanawha River is that the power wave shown on Government Exhibit No. 229, created at the London power plant June 16th, 1936, traveled down the Kanawha River practically undiminished over five dams to the Ohio River.

By the COURT. What wave is it?

By Mr. GATCHELL. Any waves. I beg your pardon. I asked if the conclusion was borne out by the facts, and here is actual evidence that the power wave moved from the London tail race through Lock 11."

By the COURT. Mr. Thomas spoke of waves originating at Radford, and expressed the opinion that they would be ironed out going through the various pools. If you had some man to come in and testify that he is a lock-master near the mouth of the Kanawha River, and that these waves originated up the river and were apparently perceptible there, I might let him testify to that. You are trying to re-open the whole question of the waves by going out and getting some records from some lock masters. If we reopened this, we would not have these men here with the data, subject to cross-examination, and could not check the accuracy of the data or the conditions of the river at that time. I will not start that at this stage of this case.

By Mr. GATCHELL. Exhibit No. 229 was introduced before and certain errors testified to or were brought out on cross-examination. Please mark this Government Exhibit No. 229–a. [Indicating.]

The foregoing exhibit was so marked.

By Mr. Gatchell:

Q. Mr. Gerdes, I show you Government Exhibit No. 229–a, entitled "Automatic gage record, London and Marmet, June 15th to 19th, 1936, and ask you if this is similar to the original Government Exhibit No. 229?

A. Yes, sir.

2890 Q. Does it show corrections made on Government Exhibit No. 229–a?

A. Yes, sir.

Q. What corrections are shown [handing paper to the witness].

A. Following the testimony of Colonel Scheidenholm to the effect that there were errors noted in Government Exhibit No. 229, I rechecked the Exhibit and found it to be correct, with the exception of the lower graph, which is the reading at the upper end of Dam No. 6 pool. On rechecking it, it was found that the lower horizontal lines, forming part of these records, represented a place where the gage had evidently become fastened, and had not recorded the entire fluctuation in the water surface at Marmet on those days—the fluctuation actually being about 3½ feet.

By Mr. Jackson:

Q. What are you doing—correcting it?

A. About 2.6 feet, instead of 1.8 feet, as previously shown. This correct line has been plotted from the lock master's report on the Marmet dam.

By Mr. Gatchell. We will ask to have this Exhibit marked as Government Exhibit No. 230–a.

I offer this corrected Government Exhibit No. 229–a.

(Said exhibit is marked as indicated.)

By Mr. Gatchell;

Q. Mr. Gerdes, I show you a paper, marked Exhibit for the Government, No. 230–a, Profile of Water Surface, June 16th, 1936, and ask you if that is similar to the original Government Exhibit No. 230?

A. Yes, sir.

Q. Does it have any differences, and if so, what are they?

A. Following similar testimony regarding this chart—the errors in it—in this graph—it was rechecked and found to be entirely correct, with the exception of five entirely minor and inconsequential errors that I show here corrected to indicate their magnitude.

By Mr. GATCHELL. I offer Government Exhibit No. 230-A, in evidence.

(Said exhibit is filed and marked as indicated.)

By Mr. GATCHELL:

Q. Now, Mr. Gerdes, can you tell us if the Bluestone project is under construction?

2891 A. It is not; I was there last on July 21st, and there was no construction; no construction work in progress there.

Cross examination by Mr. JACKSON:

Q. In Exhibit 229-A, where you undertook to correct your errors in the original Exhibit 229, did you shift from that gage to any other in the bottom of the graph?

A. The corrected line is shown plotted from the lockmaster's report, which refers to lower gage which is on the other side of the river from the upper gage, a distance of approximately 500 feet.

Q. Did you use a different gage?

A. Yes; but the two are situated at the same point on the river, and should give, within close limits, the same reading.

Q. The old line on Exhibit 229 is still not plotted according to the gage, is it?

A. I believe it is.

Q. Did you change it from the way it was on the other?

A. No.

Q. Will you refer to the gage chart and see if the statement is true?

A. Will it be satisfactory if I refer to copy of the original Exhibit 229?

Q. For the purpose of showing errors.

A. I will refer to the gage chart. I do not fully understand your question.

Q. Mr. Gerdes, you stated that you had found some error in calibrating the integrating model used by Professor Thomas; briefly, what was that error?

A. I stated I found an error in the premises taken by Professor Thomas.

2892 Q. Do you claim to have found any error in calibrating the integrating model by Professor Thomas?

A. I found his results to be inaccurate in his work.

Q. Is that since his results from the integrating model do not agree with the opinion you previously expressed, you concluded that there was an error in calibrating?

A. Since his testimony indicated that his results were partially predicated on the use of the integrating model, I found it did not lead to the conclusion that might be assumed that it is likely the error might be in the model.

Q. That is all the basis you had for making the positive statement that you discovered an error in calibrating his model?

A. I said the error I found might very likely occur, or would very logically have been in either the calibrating or microscopic scale.

Q. As a matter of fact, you do not know anything about the precise calibration of Professor Thomas' model, do you?

A. Yes; I think I do.

Q. You never saw it?

A. No. I have used similar models, and I am familiar with that sort of work.

Q. It is your testimony that you have made integrating models of the kind that Professor Thomas used?

A. Yes.

Q. Where did you make one?

A. At the University of California.

Q. When.

A. In 1930.

Q. Were you employed there at that time?

A. No; I was employed by the United States Engineering Department.

2893. Q. And you were working there?

A. Yes.

Q. Who was in charge of that?

A. Professor Morrough O'Brien.

Q. That was in 1930?

A. That is right.

Q. Did you say the Bluestone project was under way?

A. I said the Bluestone project was not under construction on July 21, 1936.

2894 By Mr. THOMPSON. Now I would like to offer in evidence a document submitted to the Circuit Court of Appeals, in the case of the Appalachian Electric Power Company v. George Otis Smith, et al., and also before Mr. Justice Way, when we argued the case before him, which is a photostatic copy of a letter signed by George Otis Smith, addressed to me, and dated April 8, 1932. I would like to read that letter into the record.

By the COURT. What is it about?

By Mr. THOMPSON. That letter has to do with the question of having searched the records of the Federal Power Commission to find out whether there was any authority of the Commission for the signing and sending of the letter by the Secretary of War to the Attorney General. I called your Honor's attention at the time, when the letter was admitted, to the fact I would bring this letter before your Honor.

By Mr. Jackson. I object to his as an incompetent method of proof and something gotten up by counsel for the purpose of this litigation.

By Mr. Thompson. Not this litigation.

By Mr. Jackson. And not received in any Court. When counsel says received in Court he means he merely brought it there and it never became a part of any record.

By Mr. Thompson. I must contradict everything being said by counsel. [Letter handed to the Court to read.] Your Honor will remember that the minutes of the meeting of the Commission said that twice there was an attempt to have this matter referred to the Attorney General, and the Commission voted it down both times, then the letter was sent by Secretary Hurley, who was Acting Chairman, and this letter shows the searching by George Otis Smith (then the Chairman of the Commission), of the record to find whether there was any authority, and the letter speaks for itself.

By the Court. In other words, Smith looked through the records to see if he could find any place where the Commission had formally adopted a resolution inviting the opinion of the Attorney General, and didn't find any.

2895 By Mr. Thompson. It wasn't in the form of a resolution, but he searched the records to find if any authority by the Commission—resolution is probably the better word.

By Mr. Jackson. I don't think Mr. Smith if produced as a witness would undertake to say anything like that, but if any proof is to be made, he should be produced.

By the Court. You may put it in.

By Mr. Jackson. May our exception be noted, because wholly incompetent and not in rebuttal.

By the Court. Yes, sir.

By Mr. Thompson. This letter then goes in evidence as Government Exhibit #272. (Letter marked and filed Government Exhibit #272.)

Your Honor we want permission to file after the close of the case three licenses. They are recited in the appendix we had in the other case. We sent for them and had certified copies sent down here, but we have lost them, at least I cannot locate them now. They have to do with a license to construct a highway bridge July 28, 1928 at Cotton Hill Station, West Virginia, five miles above the mouth of New River; and another one October 16, 1926, a highway bridge at Stone Cliff, West Virginia, 28 miles above the mouth of New River, and August 29, 1927 a highway toll bridge at Hinton, West Virginia, sixty-six miles above the mouth of New River.

By Mr. **Jackson**. We object to them as not in rebuttal of anything.

By Mr. **Thompson**. We asked at the time when we closed our case for permission in the event we could not find some of these exhibits, for permission to put them in and I understood you gave us that permission.

By Mr. **Jackson**. We object to them further on the ground they are immaterial and irrelevant.

By the **Court**. Objection overruled.

By Mr. **Jackson**. Exception.

By Mr. **Gatchell**. Your Honor, you will recall that we had an understanding about the aerial photographs which had been taken at the direction of the Federal Power Commission. It seems upon consulting with counsel for defendant there is some misunderstanding with respect to the actual book we desire to introduce as an exhibit, and they have asked us to introduce instead of the actual book we had, a smaller copy.

By Mr. **Jackson**. We asked you to introduce the actual book you had, and the actual book you gave to us, instead of a new one we didn't know anything about until last night.

By Mr. **Gatchell**. I said there was some misunderstanding as to what was offered.

By Mr. **Jackson**. No misunderstanding as to the actual book.

By Mr. **Gatchell**. Therefore we ask permission to introduce these aerial photographs with the understanding we will withdraw them to substitute legends more acceptable to counsel for the defendant, and as they seem to think we have improper legends, we will submit the legends to them to see if they agree with what we think is proper, and also some matter appearing in the beginning of the volume which will be omitted, if that is satisfactory.

By Mr. **Jackson**. That is agreeable. The one attempted to be offered in the Court of Appeals had a lot of testimony on it and that was to be changed.

(Note.—Book of aerial photographs marked as Government Exhibit No. 273.)

2896 By Mr. **Aiken**. For the purpose of clarifying the record in regard to the status of certain Government exhibits, offered in connection with the testimony of Col. Edgerton, I desire to re-offer for all purposes at this time the following Government exhibits. I will make this in the form of a blanket offer in as much as counsel for defendant intimated there was no objection to the re-offering for all purposes of the following Government exhibits:

#88, being the Declaration of Intention.

#89—Assignment of the Declaration of Intention.

#102—The letter transmitting the Assignment of Declaration of Intention.

#90—The application for license.

#90-a—Maps accompanying application for license.

#92—The First Taylor report, dated August 20, 1925.

#93—The underlying reports of the Divison and District Engineers to Exhibit #92.

#96—Letter from General Deakyne dated July 23, 1926.

#98—Report of General Deakyne dated April 12, 1927.

By Mr. Jackson. We have no objection to the exhibits being received so far as they have been read by Mr. Aiken with this understanding, which I understand to be supported by the record, for instance, I think the report of General Taylor of August 20, 1925, is open to consideration for whatever it might be worth. It is an official report and entitled to be considered for whatever it is worth, but I make that concession upon the understanding the same treatment is accorded to the report of General Taylor of December 25, 1929. I merely want to make that clear, our position being where there is an official report that is germane and made in the regular duties of the officer, it is open to the consideration of the Court for whatever it might be worth, although some parts may not be accepted as evidentiary.

2897 By Mr. Aiken. I understand that is the status of these various official reports in the record, such as the Taylor report of December 29, 1925, offered by the Defendant.

We desire in addition thereto to reoffer for all purposes Government Exhibit #94, being the report to Col. Edgerton, Chief of Engineers of the Federal Power Commission, by Major Trippe, dated October 14, 1925. I understand that counsel for the defendant objects to this report on the theory or for the reason this report made by Major Trippe to Col. Edgerton is not an official report, in that it did not pass through regular channels into the office of the Chief of Engineers, War Department. Now the record discloses that Col. Edgerton testified that Major Trippe was acting as field representative for the Federal Power Commission and this report was made to him direct upon his request and we feel it should be received as your Honor has received various exhibits on the part of the defendant, these various reports, made by subordinates. For instance the report of Col. Spaulding. We feel in view of the testimony of Col. Edgerton that this report was by Major Trippe directly to him as the field representative of the Federal Power Commission, and has as much dignity as if it had gone through the office of the Division Engineer and into the office of the Chief of Engineers and thence to the Federal Power Commission.

By Mr. JACKSON. The report was simply a letter written by Major Trippe to Col. Edgerton saying he was down there and didn't have time to talk with him, and for him to write him. It was purely an informal matter. I think governmental matters were not handled in that way.

By the COURT. For what purpose is it in?

By Mr. JACKSON. For showing what was before the Federal Power Commission.

By Mr. AIKEN. I do not know whether your Honor recalls
2898 just what the import of this report was. It was a report
as to the effect, or what the anticipated effect of the Radford project on navigation on the Kanawha River would be, and expressed the opinion of Major Trippe it would adversely affect navigation.

By the COURT. Was Major Trippe here?

By Mr. AIKEN. Yes, sir.

By the COURT. I will exclude that except for the purpose for which it has already been admitted.

By Mr. AIKEN. Exception.

There are four additional Government exhibits I wish to reoffer for all purposes which fall in the same category, and for that reason I shall offer them all at once.

Exhibit #95, being report of Mr. Kramer on his studies of waves on the Pit River.

#103, 104 and 105, which are similar reports of wave studies on the Pit and Klamath river. Your Honor excluded evidence of the same nature when Mr. Kramer was on the stand, on the ground that he would not be permitted to testify about any conditions on rivers other than New River. We felt at the time Mr. Kramer's comparison of the two rivers and his knowledge of the Pit and Klamath was such as to permit this evidence to be received, and we now desire to make this offer.

By Mr. JACKSON. We renew our objection. They are only in to show what was before the Commission.

By the COURT. I will confine them to the purpose for which they are in.

By Mr. AIKEN. Exception.

By Mr. JONES. (Counsel for Plaintiff.) I desire to have the record incorporate three acts of the State of Virginia.

By the COURT. Make a reference in the record to them.
2899 By Mr. JONES. An Act approved May 6, 1887, (this will
be Exhibit No. 274) incorporating the New River Steamboat Company and authorizing them to operate a steamboat on New River.

The next is an Act of February 3, 1888, of the General Assembly of Virginia, to authorize the Radford Land & Improvement Company to erect a dam across New River (marked Government

Exhibit No. 275) the concluding paragraph being pertinent: "And in the erection and maintenance of said dam, when required by the said New River Steamboat Company, after the said New River Steamboat Company has provided a steamboat for its purposes, ready for operation, then the said Radford Land & Improvement Company shall provide and maintain a suitable lock which will allow the passage of a boat of the capacity of 60 feet long by 15 feet wide. This is an Act of the General Assembly of Virginia, Section 1887–8.

By Mr. Jackson. I understand these are being received as Exhibits and I ask that our exception be noted.

By Mr. Jones. This is an Act that relates to Montgomery and Pulaski Counties. I desire to call the Court's attention to this Act, approved March 24, 1926, of the Acts of 1926: "Be it enacted by the General Assembly of Virginia that the owners of land in Montgomery and Pulaski Counties, Virginia, below the mouth of Little River, abutting on and adjacent on New River, and the owners of the coal and other minerals in and under such land, be, and they are hereby given the right and privilege of mining and removing, and of having mined and removed the coal and other minerals under New River, lying opposite their respective lands to the center of the stream, but nothing in this Act shall be construed to affect the vested rights of any citizen or citizens of Virginia, natural or artificial." This is from the Acts of Assembly 1926, page 659, being Chapter 366.

By Mr. Jackson. May our exception be noted to the receipt of this?

By Mr. Jackson. In exhibit 271 that was just offered I think it is sufficiently clear from what was read that the relator said the
attention of the Board of Public Works is especially called
2900 to the fact that in expending Federal Funds for this project,
approval of both the Federal Power Commission and the
State Corporation Commission will no doubt have to be obtained.

By the Court. That is Mr. Draper's letter.

By Mr. Jackson. In that connection, I offer in evidence from the supplemental appendix to Plaintiff's Brief in this case, Executive Order No. 6251, appearing on Pages 290 and 291 in which the President designates the Federal Power Commission as the agency to examine projects for which money is being loaned under the National Industrial Recovery Act for the Development and Utilization of electric power, regardless of where it is, and without reading it,——

By Mr. Thompson. As usual, he doesn't read it all. He left out the statement about submitting it to the Chief of Engineers.

By Mr. Jackson. Let it be copied into the record without reading it, and it may be marked Defendant's Exhibit No. 611.

Defendant's exhibit No. 611

"Executive Order No. 6251. Designating the Federal Power Commission as an agency to aid the Federal Emergency Administrator of Public Works.

Pursuant to authority vested in me by Title II of the National Industrial Recovery Act, approved June 16, 1933, I hereby designate the Federal Power Commission as an agency to aid the Federal Emergency Administration of Public Works in the preparation of that part of the comprehensive program of public works provided for in Section 202 of the Act which pertains to the development of water power and the transmission of electrical energy. As such agency, the Commission shall make a survey of the water resources, of the United States as they relate to the conservation, development, control and utilization of water power; of the relation of water power to other industries and to interstate and foreign commerce; and of the transmission of electrical energy in the United States, and its distribution to consumers, and on the basis of this survey, shall formulate a program of public works.

2900-A "2. I further authorize and direct the Commission to investigate, upon the request of the Federal Emergency Administrator of Public Works, application for loans to be made under Title II of the National Industrial Recovery Act for the construction of the public works projects which involve the development and utilization of electric power and to make recommendations with respect thereto to the Administrator.

"3. The Commission shall authority to appoint, without regard to the civil service laws, such officers, experts, and employees as it may find necessary to carry out its functions under this order, to prescribe their authorities, duties, responsibilities and tenure, and, without regard to the classification Act 1923, as amended, to fix their compensation. The Commission shall have authority also to make all necessary expenditures (including expenditures for personal services and rent at the seat of government or elsewhere, for law books and books of reference and for paper, printing, and binding).

"4. The total expenditures by the Commission in connection with its functions and duties under this order shall not exceed the sum of four hundred thousand dollars ($400,000.00).

"FRANKLIN D. ROOSEVELT.

"THE WHITE HOUSE, *August 19, 1933*."

By Mr. JACKSON. I have about five or ten minutes of rebuttal testimony.

By the COURT. From whom?

By Mr. JACKSON. Dr. Thomas.

By the COURT. I think you feel, having had him here all the time, you want to put him on the stand, and yet I don't see that there is anything he has to rebut.

By Mr. JACKSON. I am going to have him rebut the statement that he had left out something from his model, or something like that.

By Mr. THOMPSON. I object.

By Mr. JACKSON. I understood from Your Honor that we ought no to take the time of the Court.

By the COURT. I don't think so.

16

EXAMINATION AND SURVEY OF NEW RIVER FROM THE MOUTH OF GREENBRIAR, WEST VIRGINIA, TO THE LEAD MINES IN WHITE COUNTY, VIRGINIA.

UNITED STATES ENGINEER OFFICE,
BALTIMORE, MD., *December 20, 1872.*

GENERAL: The appropriation bill of June 10, 1872, for rivers and harbors, required that an examination or survey be made of New River from the mouth of the Greenbrier, in West Virginia, to the lead mines in Wythe County, Virginia.

The field work was executed in August 1872, by Mr. N. H. Hutton, assistant engineer. His preliminary report is inclosed herewith, as well as a report from Mr. C. R. Boyd, a civil engineer attached to Mr. Hutton's party, to both of which attention is recommended.

The country through which New River flows is represented as being very beautiful, fertile, and salubrious. Its mineral resources are extraordinary, its water-power admirable, and its excellence for farming and grazing purposes is admitted by all who have seen it. Such a country deserves development, and it appears that attention was very early directed to it.

A survey of 54 miles of the river between Sinking Creek and Greenbrier River was made by Moore and Briggs in 1819, under the auspices of the board of public works of the State of Virginia, with a view of connecting the waters of the James and Kanawha Rivers by that route.

Their report is interesting and instructive. They say:

"This is truly a noble river. Notwithstanding it was represented to us as being remarkably low, yet it afforded (July 1819) a superabundance of water for every purpose of internal navigation. The fall in this part of the river, considering the mountainous country it passes through, is comparatively moderate. The principal falls are the Bull Falls, McDaniel's, Anderson's, Wiley's, Neilley's, and Peter's Mountain Falls—none of which have been improved in the least degree, yet we ascended them all with our boat, though in two or three instances with considerable difficulty, after taking out our baggage, stores, &c."

It is probable the difficulty of passing their boat was due more to the rapidity of the current than to want of water. They had previously stated the draught of their boat to be 9 inches. They give an estimate of the cost of good sluice navigation of 2 feet at all times for this portion of the river, $10,400. It must be 906 remembered that this estimate was made more than fifty years ago, and should now be increased to $30,000, to acomplish the same result on the part of the river (54 miles) between Sinking Creek and Greenbrier; and to $100,000, including the portion from the lead mines to the Greenbrier, 128 miles, with the understanding that the improvement at Foster's Falls be restricted o a sluice-way and tracking-path.

But little has been done in the way of improving the river since he time of Moore and Briggs, though an effort is said to have been made in that direction by the confederate government during the ate war. Mr. Hutton states that the keelboats now used draw about 12 inches when two-thirds loaded. By the construction of slight deflectors or dams of rock and brush, both of which materials abound, the volume of the water may be concentrated and the depth over the shoals increased from the present average of about 12 inches to about 2 feet, without too much increase of velocity of current. Some of the falls, which are almost always vertical and of an average height of about 4 feet, could be greatly improved by blasting sluices through them, about 30 feet in width, and of an average length of 50 feet. It is to be observed that the falls have in many cases natural chutes or sluices through them, susceptible, also, of such improvement as that just indicated.

What has been said above refers to a keel-boat navigation, but the pressure for the improvement of this river is increased by the development of the railroads which intersect it and afford the means of rapid transport east and west for the commodities to be procured along and near the stream. There is a demand for the steam navigation.

Mr. Hutton estimates that to give depth of water of 3 feet at all seasons, would suffice for present needs, and would cost $750,000, with only so much reduction of grade at the falls and rapids as would permit small stern-wheel steamers to ascend, each with one or two barges in tow, and probably requiring at a few places that the ascent be made by hauling on ropes attached to fixed points above and to the drum of the steam-engine of the boat. The improvement contemplated in the above estimate is of the 2907 same general character as that referred to above for the 2 feet navigation, except at Foster's Falls, where a lateral canal, if steam is used, seems to be required, at least over the first fall of 18 feet in one-half mile. This canal at a single point would consume in its construction about one-third of the sum mentioned above, $750,000. It is probable that further study of the river and revision of the estimates may enable them to be reduced, at the same time demonstrating the propriety of concentrating the first efforts to improve on certain parts of the river contiguous to existing lateral outlets. Should Congress not think proper to appropriate a large sum for New River at this time, it is to be observed that the judicious use of any small sum, even a few thousand dollars, would decidedly and at once ameliorate the navigation, while the work done would be available for any further improvement to be subsequently undertaken. It is desired to revise the estimates and to make some additional studies from the maps. A supplemental report will be shortly made, with which the maps and revised estimates will be submitted.

Very respectfully, your obedient servant,

Wm. P. Craighill,
Major of Engineers.

Brigadier-General A. A. Humphreys,
Chief of Engineers, U. S. A., Washington, D. C.

Baltimore, *December, 17, 1872.*

Sir: I have the honor to submit the following preliminary report of the survey of New River, Virginia, made under your direction during last summer.

The portion of the river embraced within the limits of the survey extended from the lead mines in Wythe County to the mouth of the Greenbrier River, a distance, by the course of the river, of 128 miles.

Of this section no previous examination was known to have been made, except of the lower 54 miles, from the Greenbrier to Sinking Creek, which was surveyed and leveled by Messrs. Moore and Briggs in 1819.

2908 The party was organized and equipped at Wytheville, the county-seat of Wythe County, and about 15 miles from our starting point on New River. Operations were commenced on the 25th of July, at the dam of the Wythe Union Lead Company, and terminated on the 21st of August at the mouth of the Greenbrier River.

From the lead mines to the eighty-third mile, level and compass lines were run, determining the meanderings of the river, the slope of the water-surface, and the form and extent of the obstructions. Cross-sections of the river were also taken at frequent intervals, and an accurate topographical sketch of the valley.

At the eighty-third mile, owing to a sudden rise in the river of considerable extent (between 4 and 6 feet) which rendered the further immediate prosecution of the levels impracticable, the major portion of the party was disbanded, and the examination of the river thence to the Greenbrier was confined to a personal examination of the rapids and shoals, with topographical sketches of the country.

This course was rendered more evidently the proper one, under the circumstances, from the fact that, as before stated, this portion of the river had already been surveyed and leveled; and for the 14 miles that this survey overlapped the survey of Moore and Briggs, an almost perfect coincidence was observed to exist.

New River which forms the main body of that stream which, after the junction of the New and Gauley Rivers, is known as the Kanawha, rises in the northwestern corner of North Carolina, near the Tennessee line, and flows northeasterly through and between spurs and branches of the Blue Ridge until it reaches the initial point of this survey, at the lead mines. From this point it flows in the same general northeasterly direction, between and parallel to the main divides of the Blue Ridge and the Alleghanies, cutting alternately through spurs, from the one or the other until, in the fifty-fifth mile of the survey, at what is known as the Horseshoe, it turns abruptly to the northwest and breaks through the five ranges into which the Alleghanies are here divided, keeping the same direction to the Greenbrier, 73 miles beyond.

2909 Throughout this whole distance the valley almost always presents some level bottom-land, though nowhere except in the Horseshoe could it be considered at all extensive. The foot-hills, however, that border the river are fertile to their summits, and good timber abounds.

Commencing at the lead mines with a width of 350 feet and an average depth of 5 feet, the river gradually expands to a width of 900 feet and an average depth of 6 feet, just above the Greenbrier, subject, of course, to the occasional expansions and contractions found in all natural water courses.

On its course, between the mines and the Greenbrier, New River receives several tributaries of no inconsiderable size. Among them, in the east, are Big Reed Island and Big Stony Creeks and Little and Indian Rivers; on the west, Cripple Reed, Walker's, and Wolf Creeks and East and Blue Stone Rivers. All of these are mountain streams, furnishing from 50 to 200 cubic feet per second of water at ordinary stages.

The drainage area of the river, within the limits of the survey, amounts to 2,400 square miles.

During the time of this survey the river was in rather an unusually low condition, according to the opinion of all the residents along its borders; yet the results of slope measurements and cross-sections at various points indicated a discharge of 2,000 cubic feet per second at the lead mines, and 3,000 cubic feet above Lipford's Falls, in the sixty-second mile.

From this it will be perceived that this stream affords at all seasons an abundance of water for any scheme of navigation improvement that may be adopted.

The river in its present condition presents the usual features of mountain streams: reaches of comparatively still and deep water separated by rapids and shoals.

In the upper portion of the river, for 35 or 40 miles, the pools are generally very short, whole miles being composed of ledges of slate or limestone, 200 or 300 feet apart, with small pools between. In the lower portion, though the rapids are more concentrated, yet even there the pools will hardly average more than one mile in length.

2910 The total fall of the river from the lead mines to Greenbrier is 531 feet, or about 4¼ feet per mile—a grade that, if equally distributed throughout, would offer no impediment to such navigation as the country along the river has need of.

The obstructions to navigation are of three kinds:

Ledges over which the water falls;

Ledges that simply cut across the axis of river, without effecting any change of slope of water-surface; and

Ledges formed by bowlders and gravel brought down by freshets.

The ledges encountered along the upper half of this section of the river are almost entirely of slate, while those found for 40 miles below are of limestone, and the remainder, toward the lower end, of sandstone.

All of these deposits are distorted and upheaved to such an extent that in most of the ledges the strata are nearly vertical, and, with one or two exceptions, where trapdikes appear, will be comparatively easy of removal by blasting.

The following statement of the obstructions encountered in each mile will probably assist in forming a correct view of the difficulties to be overcome, as well as the best method of doing so. It will be understood that in each mile, except to the extent named, the river affords a good navigation and an average depth of 5 feet at low-water stages.

Commencing at the lead mines:

1st mile: Good navigation; fall, 5 feet.

2d mile: Good navigation; fall, 4 feet.

3d mile: One shoal over slate ledges 500 feet long; fall 2½ feet.

4th mile: One shoal 600 feet long; fall, 2 feet 7 inches; and one 400 feet long, fall 1 foot 11 inches; and one sharp-edged ledge, no fall, 100 feet below last shoal.

5th mile: Good navigation.

6th mile: Foster's Falls; about 18 feet fall over slate and limestone ledges, in 2,300 feet, with a short pool and a succession of ledges.

2911 7th mile: Small pools, falling 8 feet in 32 feet.

8th mile: One or two small ledges to be removed; fall, 4 feet.

9th mile: Commerce with a fall of 3 feet in 400 over slate ledges.

10th mile: One rapid 600 feet long; fall, 7 feet.

11th mile: Good water.

12th mile: One small ledge 50 feet wide.

13th mile: Good water.

14th and 15th miles: Consist of shoal rapids for 9,000 feet, falling over sixteen ledges of shale and limestone, about 12 feet vertical.

16th mile: Good water.

17th mile: A succession of nine ledges, 2,000 feet over all; fall, 5 feet.

18th mile: One small ledge, fall, 5/10 foot.

19th mile: Fall of 1½ feet over ledges of shale for 300 feet.

20th mile: One ledge 200 feet wide, and one 20 feet wide; fall, 3 feet over both.

21st mile: Four ledges, each 50 feet wide; 6 feet fall over all.

22d mile: Five ledges; fall over all, 8 feet.

23d mile: Wide and shoal; river falls over six ledges; will require some work the whole distance; fall, 9 feet.

24th mile: River narrowing, but still falling over ledges of limestone and shale; about six ledges crossed; 7½ feet fall.

25th mile: Allison's Falls occur at the beginning of this mile, where the river falls 3 feet in 300 feet over a ledge of red shale.

26th mile: Good water, except some slight clearing away of bowlders; fall, 1 foot.

27th mile: River wide and filled with islands, among which the river falls 13 feet over four ledges; will require excavation for 2,500 feet.

28th mile: Good water; fall, 3 feet.

29th mile: River falls 8 feet over a succession of nine ledges of shale.

30th mile: One ledge 800 feet wide, one 300 feet; fall over all, 3 feet.

2912 31st mile: Wysor's Falls, where river falls 7 feet over two sets of ledges, both about 800 feet wide.

32d mile: Four ledges, each about 100 feet wide; fall, 10 feet.

33d mile: Commences with fall of 5 feet over five ledges, about 50 feet wide each.

34th mile: Good water; fall, .2 foot.

35th mile: Good water; fall, 2 feet.

36th mile: One ledge, 250 feet wide; fall, 2 feet.

37th mile: Two ledges, each about 200 feet wide; fall, 3½ feet.

38th mile: Commences with continuous ledges for 1,600 feet; fall, 3 feet.

39th mile: Good water.

40th mile: Good water; fall, 1 foot.

41st mile: Ledge of gray shale at lower end, falling 3 feet in 800 feet.

42d mile: Continuation of same shoal rapids for 1,500 feet; fall, 4 feet.

43d mile: Rapid shoals over bowlders and gravel for 1,000 feet, and then one narrow ledge with 4/10 foot fall.

44th mile: Two riffles over bowlders and gravel, about 100 feet in both; fall, 2 feet.

45th mile: Seven ledges; fall, 7 feet in 1,000 feet.

46th mile: Good water; fall, .5 foot.

47th mile: Two ledges, about 500 feet over both; fall, 4 feet.

48th mile: Shoal of bowlders and gravel, 500 feet long; fall, 1 foot.

49th mile: Rapids and shoals (mostly over bowlders) 2,000 feet long; fall, 4 feet.

50th mile: Good water; fall, 3 feet.

51st mile: Rapid, over bowlders and gravel, 1,500 feet long; fall, 8½ feet.

52d mile: Three narrow submerged ledges, 30 feet in all; fall, 1 foot.

2913 53d mile: At lower end Barnitz Falls, over five ledges of limestone 450 feet; over all fall, 6 feet.

54th mile: Shoal and rapid over boulders and gravel 800 feet long; fall, 4 feet. In this mile a portion of the river is said to sink and pass underground across the "Horseshoe Bend," reappearing in the 59th mile in the form of powerful springs, discharging water of about same temperature as that of the river.

55th mile: Good water; a few bowlders to remove; fall, .5 foot.

56th mile: Two ledges very narrow; fall, .5 foot.

57th mile: Good water; fall, .5 foot.

58th mile: Good water; fall, .5 foot.

59th mile: Shoals over bowlders, &c., 800 feet long; fall, 2 feet.

60th mile: Good water; fall, .5 foot.

61st mile: Good water; fall, .4 foot.

62d mile: Good water; fall, .4 foot.

63d mile: Good water; fall, .4 foot.

64th mile: At lower end commences Sifford's Shoals, with fall of 2 feet over slate ledges 500 feet wide.

65th mile: Continuation of Sifford's Shoals; river very wide and shallow; fall, 10 feet, over slate ledges about 200 feet apart, with 3 feet water between them.

66th mile: The same; fall, 9 feet.

67th mile: Shoals continue for 1,600 feet; then a short pool and Walker's Mount Falls, where the river falls 5 feet in 500 feet, over two ledges of shale and metamorphic limestone.

68th mile: Continuous ledges for 4,000 feet; fall, 8 feet. In this mile a subterranean stream discharges into the river from under left bank. The sound of a waterfall could be heard from under the rocks over which the line of survey passed.

69th mile: Good water; fall, 3 feet.

70th mile: Four ledges, extending over 1,000 feet, with a fall of 6 feet.

2914 71st mile: Good water; river very narrow and deep.

72d mile: One shoal over bowlders and gravel, 1,000 feet long; fall, 2 feet.

73d mile: One shoal, 1,500 feet long, over bowlders and gravel.

74th mile: Snidow's Falls, 2,000 feet in length, over bowlders and gravel; fall, 5 feet.

75th mile: One ledge of limestone, 300 feet long; fall, 3 feet.

76th mile: Four submerged reefs, about 50 feet in all; fall, .75 foot.

77th mile: One riffle over bowlders and gravel, 1,000 feet long.

78th mile: Rapids, 500 feet long, over bowlders and gravel; fall, 2 feet.

79th mile: Rapid over two ledges, 500 feet long; fall, 7 feet; swift water whole mile. In this mile a subterranean stream discharges into the river from under the right bank.

80th mile: Five ledges, 50 feet over all; swift water whole mile; fall, 7 feet.

81st mile: One rapid, 300 feet long, over bowlders and gravel; fall, 3 feet.

82d mile: One rapid over large rocks, apparently loose, bowlders and gravel, 500 feet long; fall, 3 feet.

83d mile: Rapid over four or five ledges, 200 feet over all, and lower down another 1,000 feet long, over rocks and pebbles; fall, 5 feet.

84th mile: Swift water; fall, 7 feet.

85th mile: Good water.

86th mile: At French's mill-dam is fall of 5 feet, over four limestone ledges, extending 1,200 feet.

87th mile: One small ledge; fall, 8 feet.

88th mile: One ledge, 100 feet wide, but can be avoided by going behind island and removal of 300 to 400 feet of gravel bar; fall, 3⅓ feet.

89th mile: Shoal over bowlders and gravel, 500 feet long; fall, — feet.

2915 90th mile: Shoal over loose rocks, 100 feet long; fall 3 feet.

91st mile: Good water.

92d mile. Peter's Mountain Falls, where river falls 4½ feet in 1,300 feet, over a succession of limestone ledges, terminating in an abrupt fall of 5 feet.

93d mile: Two ledges, ten feet wide each; fall, 3 feet.

94th mile: One shoal over bowlders and gravel, 500 feet long; fall, 3 feet.

95th mile: One shoal of bowlders and gravel, 1,500 feet long, containing three ledges of rock; fall, 5 feet.

96th mile: Good water; fall, 1 foot.

97th mile: Good water; fall, 4 feet.

98th mile: One long shoal of bowlders and gravel for 1,500 feet, traversed by one ledge of rock with 2½ feet fall over it; whole fall, 6½ feet.

99th mile: Good water; fall, 1 foot.

100th mile: Neilley's Falls and rapids; whole fall, 11 feet, 6 of it nearly vertical. A sluice 500 feet long, along left bank, will pass them, with 50 feet of rock excavation and 450 feet of bowlders and gravel.

101st mile: Commences with shoal, 600 feet long, over bowlders and gravel; fall, — feet.

102d mile: One riffle over bowlders, 100 feet long; fall, 2 feet.

103d mile: One riffle, 500 feet long, over bowlders and gravel; fall, 3.8 feet.

104th mile: Commences with shallow riffle, 600 feet long, over bowlders and gravel, and following this occurs Wiley's Falls, where the river falls 4 feet in 10 feet, over a limestone ledge about 50 feet wide.

105th mile: Riffle and shoal, 1,600 feet long, over bowlders and gravel, with four ledges of rock, which can be turned, however, by passing along right bank, through loose rock and gravel; fall, 5 feet.

2916 106th mile: One narrow ledge; fall, 2½ feet.

107th mile: A few loose rocks only; fall 3¾ feet.

108th mile: Riffles over pebbles for 200 feet; fall, 4¾ feet.

109th mile: Swift water and riffles over bowlders for three-fourths of a mile, terminating with a fall of 3 feet over a limestone ledge 200 feet wide; several large detached rocks below falls.

110th mile: Two falls over limestone ledges, each 2 feet in 250 feet; fall, 4¾ feet.

111th mile: Three ledges, 500 feet over all; fall, 2.4 feet.

112th mile: McDaniel's falls, ledge 300 feet long; fall, 4 feet.

113th mile: Good water; fall, .4 foot.

114th mile: Rapids and shoals over continuous ledges for 1,000 feet; about 300 feet of rock excavation; fall, 3 feet.

115th mile: Good water; fall, 1.4 feet.

116th mile: Good water; fall, 1 foot.

117th mile: Two small ledges, 35 feet in both, and 150 feet of shoals over pebbles and bowlders; fall, 2.3 feet.

118th mile: One rapid and shoal 1,000 feet long, over continuous ledges; fall, 8½ feet.

119th mile: Bull Falls, ledge 3 feet high; blasting for 100 feet, and rapids 300 feet long below, over pebble and bowlders.

120th mile: Four ledges 250 feet long over all, ending fall of 3 feet over a ledge 20 feet thick.

121st mile: Three ledges, and rapids for 500 feet over loose rock and gravel; fall, 1 foot.

122d mile: Shoal over gravel, 1,000 feet long; fall, 3 feet.

123d mile: Good water; fall, .22 foot.

124th mile: Shoals and rapids, crossed by seven or eight ledges, extending 1,000 feet; fall, 6¾ feet.

125th mile: About 3,000 feet in length of shallow rapids over bowlders and gravel.

126th mile: One rapid 500 feet long, crossed by two ledges of rock; fall, 2.25 feet.

2917 127th mile: Good water.

128th mile: Ends with three-fourths of a mile of rapids; shoals over ledges of sandstone. To connect with Greenbrier would be necessary to canalize behind islands; fall, 7 feet.

The results of the survey are not yet sufficiently arranged and developed to enable me to present an exhaustive review of the subject of the improvement of this river, but it may be said generally that the object of the improvement, as expressed by the promoters of the scheme, is to connect the iron, lead, and zinc deposits of Wythe County and the copper of Carroll with the coal of the Kanawha fields.

The region traversed by New River, through the counties of Wythe, Pulaski, Montgomery, Giles, Mercer, and Monroe, is one of the most fertile in Virginia, notwithstanding its general mountainous character.

Carroll and Wythe Counties abound in rich deposits of copper, iron, lead, zinc, and manganese, which are yet hardly developed, owing to the want of economic means of transport, though there are now in operation, within a length of 20 miles along the river, nine iron furnaces, and the Wythe Union Lead Mines, which have been worked for more than a century, and still yield abundantly of lead and zinc ores of great purity.

These counties, as well as those before named, farther down the river, possess fertile soils and abundance of good timber. The whole region is remarkably well adapted to sheep-raising; and it can hardly be doubted that the immense water-powers existing all along this river and its tributaries would be utilized for woolen and other manufacturing operations, if an outlet were offered to a market.

The improvement, if effected, would, in about 40 miles below the lead mines, intersect the Virginia and Tennessee Railroad and the Chesapeake and Ohio at the mouth of the Greenbrier, thus opening to both eastern and western markets a large area of productive country, now practically shut up.

The present wants of this region would be met by any system of improvement which would afford 3 feet depth of water
2918 during the lower stages of the river. With only so much reduction of grade at the falls and rapids as would permit a small stern-wheel steamer to ascend with two barges in tow, even if at a few points, the ascent required to be made by hauling up by ropes attached to fixed points above and to the drum of the steamboat engine.

This extent of improvement can be accomplished, except at Foster's Falls, by clearing out sluiceways through the shoals and rapids, at nearly their natural grades, and by opening through the vertical falls and ledges sluices with a slope not exceeding 1 to 10; and all work done upon this place would be available toward the completion of a more thorough and complete system.

At Foster's Falls a lateral canal, at least over the first fall of 18 feet, would seem to be essential.

An approximate estimate of cost for this work would be—

60,000 yards rock excavation, at $2.50	150,000
350,000 yards removal of loose rock and bowlders, at $1	350,000
50,000 yards rock in wing-dams, at $1	50,000
Canal around Foster's with two locks, 9-foot lift	200,000
Total	750,000

The present system of transportation on this portion of the river is by keelboats which carry from two to three tons, and are rowed or floated down the river and poled up. An expenditure of $100,000 would greatly ameliorate the condition of the river for this trade, and enable the trips to be made with so much more certainty as to induce a considerable increase of trade.

In conclusion I would say that, owing to occupation in other duties during the working season just closed, I have been unable to give this subject the attention it requires, and that, on a subsequent and more complete review of the results of the survey, some of the views and figures here presented may be considerably modified.

With this I would also submit the report of Mr. C. R. Boyd, civil engineer of Wytheville, Virginia, on the extent and 2919 character of the resources of the country traversed by the New River, and dependent, to a greater or less extent, for their full development on the improvement of its navigation.

Mr. Boyd has given much of his time to a study of the mineralogy of this region, and is peculiarly well fitted to write upon the subject intrusted to him.

I am also indebted to Mr. Boyd for his valuable professional assistance in the execution of the survey; and my acknowledgments are due Mr. F. Dielman, topographer, and Mr. Charles Humphreys, surveyor, for the very efficient performance of their respective duties.

Respectfully submitted.

N. H. Hutton, *Assistant.*

Colonel W. P. Craighill,
Corps of Engineers, United States Army.

2919A Wytheville, Virginia, *December 17, 1872.*

Sir: In compliance with instructions to collect and forward data bearing upon the value of the improvement of New River to the adjacent country, I have the honor to submit the following report, together with a map illustrative of the country treated of. At the same time I would ask indulgence for the omission of much important information, which the time and means at command would not permit me to procure.

Assuming that the mineral interests of the country tributary to New River are, or will be, of paramount importance, I have devoted the body of this report to that subject.

That section of country contiguous to and likely to supply tonnage at once to a New River improvement, beginning at its southwestern limit, is the following: A part of the counties of Ashe, Alleghany, and Surry, in North Carolina; parts of the counties of Carroll, Grayson, Wythe, Pulaski, Montgomery, Bland, Tazewell, and Giles, in Virginia; and the counties of Mercer, Monroe, and Summers, in West Virginia; comprising an area filled with apparently inexhaustible deposits of iron-ore of high grade, coal, lead, zinc, copper, baryta, salt, alumina, sandstone, (millstone and grindstone grit,) limestone, (both ordinary and magnesian,) and sometimes strong indications of beds of gypsum, some of which leads of ore are exhibited nearly in their actual position upon the accompanying map.

About the counties of Ashe, Surrey, and Alleghany, in North Carolina, I know but little, except that greater facilities than they have yet enjoyed for transportation will greatly stimulate the raising of copper ores from mines now idle (so distant are the smelting establishments,) as well as the production of cereals, dried fruits, cranberries, tobacco, &c., for which they are noted.

The counties of Grayson and Carroll in Virginia, lying between diverging ridges of the Blue Ridge and Alleghany Mountains, and essentially mountainous in physical structure, are watered by New River and tributaries, having a good native soil, and often showing their highest ridges in cultivation to their summits.

Their large deposits of copper and iron have long since induced enterprising men, of their own and neighboring counties, to devote capital and time to the raising of ores to find themselves prohibited from realizing a safe return by the imperfect means of transportation.

The copper and accompanying arsenate of iron, showing conspicuously three miles southwest from Hillville, the county site of Carroll County, have been traced southwardly to Duck Town, in Monroe County, Tennessee.

The kinds of copper ore given by Dr. Dickeson, geologist, of Philadelphia, are the red oxide, 63.04 per cent.; black oxide, 54.02 per cent.; smut, 25.12 per cent., from good ores in the Dalton mines; giving an average from good and bad of 32 per cent. of metallic copper.

The vein seems to have a trend S. 28° E., (no doubt variable on the lead;) dip tending to vertical, with a width seldom diminishing below 8 feet. The water-power of these, like that of all the other counties treated of in this report, would be decided, upon close inspection in the driest weather they experience, as very good, inasmuch as but few of the whole number of streams become dry in any season. Their agriculture is improving, and would, under more favorable circumstances, send large supplies of grain to market.

The trade in horses, cattle, hogs, sheep, wool, leather, tobacco, cranberries, fine apples, dried fruits, &c., is now a matter of much local interest.

The counties of Wythe, Pulaski, and Montgomery, lying pretty much between parallel ridges of the Alleghanies, are chiefly drained by New River and its tributaries. Their physical structure is that of a plane of broken surface, declining toward the New River basin, presenting in many localities broad areas of gently-rolling lands, covered with either a luxuriant sod of grass, and supporting large herds of beautiful cattle, or with cereal crops, which the fine limestone substratum enables them to produce abundantly.

From the head of Cripple Creek, in Wythe County, extending north by east along the creek, crossing New River, and extending through the southern portion of Pulaski and Montgomery Coun-

ties, is a great lead of iron ore, as represented on the map,
2419B varying in breadth, as shown by its furnaces and forges, from half a mile to two miles, sending off now and then arms but little less extensive than the main lead, giving the capital and labor invested along it remunerative returns, although the imperfect means of transportation for metal and supplies would appear to be prohibitory. This lead, as developed at Radford iron-works on Mack's Creek, Pulaski County, trending N. 86° E. for seven miles, dip 30° southwestwardly, shows two immense veins of stratified iron ore, between a roof and floor of slate, whose least thicknesses are respectively six and nine feet. No doubt the loose ores worked to the southwest, in Wythe County, are decrepitated from these veins lying hidden under the débris of the mountains southwestwardly from the furnaces and forges of Messrs. Graham, McGavock, Howard, and Saunders, Painter, Pearce, Chatwell, Huddle, Gallup, Crockett & Sanders, and Sayers & Oglesy. This lead has given from its lease valuable ores an assay of 50 per cent. of metallic iron. It may be as well to call attention to the fact that branches of this lead are to be found lapping around both sides of Lick Mountain, Draper's, and the Roaring Falls Mountains in Wythe County, as well as that part of the Draper's Mountain in Pulaski, where an assay of the iron ore has given 87 per cent. of metal. The same, as to branching leads, may be said of many mountain spurs and ridges on the south side of Montgomery County.

The furnaces and forges above enumerated are now shipping 12,000 tons of metal annually, with a supply of charcoal timber so greatly diminished as to cause many of the proprietors to look abroad rather anxiously for supplies of stone-coal or coke.

The lead and zinc ores of these counties accompany each other throughout a great part of the distance traversed by either, having a course nearly parallel with the iron.

The Union lead mines, in Wythe County, have been worked for more than a century, giving a great part of the metal that was used by the colonists in the Revolutionary war, and supplying nine-tenths of the lead consumed by the confederates in the late war. The ores are chiefly carbonates and sulphurets, overlaid by heavy masses of zinz ore, which are mined and shipped north in the crude state. In fact, it seems to be one of the distinctive features of the lead at this point that zinc ore is always superposed upon it. The recent discovery by the company of a vein 50 feet in thickness, renders it an inexhaustible mine. To the southwest tracings of this lead have been found as far as Tennessee. It is distinctly marked twelve miles north by east, and farther than that is either displaced by the zinc ore or lies at a greater depth.

It is highly probable that the lead which shows in remarkably pure masses at Childress's Store, in Montgomery County, bends abruptly to the left along a spur, and outcrops again at Eskridge's at Repper's Ferry, where at one time it was mined and reduced to metal.

The zinc ore to the southwest of and near the mouth of Reed Island Creek, appears near the surface in masses, giving upon assay a percentage which has induced purchases by experienced miners, and it would be extensively worked were a more certain means of transportation provided.

The coal lying toward the northern boundaries of the counties of Montgomery, Pulaski, and Wythe, in the southern slope of a mountain which is most generally known as Cloyd's or Little Walker's Mountain, crossing the river near Lifford's, is variable in the thickness of its measures, showing veins occasionally seven and a half feet in thickness, changing from a nearly pure anthracite to a coal containing nearly 20 percent of bitumen. It has been estimated by experts that ten miles' length on two veins in Montgomery County, above water-level, will yield 850,000 tons; but there are certainly five veins in this lead developed in Wythe County, varying in thickness from an 8-inch seam to a 7½-foot vein, with a strong probability of the existence of three more, which, if they should continue through that portion contiguous to New River, would suggest the idea of a very great quantity both above and below water-level, as it has been found to outcrop at elevations varying from 1 to 600 feet above water-level. Accompanying these measures, both above and below, are veins of valuable iron ore, thinning out and thickening along their extent, in some places well-defined specimens of the hydrated peroxide of iron having been taken from a vein overlying the coal at a short distance, while the veins beneath are more or less hematitic in character, sometimes fossilliferous, as at Tyler's, in Pulaski. The coal has an average trend about north 70 degrees east, average dip southwestwardly 30 degrees, until it reaches that part of Montgomery broken by anticlinal ridges. The most conspicuous openings upon these measures are located near Blacksburgh, in Montgomery County, Tyler's and others, in Pulaski County, and at Stony Fork, in Wythe County, at neither point a greater distance than twenty-five miles from the river. They are now engaging the attention of a continually extending trade. While prosecuting the survey of New River through the gaps made in the mountains by the passage of the river, I saw great masses of white siliceous conglomerate, perhaps 500 feet beneath the coal-veins, and, within that space, good grindstone grit, which has been mined, particularly in Wythe County, for a great many years, not far from which, in the cove of Wythe County, are extensive beds of marble.

Bartya in these counties seems to accompany the leads
2919-c of lead and zinc, pure in some veins, in others discolored by
manganese and iron ore, requiring the use of sulphuric
acid to force it from its impurities.

Bodies of white-oak timber and pine of various kinds are likely to engage the attention of the shipping interests on the sea-board when transportation shall be more convenient.

The county of Giles, lying on both sides of New River, between great parallel ranges of the Alleghanies, is essentially limestone in geological structure, except in the greater mountains, which are made up of quartzose and siliceous rocks, slates, shales, &c. The soil is superior, being based in the main upon limestone, and is noted for excellent natural grasses, fine herds of cattle, good crops of the cereals, tobacco, &c. Sheep-raising in this, as well as in most southwestern counties, forms a very important item in domestic economy, yielding large quantities of wool for shipment. The iron ore of Giles County is extensive and of excellent quality. Experts have regarded the body of ore upon the Little Flat Top Mountain, lying westwardly from the river, in the Kimberling country, as the largest of good quality known to exist in Virginia. These ores are a fine, dark hematite, of high percentage of metal, located about as represented on the map. The ore showing on slopes of Saltpond Mountain, near Newport, is in large quantity, and turns out, at the works of Mr. Williams, a tough and easily-worked metal. The coal situated toward the western boundary of the county, near the large deposists of iron, needs further investigation to prove its quantity and quality.

The same measures, extending the length of Bland County, have been opened in some places, showing thick veins near Sharon Alum Springs, and a fair quality of coal, which will, no doubt, improve as the mining proceeds. Strong hopes are entertained on Walker's Creek, and in Burk's Garden, that the coal showing in those localities will prove to be in large quantity. This county includes a part of the Little Flat Top Mountain deposit of iron. With that and the iron ore on the northern boundary, it presents masses of metalliferous deposits of great value. The fine bodies of white-oak, pine, walnut, cherry, beech, maple, &c., abounding in this county, will, no doubt, be sought after by ship builders and furniture makers, while nearly equal facilities exist with the other counties for the raising of fine cattle, sheep, and hogs.

Toward the northern boundary of the county of Giles, near the narrows, (Peter's Mountain Falls,) exist ores of either plumbago or dark oxides of some of the finer metals, which need a thorough assay to name them.

Mercer County, West Virginia, between the East River Mountain and the Great Flat Top Mountain, as to its available lands between East River and Bluestone River, is a plateau elevated 700 or 800 feet above the level of the river, drained in great part by the East River, Bluestone, Lick, and Island Creeks; and as to minerals, is chiefly remarkable for extensive measures of bituminous coal on the southeasterly slope of the Great Flat Top Mountains, extending through the whole of the northwestern side of the county, requiring further development to show number and width of the veins. They, however, outcrop for a distance, directly across their trend, of nearly ten miles; the greatest measure yet developed being an 11-foot vein.

The northern slope of East River Mountain shows considerable deposits of iron ore, ledges of variegated marble, very pure baryta, and fine millstone grit extending along Peter's Mountain into Monroe County. Iron ore does not exist in such masses as in Giles County, but upon Bluestone, above the mouth of Brushy Creek, presents fine bodies of ore, which have yielded, upon assay, from 48 to 80 percent of metal, chiefly lying upon the spurs of the Black Oak Mountains, as well as in ridges and spurs of the Flat Top, upon the opposite side of the Bluestone River. This county is particularly noted, also, for containing large forests of white-oak timber, while its soil is thinner, being generally a sand rock beneath, from which, in places, a fine grindstone grit has been taken. It is sometimes crossed by ledges of limestone, probably magnesia, from which good lime has been made.

Monroe is almost entirely limestone in its substratum, has a deeper soil, but, as to minerals, too little is known to venture upon any positive location of the several bodies of fine ore which she is known to possess, except the lead of iron upon Little Mountain, lying next Peter's Mountain, on south boundary, from which metal has been manufactured of good quality.

This county, unlike Mercer County, presents an alternation of ~~ridge and~~ valley, and is one of the best timbered counties in the State.

That part of the county of Summers within reach of a New River improvement is chiefly noted for a fine body of white-pine timber on Bluestone River, beginning near its mouth and extending into Mercer; for evidences of coal measures near Crump's, together with a part of the Great Flat Top measures, and for the salt-wells upon the left bank of New River.

To sum up, a sufficient transportation will throw open to the world great metalliferous deposits, with the extent of which I was scarcely even in part acquainted, until that cursory examination of which this is the report.

The kinds of valuable timber in all these counties are white, red, Spanish, black, post, and pine oaks, black and white walnut, 2919–D poplar, beech, birch, white, yellow, and black pines, cherry, hickory, sugar-maples, lynn, buckeye, chestnut, and cedar, all of which exist in extensive bodies in various localities within the scope of this report.

A line drawn from Princeton, in Mercer County, east by south, toward the southern boundary of Pulaski, will pass over but little country whose rocks do not dip almost regularly at an average angle of 30 degrees southwestwardly.

The points which would suggest an idea of important geological divisions are, first, in the line of the East River and Peter's Mountains; again, near the coal measures in the gaps of mountains crossing the river just below Lifford's; and, lastly that I have noticed, in the contortions along New River, near to and below Foster's Falls, where appear those red shales and slates, forming for many miles the bed of the river, (easily worked,) classed by some persons as the new red sandstone, while Foster's Falls (just opposite the Roaring Falls Mountain) are composed of quartzose silicates, of earlier formations.

Respectfully submitted.

C. R. Boyd,
Assistant Engineer.

Colonel William P. Craighill,
Corps of Engineers, U. S. A., Baltimore, Maryland.

United States Engineer Office,
Baltimore, Maryland, January 9, 1873.

General: I have the honor to transmit herewith, as supplementary to my report on the survey of New River, Virginia, forwarded on the 20th December, 1872, the following drawings, viz:

Eleven sheets of map of New River, scale 1 inch to 800 feet.

One tracing of map of New River, scale 1 inch to 6,600 feet.

One tracing of profile of New River.

One tracing, showing the location of coal and mineral deposits of region of country drained by New River.

The first-named maps exhibit the meanderings of the stream, its width, and generally its depth, as well as the positions of ledges, shoals, and falls, and the topography of the valley;

The second, which is from a survey made in 1820, by Mr. H. P. Taylor, shows the general outlines of the river on a smaller and more convenient scale;

The third indicates the slope of the water-surface from the lead mines to the Greenbrier; and

2920 The last named shows, in black, the lines of coal deposits, and in brown the location of deposits of iron, zinc, and lead.

On the large-scale maps the proposed dams and locks are shown in red. All shoals, &c., not otherwise marked, are indicated to have sluiceways cut through them.

The general character and extent of the obstructions to navigation in this river were so set forth in the previous report as to render a repetition unnecessary, but in order to clearness now, it may be well to refer to some of the points in that report.

It was there stated that to give a keelboat navigation of 2 feet depth, which would require tracking or towing paths, where the ascent was too steep to permit the use of poles, would cost $100,000. This estimate is not changed by subsequent and more careful study of the maps and profiles.

It was also said that the expenditure of $750,000 would afford a 3-feet navigation for small steamers, provided that at several places they were drawn up the steeper ascent by ropes attached to fixed point above, and that a lateral canal were constructed at Foster's Falls.

More mature reflection, with a study of the results of the survey, induces the conclusion that a steamboat navigation, impeded by the necessity of hauling up the boats over the steeper places, would be unprofitable and unsatisfactory, and that for steam navigation to be efficient such drawbacks must be done away with.

More careful estimates also indicate that by using a less expensive and a nearly equally serviceable method of construction of locks and dams than was contemplated in the former report, the canal around Foster's Falls can be constructed for about $60,000.

It was expected that the river might, with advantage to its discussion and treatment, be divided into several separate sections relating to their respective facilities for improvement and their connections with transverse means of transportation by rail or otherwise. This expectation has not been realized, except
2921 to the extent that that portion of the river lying between the lead mines and the crossing of the Virginia and Tennessee Railroad (a distance of forty-four miles) would seem to be that which deserves the more immediate attention, as being the only outlet for the large mineral productions of the adjacent counties, as well as of those lying along the river beyond and in North Carolina. The lower counties are principally agricultural; the extent and kind of improvement required for the betterment of the river is about the same throughout.

The two plans which, after mature delay, are recommended for consideration are as follows:

A 2-feet keelboat navigation, as explained in the former report, costing $100,000; or a 3-feet steamboat navigation, as set forth below, which would cost $1,000,000.

To expect a navigation for steamboats of light draught, it is assumed that they can for short distances ascend a grade of 1 in 400, with a current of five miles per hour. It is therefore proposed to excavate a sluiceway 90 feet wide and 3 feet deep through all shoals having a grade not exceeding 1 in 400. Where the grade exceeds this, low regulating dams are proposed, with sluices with a fall not exceeding 1 foot at each. In several cases, as stated below, and indicated on the large map, dams should be introduced containing locks; and in two other places, lateral canals.

The dams and locks may be of crib-work filled with stone, for which an abundance of material is found all along the river. It was not possible with the means at command to determine the exact position and height of dams required, or the precise amount of excavation, but the estimates are believed to be sufficient both as to quantities and prices.

The dams are estimated at an average height of 6 feet, with a width at base of 12 feet. The locks are estimated at 25 feet wide and 90 feet in length, with a depth of 4 feet on the miter-sills, in order to allow for any probable future extension of the depth required by the boats navigating the river.

2922 The estimate for a 3-feet steamboat navigation will be, as explained above:

100,000 yards rock excavation, at $1.50	$150,000
500,000 yards gravel and bowlder excavation, at 50 cents	250,000
60,000 linear feet of dams, at $5 per foot	300,000
Two locks, 10-feet lift, at Foster's	40,000
One lock, 9-feet lift, at Gadby's Ferry	20,000
One lock, 7-feet lift at English's Ferry	18,000
One lock, 6-feet lift, at Barnett's Falls	17,000
Four locks, 7-feet lift, at Lifford's Falls	72,000
One lock, 10-feet lift, at Peter's Falls	20,000
One lock, 5-feet lift, at Neilly's Falls	15,000
One lock, 5-feet lift, at Weilley's Falls	15,000
	217,000
40,000 yards canal prism at Foster's Falls, at 50 cents	20,000
160,000 yards canal prism at Lifford's Falls, at 50 cents	80,000
Total	1,017,000

The portion of river included between the lead mines and the Virginia and Tennessee Railroad will cost to improve, according to this plan, about $350,000, and it would appear, as stated above, that it is the part at present most needing improvement for the development of a valuable interest already existing.

The pools are now capable of navigation by vessels drawing 5½ feet. To give a lock and dam navigation of 5½ feet from the lead mines to the mouth of the Greenbrier would cost about $2,500,000, overcoming a fall of 550 feet in one hundred and twenty-eight miles.

The statement was made in the former report that a comparatively small sum could be expended on this stream with great and immediate benefit to its navigation, which would be useful in the more extended improvement under any plan likely to be adopted in the future. That opinion is still entertained. 2923

Very respectfully, your obedient servant,

WM. P. CRAIGHILL,
Major of Engineers.

Brigadier-General A. A. HUMPHREYS,
Chief of Engineers, Washington, D. C.

2924 *Government exhibit 32*

(pp. 3–32; 62–65; 113–114)

Report of Moore and Briggs. Fourth and Fifth Annual Reports of the Board of Public Works to the General Assembly of Virginia (1819). Report of the Principal Engineer of the Board of Public Works.

2924–A

REPORT

To the Board of Public Works for the State of Virginia:

Having, in the early part of the year, contracted with a manufacturer in Baltimore, for several important instruments, they arrived in Richmond on the 20th of the 3d Mo. last. Asa Moore was appointed as an Assistant on the 24th, and on the 26th, we commenced laying out the Manchester canal, agreeably to the instructions of the Board, of the 12th of the same month. Isaac Briggs having been applied to, by direction of the ex-officio members, to supply the place of additional Engineer, arrived on the 27th, and immediately joined us in the work.

After completing the survey, levelling, and taking notes for estimating the cost of this canal, whilst our boat was fitting up, and other preparations making for our western tour, we were employed in the same kind of operations on the northern side of the James River, between the lower arch and Sabbat Island.

On the 27th of the 4th Month, having completed our preparations, we commenced our journey westward; and, (for reasons which will hereafter appear) as we went up the river, continued our survey for an independent canal, from opposite the lower point of Sabbat Island, to the upper end of Pleasants' Island. We arrived at Lynchburg on the 10th of the 5th Month.

Previous to our leaving Richmond, we were so fortunate as unexpectedly to meet with two more excellent levelling instruments for sale, both of which we secured; one on our own account, and the other on account of the Board of Works, by direction of the ex-officio members. At Lynchburg, by appointment, we were met by Thomas Mifflin Ladd, another assistant, who brought with him a small theodolite, a very useful and convenient instrument for the necessary field operations in laying out roads. This made our stock of instruments very ample and complete.

At Lynchburg, agreeably to arrangements previously made, another boat was purchased, and delivered to Asa Moore, in order
to be fitted up for the purpose of attending him on a sur-
2924–B vey for an independent Canal from that place to the head
of Pleasants' Island, and afterwards on other sections higher up the river. This part of the work was confided to him, in consequence of his having had more experience in using the levelling instrument than either of our other assistants. A set of hands was therefore organised as his assistants, and the necessary instructions given him for the execution of the work; which it was our intention to examine on our return from the westward, and to take notes on the ground for the purpose of enabling us to form estimates of the different items of expense incident to the formation of such a canal.

It would seem that some time might have been saved, by commencing the survey for this canal at Dunlap's Creek, (the highest point,) and continuing the same regularly, to its lower termination, instead of first laying out a lower section, and then passing again up the river to a higher; but there were circumstances which rendered the plan adopted the most eligible. One was the difficulty of conducting levelling operations through fields corn, when grown to the height of six feet and upwards. This made it very desirable to have that part of the business which lies in the great corn country between Lynchburg and Richmond, executed as early in the season as possible. Another was, that this part of the line lay entirely on one side of the river, and presented less difficulty than those parts higher up the river, where a greater exercise of judgment would be necessary to determine on the places of crossing, and the choice of grounds for the canal; supposing it possible that either my colleague or myself might be able to return from the mountains in time to conduct at least a part of the survey over these more difficult grounds. A third was, that, as we were apprehensive that the whole of the survey might not be completed in the season, we deemed it expedient to make sure of the lower sections.

After remaining at Lynchburg a few days, for the purpose of making the before-mentioned arrangements, procuring supplies, &c., we continued to ascend the river to the mouth of Craig's creek; Andrew Alexander having joined us by appointment

on our way to this point. In conformity to our instructions on the 24th of the 5th Mo. we commenced the levelling and surveying of that stream, continuing the same up to the mouth of John's Creek, 49 miles, to which place we ascended with our boat. Whilst Isaac Briggs was conducting the early part of this survey, I passed up the valley in which this stream is situated, by way of the road; and from the mouth of John's Creek, across the Alleghany ridge, to the waters of Sinking Creek, thence down the same to New River, with a view to obtain a general knowledge of the country, and to determine
2924–C on the route for the survey, after leaving Craig's Creek.

On this tour, I was very agreeably accompanied by General J. Breckenridge, Major Andrew Hamilton, Major ——— Burwell and Carey Breckenridge.

On my return, I joined my colleague and company, and we continued together as far as the boat ascended the creek, where we found a separation would very much conduce to the despatch of business. And accordingly, Isaac Briggs continued the levelling and survey across the mountain, and down to the mouth of Sinking Creek, on New River; whilst I returned with the boat to James River, and thence up to the same and Jackson's River to the mouth of Dunlap's Creek, where waggons were (with some difficulty) procured to convey the boat, our baggage and stores, across the Alleghany mountain to Greenbrier River, at the mouth of Howard's Creek. Isaac Briggs and company having completed their survey, crossed the country, to the mouth of Dunlap's Creek, from whence a similar survey and levelling was made, to the mouth of Howard's Creek; where the boat had previously arrived, been overhauled, refitted, and launched into Greenbrier River, and waiting their arrival.

On the 21st of the 6th Mo., Isaac Briggs and company commenced the survey and levelling of Greenbrier River. At the same time, Hugh P. Taylor, a young man of our party, possessing talents and industry, and who had previously proved himself qualified for the task, was detached as surveyor of roads, and lines of experiment, incidental to laying out a new road. His first business was to survey the present travelling road or post road, from Greenbrier to the Falls of Kanawha, and the route known by the name of the Gauley route, to the same place, preparatory to their being delineated on a map. Whilst this was going on, I was employed about a week, in company with Josias Shankling, surveyor of Greenbrier county, in examining these two routes, and obtaining a general knowledge of the adjacent country, in order to lay out work for the surveyor in my absence. This being accomplished, and his instructions made out, I returned, and joined the party on the river, on the 29th, near the end of the 37th mile.

The navigation of the Greenbrier river, from the mouth of Howard's Creek to New River, and of the latter, from the mouth of Greenbrier up to Sinking Creek, thence down to Bowyer's Ferry, thence to the Kanawha, and of the Kanawha to its junction with the Ohio, are subjects of interesting consideration; and the proper selection of the modes of improvement, best adapted to the impediments to be overcome, with estimates of the expense, constitute a very important part of our duty. We therefore
2924–D continued together from the 37th mile, on the Greenbrier
river, to the mouth of the Kanawha; a tedious, and, in places, extremely perilous journey.

As horsemen can travel from the mouth of the Kanawha to the Falls, in less than half the time that it would require for our boat to ascend the stream, in order to make the best use of time, and to give Isaac Briggs an opportunity of seeing some part of the grounds between the Falls and Greenbrier River, previous arrangements had been made for horses, to meet us at Point Pleasant. The boat returned, with our baggage and men, to the Falls, where it was met by a waggon from Greenbrier county, which had been before engaged to carry our baggage to Jackson's River. Isaac Briggs and myself arrived several days before the boat, and occupied the intermediate time in viewing grounds for the contemplated road. On our way up, we made sale of the boat, to be delivered at the Falls.

Hugh P. Taylor having executed the work laid out for him, met us, by appointment, near the Falls. From an inspection of his maps, and from the want of satisfactory information relative to a large extent of unsettled country, over which a direct line between distant points of the contemplated route would pass, it was deemed advisable to run a direct line between certain points, about 23 miles asunder, through this country, to serve as a guide line in exploring, in case it should appear probable that the route would be improved by making use of grounds near that direction. This was executed whilst the waggon was travelling across the mountains, and Isaac Briggs and myself engaged in viewing other grounds.

On our arrival at Jackson's river, Isaac Briggs commenced the survey for an independent canal, from the mouth of Dunlap's creek downwards; and Hugh P. Taylor returned to his home, in Rockbridge county, for a short time.

Asa Moore having executed his survey below Lynchburg, about the middle of the 7th Month, he had been directed by letter to move up to Wood's Island, about 30 miles above Pattonsburg, and to execute the same kind of survey between those points that he had made below; this part of the line presenting less difficulty than any other of equal length above Lynchburg. He had now nearly finished the survey of this section, and his boat was wanted to accommodate Isaac Briggs and his party. I therefore rode down, and found him near Pattonsburg, examined a part of his work on the way, and returned with him and his boat to Jackson's River, where he united with Isaac Briggs, in forwarding the survey of the canal.

Hugh P. Taylor returned and met me, by appointment, at
Callaghan's, 6 miles west of the mouth of Dunlap's Creek,
2924-E on the 9th of the 9th Mo.; and, on the 10th, commenced
the survey of the road, from the mouth of Ogley's creek, by the way of Sweet Springs, Union, Indian Creek, and Pack's Ferry, to the Falls of Kanawha. Whilst this was going on, I spent two days in viewing this route, as far as Indian Creek; then went across to Lewisburg, and explored the grounds, for the purpose of improvement, to the top of Meadow mountain, near the present road; thence near the direct line recently run, so as to be able to direct the survey for the location of the road, on our return.

The survey of the road, by way of Indian Creek, &c. was completed on the 21st; and, on the 22d, we commenced the final location of the new road, and finished on the 13th of the 10th Mo. Hugh P. Taylor then returned home, and I rode down and joined Isaac Briggs on the canal survey, 12 miles above Lynchburg. This survey was completed on the 26th. On the 28th, left Lynchburg, and proceeded to examine Asa Moore's survey to Pleasants' Island, taking notes for estimating the expense of making the canal. We arrived at Richmond on the 10th day of the 11th Mo. 1819.

Having given this rapid historical sketch of the whole of our operations during the late season, I will now proceed to describe the rivers, creeks and land surveys, distinctly, in the order in which these examinations and surveys were made, including estimates of the expense of improving the water courses and making the road, with observations on the individual and relative importance of each; beginning with

CRAIG'S CREEK

This stream, as will be seen by the map annexed to this report, is remarkably crooked in its course; the valley through which it flows, is considerably sinuous, and may be stated to be from one quarter to two miles in breadth. The stream frequently traversing the valley from side to side, gives a much greater length than a line passing through the middle or on either side of the valley. It measures, from its confluence with James river to the mouth of John's Creek, 49 miles. Its average width for this distance, may be about 55 yards; the whole fall 345 feet, or a small fraction over feet per mile. The greatest fall in any single mile is 13.33 feet, and but one mill less than three feet.

Very little has ever been done to improve the navigation of this creek. In the year 1818, a small sum was expended in removing a few of the most material obstructions. This sum, I have been told, did not exceed $400; yet even this has rendered it an useful navigation several months in the year.

2924-F I am of the opinion, that a moderate sum, (say) 5 to 6,000 dollars, judiciously expended, would give 18 inches of water, in all places below John's Creek, six months of the year, in usual seasons, and 12 to 15 inches two or three additional months.

We left John's Creek on the 3d of the 6th Month, the water was then said to be unusually low for the season; but if properly collected in sluices, would certainly have given more than 12 inches. The quantity is doubtless at all times amply sufficient for the purpose of supplying a canal. But, by reference to the notes of survey, it will be seen that the very frequent occurrence of high, precipitous, rocky banks, on both sides, precludes the idea of constructing a continued canal on either shore; and the great inconvenience and expense attending the numerous crossings of the creek, added to 345 feet of lockage, forbids the adoption of any plan for making one entirely through the flat ground in the valley, unless some very important benefit was to result from it.

The importance of the navigation of this stream depends very much on the description of improvement which may be adopted on James River. If a good sluice navigation is effectuated in the bed of this river, Craig's Creek will become the channel through which the surplus produce of the valley in which it lies, must find its way to market. Some inducement will also be given to bring some of the adjacent hill sides and smaller vallies into cultivation; so as greatly to increase the quantity of products now raised on its waters. And, if a good road should be made across the Alleghany ridge into the Sinking Creek valley, a part of the products of that district of country would also be invited to pass over to an eastern market.

But, if such a navigation was made down the ravine of the James River, as would reduce the expense of transportation to one-half, or less than half of the price by a sluice navigation, the difference being probably equal to the cost of transportation on a good road from New River, at the mouth of Sinking Creek, to the mouth of John's Creek, the inducements would be great, not only to the inhabitants of Sinking Creek valley, and its immediate vicinity, but also to many, further up New River, to transport their most valuable products to the head of the navigation on Craig's Creek, to be thence forwarded to market.

Craig's Creek, above its junction with John's Creek, is too small to admit of improving it for navigable purposes, containing not more than about one-third the water that passes below. And John's Creek, though about double the size, is 2934-G so excessively rapid, that there is as little prospect of improving it for those purposes, in any stage of the water.

The dividing ridge between the waters of Craig's Creek and those of Sinking Creek, is much more elevated than we had been led to suppose. The lowest spot in the ridge is 1,279 feet, above the water, at the mouth of John's Creek. The highest spring, tributary to Craig's Creek, 1,225 feet; and the highest water of Sinking Creek, crossed by the survey, 1,237 feet. This stream was then a small spring branch; its extreme source probably about the same elevation as the lowest part of the dividing ridge. The survey (as will appear by the notes) was conducted partly by the road, and partly in the ravine of the Rocky Run branch of Craig's Creek.

SINKING CREEK

The head spring of this creek has already been described. After being joined by several other small streams within a short distance, it passes through a fertile valley, about 34 miles, (by the survey, but something more by its meanders.) to New River, and falls, in this distance, nearly 966 feet. Twenty-six miles from its mouth, it was believed, when the survey was made, there was water sufficient for an independent canal; but, from that point downwards, a lockage of 630 feet would have to be provided for. It is in every part too small to use advantageously in the bed of the stream without dams. If dams were to be erected, there is reason to suppose so much of the water would be wasted through the porous matter of which the banks in many places are composed, that enough would not be left to supply the locks, which would be equal in number to those in an independent canal. About 7 or 8 miles from its mouth, the quantity of water begins to diminish, by wasting through the porous limestone rocks, which form the bed of the stream; and several miles from the mouth, it entirely disappears, except when considerably raised by rains or melting snows; it then discharges a part of its waters into New River, by the natural opening. I think the valley through which it passes, is nearly equal in extent and fertility to that of Craig's Creek.

The great elevation of the dividing ridge, the absence of anything like a tolerable supply of water, for several miles, on each side of the summit, and the very unfavorable and expensive kind of ground for a canal, for 5 or 6 miles, at the lower end of Sinking Creek valley, renders it ineligible, in my opinion, to 2924–H think of any water communication on this route, except a sluice navigation on Craig's Creek to the mouth of John's Creek, as before-mentioned.

Having early foreseen that it was not probable we should be able to accomplish the whole of the extensive surveys and examinations of water-courses, required by our instructions, and also to locate and estimate the expense of the three roads, mentioned therein, during the season; we believed our time would be most economized by giving our attention principally to the water-courses, until the further progress of our work should develope which of these routes would be most likely to be adopted as the connecting link between the navigation of the eastern and western waters; and then to bestow such attention to that route as time would admit, or circumstances might require. We therefore omitted making any survey, for the special purpose of a road between the "highest point of navigable water, on Craig's Creek, and New River, at the mouth of Sinking Creek;" but nevertheless took care to obtain such information on the subject as leaves no doubt on our minds, that a road may be made between those points every where within a limit of 5° of aclivity or declivity, without incurring any unusual expense incident to a mountainous country. This, we believe may be effected, either by taking the valley of John's Creek, for some distance and then crossing John's Creek Mountain, being a continuation of the Allegheny ridge, at a low price, into the valley of Sinking Creek; or by a route near the line of survey. The latter would accommodate the greatest number of inhabitants.

DUNLAP'S CREEK

Our levelling and survey, commencing at the mouth of this Creek, and terminating at the mouth of Howard's Creek, on Greenbrier River, was conducted along the present travelling road, passing up the valley of this Creek, 5 miles 116 perches, to the mouth of Ogley's Creek. In this distance, the road crosses the stream nine times. The valley is not wide, but affords several good farms. It is traversed from side to side by the creek, very frequently; and, being bounded by mountains on each side, the bank of the creek is very high and steep, where it impinges against those formidable boundaries, making it extremely difficult and expensive to carry either a road or canal on either side of the valley. The stream is too small to admit of a profitable sluice navigation, but is sufficient for the supply of a canal at all seasons.

The fall in the distance mentioned is 126 feet, or nearly 24 feet per mile. If it should be improved for the purpose of navigation, I think the most eligible plan would be to canal and lock
2924-I on the flat ground between the mountains, and cross the creek wherever it traversed the valley, by means of a dam. But as there will be 126 feet of lockage to provide for on any practicable plan, it will become a subject for consideration, whether the trade that may be calculated on, will justify so large an expenditure on so short a distance.

OGLEY'S CREEK

Our surveys passed through the ravine of this creek, from its mouth to its source. In dry seasons, it affords in no part a sufficiency of water for the purpose of a navigable canal; and therefore cannot be considered of any importance in relation to commercial transportation.

HOWARD'S CREEK

This creek, about six miles from its mouth, becomes large enough to supply a navigable canal, but too small for a sluice nagivation. The fall, in this distance, is 144 feet, averaging 24 feet per mile. There would be fewer crossings of the stream by a canal down this creek, than of Dunlap's Creek. But probably there would be some difficulty to encounter, on account of the porous limestone land through which it would pass. The fall per mile being nearly the same as Dunlap's Creek, and the trade it would accommodate probably about equal, the same question arises with regard to the propriety of improving it on any plan for the purpose of navigation.

There are on this stream, and its branches, some large tracts of very excellent land.

The distance between the mouth of Dunlap's Creek, on Jackson's River, and the mouth of Howard's Creek, on Greenbrier River, is, by the present road, twenty-eight miles sixty-eight perches.

The elevation of the lowest part of the dividing ridge, above the water of Jackson's River, at Dunlap's Creek, is 1240 feet; and, above the water of Greenbrier River, at the mouth of Howard's Creek, 402 feet.

The grounds between these creeks, and the facilities they present for improvement, &c. will be more particularly noticed in describing the road which has been located on this route.

GREENBRIER RIVER

This river measures, between the mouth of Howard's Creek and its junction with New River, 49 miles 273 perches.
2924–J Its average breadth is about 100 yards, and the fall in that distance 309 feet; averaging nearly 6 feet 3 inches per mile. It partakes largely of a characteristic common to rivers which derive their principal sources from the Alleghany ridges: that is, the very great inequality in the quantity of water discharged at the different seasons of the year. From the best information we could obtain, it appeared, that, for 6 or 7 months of the year, it was usually from 2 to 3 feet deep, on the gravel shoals, where it flows with a rapid current; and that it was subject to very great swells, from the melting of snows, or heavy rains, was visible by the signs left on the banks. In the latter part of summer and autumn, it becomes comparatively very low. We descended it in the latter part of the 6th, and beginning of the 7th Months; the season being remarkably dry, it was said to be lower than it had been before seen, at that time in the year; and that it was seldom lower at any season. Our boat drew about 9 inches water, and we were frequently under the necessity of opening long sluices through the gravel and loose stones, to obtain that depth. When I saw it, three months after, it was still considerably lower. It was then said to be lower than it had been since the settlement of the country. At the time of our passing down, if the water had been properly confined to narrow sluices, in the shallow places, it would have afforded every where, at least 15 inches in depth; and, when I examined it afterwards, about one foot.

Having, as before stated, been necessarily absent, whilst the upper part of the survey of this river was going on, I have only had a very partial view of the first 36 miles; and must, therefore, principally rely on Isaac Briggs' notes, and verbal statements, (obtained about the time of my joining the party,) for particular information relative to the bed of the river. From the knowledge derived from these sources, I think it probable that $400 per mile will make a complete sluice navigation, to the end of the 35th mile. At the great falls in the 36th mile, two locks will be necessary, of 7 feet lift each; and one of the same lift, at the little falls, in the 37th mile.

The 38th, 39th and 40th miles, have considerable descent; the water passing shallow over many ledges, and between loose rocks; the expense of improvement may be estimated at $600 per mile.

The 41st mile much better, and may be improved for $200.

?

From thence to the mouth of the river, nearly 9 miles, there are many places where little improvement will be necessary; and others, where the clearing of the bed for sluicing, will be expensive: the whole will probably average about $600 per mile.

2924–K The account will then stand thus:

For improving 35 miles at $400 per mile	$14,000
" 12 do. $600	7,200
" 1 do	200
3 locks, of 7 feet lift, 21 feet, at $625 per foot	13,125
	$34,525

I feel quite satisfied that this estimate will be fully adequate to the purpose for which it is made; that is, to making the most perfect kind of sluice navigation the whole distance, including the three locks in the 36th and 37th miles.

The bottom lands on this river are not very extensive; but there are generally more or less on one side or the other, and frequently on both.

The value and importance of this navigation will be best considered in conjunction with the upper section of

2924–L

NEW RIVER

The examination, levelling, and survey of which, from the mouth of Greenbrier, up to the mouth of Sinking Creek, was commenced on the 5th of the 7th Mo. 1819.

This is truly a noble river. Notwithstanding it was represented to us as being remarkably low, yet it afforded a superabundance of water for every purpose of internal navigation. The fall in this part of the river, considering the mountainous country it passes through, is comparatively moderate. The principal falls are, the Bull-falls, McDaniel's, Anderson's, Wiley's, Neilley's and Peter's mountain falls: none of which has ever been improved in the least degree; yet we ascended them all with our boat; though, in two or three instances, with considerable difficulty, after taking out our baggage, stores, &c. The breadth of the river from 2 to 300 yards, and the length of this section 55 miles 58 perches.

The fall and description of each mile, and the estimates of expense for effectuating a good sluice navigation of 2 feet, at all times, are as follows:

1st mile—Hard to ascend in places, but may be easily improved by 2 or 3 sluices, estimated at Fall 7. 11 f.	$400

2d mile—Requires no improvement worth noting. Fall 1. 61 f.
3d mile—Same as the last. Fall 2. 25 f.

4th mile—Wide and shallow, will require some improvement, estimated at ---------- $300
Fall 5. 07 f.
2925 5th mile—Nearly the same ---------- 300
Fall 6. 70 f.
6th mile—Excellent navigation. Fall 0, 22 f.
7th mile—Requires a little improvement estimated at ---------- 150
Fall 3. 11 f.
8th mile—Good navigation. Fall 1. 07 f.
9th mile—A small improvement necessary, estimated at ---------- 150
Fall 4. 04 f.
10th mile—The Bull falls are situated in this mile, in which there are about 3 feet fall in 60 yards, a good sluice and tracking path may be made on the eastern side for about ---------- 300
Fall 5. 83 f.
11th mile—This mile will be more expensive to improve than any of the preceding, the bed is generally composed of smooth rock and very wide; it will require some long sluices but not of the most expensive kind; they may be estimated at ---------- 800
Fall 8. 62 f.
12th mile—No improvement necessary worth noting. Fall 2. 31 f.
13th mile—Very good. Fall 0. 93 f.
14th mile—The same. Fall 1. 40 f.
15th mile—A long sluice will be necessary to overcome the difficulty in passing several continuous ledges, the expense may be about ---------- 500
Fall 6. 84 f.
16th mile—Very good. Fall 0. 42 f.
17th mile—In this mile occurs McDaniel's falls of nearly 4 feet in about 100 yards, a good sluice may be easily made on the west side and will probably cost about ---------- 500
Fall 4. 90 f.
18th mile—Very little improvement necessary. Fall 2. 41 f.
2926 19th mile—Anderson's falls are in this mile, rather more than 2 feet in 80 yards, also another of nearly the same, each of which will require a sluice, and may cost together ---------- 600
Fall 4. 78 f.
20th mile—A small fall succeeded by a long rapid shoal, which will require a long sluice, but not very expensive; it may cost about ---------- 500
Fall 7. 67 f.
21st mile—A part of the rapid continued, and a few other ripples, will require small improvements: (say) in the whole ---------- 200
Fall 4. 73 f.
22d mile—This mile requires a little improvement in places and may cost ---------- 100
Fall 3. 68 f.
23d mile—Requires no improvement worth noting. Fall 2. 40 f.
24th mile—Several ripples and shoals in this mile will require a little improvement by sluices very easy made, the cost of which may be about ---------- 200
Fall 5. 05 f.
25th mile—In this mile are Wiley's falls, composed of a ledge of rocks extending all across the river, the fall is nearly 4 feet and very abrupt. The sluice round the end which must be on the west side of the river, will be expensive; it will probably cost ---------- 500
Fall 4. 51 f.
26th mile—No improvement necessary in this mile worth noting. Fall 3. 79 f.
27th mile—The same. Fall 2. 15 f.
28th mile—Several ledges and some shoals which will require some sluicing, estimated at ---------- 300

2927 29th mile—¾ of this mile very good, but in the last ¼ occurs Neilley's falls, the greatest we have yet seen in the river. The whole fall is about 11 feet; six of which is nearly perpendicular, except a very thin sheet near one shore, which is more gradual, and over which (after unloading) with some difficulty, we ascended with our boat. A good sluice and tracking patch can be conveniently made along shore, and may cost about---------- $700

Fall in the mile 11.21 f.

30th mile—Excellent water. Fall 0.93 f.

31st mile—Commences with a very long rapid shoal; after which good water to the end. An easy sluice may be made on the west side and will probably cost---------- 400

32d mile—Good navigation. Fall 1.37 f.

33d mile—The same. Fall 1.06 f.

34th mile—A long shoal, but so regular that very little improvement is necessary. Fall 8.06 f.

35th mile—Generally good water, the few ripples that occur require but little if any improvement. Fall 3.93 f.

36th mile—Good water. Fall 2.96 f.

37th mile—Early in this mile occurs Peter's mountain falls. In the present state excessively hard to ascend, but by unloading our boat and very hard labour we succeeded in getting up. The abrupt fall at the lower end is about 5 feet; this is succeeded by several ledges above; making in the whole 9.56 f. This fall will cost more to improve than any we have past. The sluice must be on the west side and ought to be about ¼ long. To complete it in the best style, it will probably cost---------- 1,000

38th mile—Good navigation. Fall 1.41 f.

39th mile—More rapid than the last, but requires very little improvement. Fall 3.17 f.

2928 40th mile—In this mile, occurs a long rapid shoal, which ought to be improved by a regular graduated sluice, and may be estimated at---------- 400

Fall 8.45 f.

41st mile—No improvement necessary, worthy of note. Fall 3.36 f.

42d mile—The same. Fall 3.06 f.

43d mile—There is in this mile a fall composed of four limestone ledges, over which the water flows very rapidly, but not with an abrupt fall. It descends 5 feet in about 400 yards. An improvement by a graduated sluice, will be necessary, and may cost about---------- 400

Fall 6.66 f.

44th mile—A long shoal in this mile, which will require some sluicing, estimated at---------- 300

45th mile—In this mile there is a long rapid shoal, which ought to be improved by sluicing, and will probably cost---------- 400

Fall 9.13 f.

46th mile—Begins with a continuance of the last-mentioned rapid for a short distance, then good water to near the end, where there is a fall of about two feet: the improvements for this mile may be stated at---------- 200

Fall 5.38 f.

47th mile—No improvement necessary. Fall 3.53 f.

48th mile—The same. Fall 3.09 f.

49th mile—The most of this mile is swift water, but does not require sluicing. Fall 6.84 f.

50th mile—A continuation of swift water, and, in places more rapid than the last mile: some sluicing will be necessary and may be estimated at---------- 300

Fall 11.23 f.

2929 51st mile—Begins with a continuation of the shoal for a short distance; then good to near the end, where it is excessively rapid. An easy sluice may be made round a small island, and might cost about	$200
Fall 4.43 f.	
52d mile—Begins with a part of the rapid water just mentioned, and to which the last mentioned sum is applicable; the remainder of the mile smooth water. Fall 3.43 f.	
53d mile—Good navigation. Fall 1.32 f.	
54th mile—A long rapid in this mile, which ought to be sluiced in places, and may probably cost	300
Fall 9.64 f.	
55th mile—Smooth deep water. Fall 0.70 f.	
56th mile—At 58 perches in this mile, arrived at the mouth of Sinking Creek, where we terminated our survey. No improvement necessary. Fall 2.40 f.	
Total expense	$10,400

The whole fall in this section, f. 251.47, averaging f. 4.52 per mile.

The valley through which this part of the river passes, is very unequal in width. There is more or less of bottom land in almost every part; but, in several places, it widens out to a great exent, and affords several large tracts of first rate land. The second bottoms, and many of the hill sides, are also very rich.

Whilst engaged on this survey, great pains was taken to collect information relative to the character of the river, and the adjacent country, between the mouth of Sinking Creek and the Carolina line. This infirmation has been corroborated by all we have since received on the subject; and goes to establish the fact, in my mind, that the section alluded to, above the termination of our survey, (which measures about 130 miles by water,) is more
2930 susceptible of improvement than the section between Sinking Creek and Greenbrier; the falls being fewer in number, in proportion to the distance, and none of them so difficult to improve, as some we have described.

The counties of Montgomery and Wythe, through which this river and its branches extend, are known to be remarkably fertile; abounding also in iron ore, and manufactories of that article. Grayson also affords some good land, plenty of iron ore and one iron manufactory. Adjoining the two latter, to the west, is the rich county of Washington, on the waters of the Holstein, abounding with vegetable and mineral products. Gypsum or Plaister of Paris, of the best quality, is found here in great abundance, and salt cheaply manufactured to any requisite amount.

The quantum of utility resulting from the navigation of this river, will much depend on the degree of perfection to which the navigation in the James River valley, may be brought. If the best description should be effectuated, so as to reduce the price of transportation from Covington, at the mouth of Dunlap's Creek, to Richmond, to a comparatively small sum, in proportion to the value of the article transported; large quantities of bulky articles, such as tobacco, flour, hemp, cordage, pork and beef in barrels, bacon, and perhaps bar iron, and iron castings, would find their way down the New River, up Greenbrier, and across the portage to Covington, and thence to Richmond market; or, perhaps, at some seasons, down to Sinking Creek; then across the portage to Craig's Creek, and thence down to the main line on James River.

If a good sluice navigation only should be made on James river, we still might calculate on some of the most valuable of these articles with the addition of butter, ginseng and saltpetre, taking one of these directions to market; and in either event, goods of every description would pass from Richmond into these counties by this route. In addition to this, great benefits would result to the inhabitants of the neighbouring counties by the facilities such a navigation would afford to the mutual interchange of products and commodities, the growth and manufacture of their own country.

2931 The consideration of this branch of the subject will again be necessarily taken up in the general remarks towards the conclusion of this report.

On the 13th of the 7th month, we left Sinking creek, arrived at the mouth of Greenbrier river and commenced our examination, levelling and survey down the New river from that point on the 16th. The description, fall and estimate of expenses are as follows:

1st mile—Requires sluicing in several places and will probably cost Fall 6.42 f.	$300
2d mile—Very wide and shallow, but will admit of a very handsome sluice on the left, estimated at Fall 8.25 f.	400
3d mile—Nearly the same as the last, expense of sluicing estimated at	400
4th mile—About ¼ of this mile nearly the same as the two last, then for about 120 perches the descent becomes much more rapid, and in the present state of the water is dangerous to descend, and in all states must be excessively hard to ascend; the bottom is composed chiefly of flat rock. The remainder of the mile smooth water. A safe graduated sluice may be easily made through the rapid part of this mile, and will probably cost Fall 14.35 f.	600
5th mile—Good navigation. Fall 2.07 f.	
6th mile—In this mile are Brooke's falls, where the water falls 9 feet 8 inches in about 120 perches; the lower end very abrupt over broken rocks, which renders it very difficult and dangerous to pass in the present state of the water; a sluice and tracking path may be made on either side at an expense of about	1,000
It would however be a rapid one, and of course laborious to ascend; a lock would be a more eligible improvement at this place; for the construction of which the shores afford tolerable facilities. Fall in the mile 9.88 f.	

2932 7th mile—Begins with very deep smooth water, but a rapid with a fall at the lower end over a ledge soon occurs, succeeded by two or three small falls; then good water to the end. A tolerably easy sluice may be made for about---------------- $500
Fall 6.66 f.

8th mile—No improvement necessary worth noting. Fall 2.89 f.

9th mile—Nearly the same. Fall 3.11 f.

10th mile—This mile includes the great falls of New river, the whole fall in the mile is f. 32.27, about 2 feet of which occurs in a shoal above the principal fall which is over a ledge about 22 to 24 feet high, in the middle of the river; the balance consists of broken rapids for a short distance below. Notwithstanding the ground on the left side is very favorable for the purpose, yet the very great fall in so short a distance renders the sluicing plan entirely ineligible, 30 feet of the fall being in about ¼ of a mile. It is therefore my opinion that this great fall ought to be overcome by locks. The site is excellent for the purpose; 3 of 9 feet lift each may be made to answer the purpose by allowing some fall in a sluice above the first, and also some below the third; the whole expense of this mill will probably be-- 25,000

11th mile—Good water. Fall 1.17 f.

12th mile—In this mile there is a very swift rapid, but may be very easily improved by a sluice on the right side at a very small expense, (say)-- 200
Above and below this rapid the water is good. Fall 10.90 f.

13th mile—Very little improvement necessary. Fall 4.03 f.

14th mile—A brisk current in a part of this mile, a little of which may require some improvement, estimated at---------------- 100
Fall 5.31 f.

2933 15th mile—This mile ought to be improved by short sluices in two or three places, which will probably cost---------------- 150
Fall 6.33 f.

16th mile—In this mile, there is a long rocky fall, which will require considerable improvement. I think the expense may be estimated at-- 600
Fall 14.46 f.

17th mile—Begins with a small fall; several others also occur, which ought to be improved by short sluices. The expense of the whole may be estimated at-- 400
Fall 7.61 f.

The river appears to be changing its character. Above the great falls, the surface is remarkably free from rocks, except at a few falls. The bed is now more contracted, and a great number of rocks rise above the surface of the water.

18th mile—Several small falls, which will require short sluices, and may cost-- 200
Fall 4.41 f.

19th mile—Nearly the same as the last, except one fall, which is greater, and more abrupt. Expense of sluicing---------------- 350
Fall 7.47 f.

20th mile—Good navigation. Fall 0.65 f.

21st mile—Nearly the whole of this mile is good navigation; but, near the end, the water becomes very much contracted, and an excessively rapid current commences, called the winding falls. The mile terminates about 20 perches below the beginning of the fall, in which distance there is a descent of nearly four feet. The whole fall in the mile, 6.64 f.

22d mile—Begins in the last mentioned fall, which continues about 40 perches further; in which distance there is a fall of f. 6.52; making in the whole f. 10.46, in this rapid. In one place, the water, in its present low state, is confined to about 30

2934 yards; the current through the whole is excessively rapid; but a sluice and tracking way may be very conveniently made on the left short, which will make the passage of boats tolerably easy. Expense estimated at ---- $500
Fall in the mile, 11.30 f.

23d mile—Several rapid shoals in this mile, will require improvement, and may cost ---- 400
Fall 9.11 f.

24th mile—Nearly the same as the last, except that the expense of improvement may be greater (say) ---- 500
Fall 9.82 f.

25th mile—A very rapid and dangerous shoal, called Gid's defeat, occurs in this mile. A tracking path and long graduated sluice, on the left, is the most eligible mode of improvement, and may cost ---- 600

The remainder of the mile tolerably good. Fall f. 15.31, about f. 13 of which is in the rapid above mentioned: the distance about 40 perches.

26th mile—Requires some improvement; estimated at ---- 250
Fall 6.44 f.

27th mile—Good navigation. Fall 0.20 f.

28th mile—In this mile, occur three distinct falls; one of them dangerous to descend. They will all require sluicing, and will probably cost ---- 700
Fall 16.09 f.

29th mile—No improvement necessary, worth noting. Fall 5.80 f.

30th mile—In this mile are several rapids, which will require improvement; estimated at ---- 600
Fall 13.43 f.

31st mile—Early in this mile, occurs a long rapid, terminated
2935 by a fall over rocks at the lower end. It may be improved by a sluice taken through a small point of rocks, on the right shore. The water is then very deep and smooth, to near the lower end, where there is another considerable rapid. The expense of improving the two, may amount to ---- 700
Fall 15.12 f.

32d mile—Begins with a short, but excessively swift broken rapid. The fall is about 5.50 f. in little more than 100 yards. It must be improved by a sluice and tracking path, which may probably cost ---- 400
Fall f. 8.

33d mile—Several rapids and two small falls, over ledges, in this mile, all of which may be made tolerably easy by sluicing. The expense will probably be ---- 500
Fall 10.46 f.

34th mile—All good water, except one gravel shoal. The expense of improvement estimated at ---- 100
Fall 4.83 f.

35th mile—Good navigation. Fall 1.20 f.

36th mile—In this mile occurs the Buffalo Falls, consisting of a long gravel shoal, with some broken water by rocks at the lower end. The navigation may be made tolerable by a sluice, that will probably cost ---- 450
Fall 14.60 f.

37th mile—Begins with a short rapid, which will require a little improvement; also a small fall just below; the two may amount to ---- 150
Fall 6.12 f.

38th mile—In this mile there are several sheets of smooth water, but there are two rapids and a rocky fall to improve; these may be estimated at ---- 500
Fall 13.05 f.

2936 39th mile—Several small rapids in this mile but none that require improvement; a very small fall near the ned may cost about ---------- $50

Fall 6.95 f.

40th mile—Most of this mile is good water; but a pretty long rapid occurs near the lower end which will require a sluice, and may cost ---------- 200

Fall 5.85 f.

41st mile—In this mile are several rapids which require improvement; the expense may be estimated at ---------- 450

Fall 10.25 f.

42d mile—Some rapids with falls over rocks at their lower ends occur in this mile; they may all be made tolerably good by sluices, which will probably cost ---------- 500

Fall 10.03 f.

43d mile—Begins with very deep smooth water; at about 1/4 commences a rapid, shallow and difficult to pass (at this state of the water) near the lower end: it can be easily improved by a sluice on the right side, estimated at ---------- 250

Then good water to the end. Fall 7.81 f.

44th mile—Mostly tolerable water, except a fall near the lower end that may be conveniently sluiced for about ---------- 150

Fall 7.83 f.

45th mile—Commences with a rapid that is succeeded by several others; to overcome which sluices will be necessary; particularly for one near the lower end that is terminated by a rocky fall, where the river is contracted to about 30 yards in width, and will be expensive to improve on the right, where the sluice would be most likely to keep open; the immense rocks and apparent violence of the freshets forbid the attempt on the left; there will be some liability to its filling with gravel, otherwise the site
2937 on the right would be good. I do not think however that this effect would often take place, and then but partially: It would be nearly straight and very long, and of course expensive; though there would be no blasting of rocks. On the whole this mile will cost more to improve than any we have past, except where a lock or locks are recommended. To render the navigation tolerably good, the expense of the mile ought probably to be estimated at ---------- 1,200

Fall 19.75 f.

46th mile—Mostly good water, except one fall consisting of three ledges, which will require a sluice and tracking path, that will probably cost ---------- 500

Fall 8.90 f.

47th mile—At 130 poles in this mile is Bowyer's ferry, above which there is only 6 inches fall and consequently requires no improvement ----------

Total cost of improving the section from the mouth of Greenbrier to Bowyer's ferry ---------- $39,850

Total fall in this section 402.76 f.

The remainder of the 47th mile continues good to the end, except one fall, the improvement of which may cost ---------- 200

Fall 5.08 f.

48th mile—Several rocky falls in the upper part of this mile. The very confined limits of the bed, and the immense masses of rock on the shore in places forbid the idea of sluicing. Two modes of improving present; the one is by a canal nearly ½ mile long on the left shore with two locks at the lower end, the other is by removing a few of the worst projecting rocks near the shore and filling some of the chasms between the rocks on the shore so as to form a tolerable footway or tracking path for hauling by a rope, fastening in the rocks at particular places ring bolts, 2938 or iron pins for security. Under all circumstances perhaps the latter ought to be adopted. This will probably cost $500

A canal may be built and locks secured from injury by freshets, but the canal would be very expensive, as it would require one great wall the whole distance, and in some places two. Fall in the mile 16.95 f.

49th mile—A considerable part of this mile is good water; then a fall round which a sluice may be conveniently made on the left shore; after this another rocky fall occurs that cannot be easily sluiced; the tracking plan must therefore be adopted. The expense for this mile is estimated at 700

Fall 17.11 f.

50th mile—In this mile are several tremendous falls, or rather different parts of the same fall; immense rocks have fallen in on both sides, so as to contract the water to a very narrow space, in one place estimated to be not more than 40 feet, and at this low state of the water a rock appears about the middle even of this narrow channel; but the water being of course very deep between the rocks at this place it is not so dangerous to pass as at several others where it is wider, and the water completely broken into white foam, from shore to shore by the dashing and friction occasioned by the rocks below; something may be done to render the passage downward safe at these places, and also those before mentioned; but towing only can be relied on as the means of ascending. The expense of improving this excessively rugged mile may be estimated at 1,200

Fall 26.16 f.

51st mile—Of the same character as the last, but the falls in one or two instances more rocky and dangerous to descend than any we have passed. In descending one of these of 13 feet, the boat was driven with great violence on a ledge and stuck fast
2939 in a very perilous situation, the water being very deep and excessively rapid on both sides, we could find no means of relieving her but by getting a part of the baggage on shore by means of ropes, which had to be again transported a considerable distance over, between and under huge rocks, forming as rough a mass as the mind can well conceive such materials can possibly exhibit. The fall in this mile is also great, and must be improved in the same way as several of the last; (that is,) by putting one of the shores in such a state that a towing rope may be every where carried by men, and by removing some prominent rocks, and in places making short sluices where circumstances will permit, for the passage of the boats. The expense is estimated at 1,600

52d mile—Near the beginning of this mile a great and dangerous fall occurs, and a considerable one near the lower end; the remainder tolerable water; expense of improvement may be estimated at 1,000

Fall 19.75 f.

53d mile—Nearly ¼ good water, then a great and rough fall of 15 feet in about 200 yards; the water then tolerable to the end; expense of improving not so great in proportion to the fall as some of the former miles, in consequence of the shores in places being less rugged (say) 600

Fall 17.16 f.

54th mile—Early in this mile is a rocky fall of 10 feet; the whole of which except a few inches is in the distance of about 100 yards; then some good water; after which, another fall; then, good to the end; expense of improvement 1,000

Fall 18.66 f.

2940 55th mile—Begins with good water, then three abrupt falls in close succession, or rather different parts of the same fall; then good water to near the end, where there is a very rough and abrupt fall; expense of improvement estimated at $1,200

Fall 20.33 f.

56th mile—A fine sheet of water for about ¾; then a long fall to the end; but not so abrupt nor dangerous as many others; expense of improvement 800

(these falls are called Claypole's shoals)

Fall 15.39 f.

57th mile—Begins with a part of the fall last mentioned, after which are two or three other small falls that may require some improvement; expense for the mile may be stated at 600

Fall 11.69 f.

58th mile—Begins with good water; and continues to near the end, where there is a fall of 9½ feet in about 150 yards; this may be improved in part by sluicing, and in part by a tracking way; the expense is estimated at 400

Fall in the mile 10.78 f.

59th mile—Good water except one fall over ledges of rock; which may be improved by removing some rock, a little sluicing and making a tracking path; which will probably cost 500

Fall in the mile, 9.28 f.

60th mile—In this mile are several falls over ledges, which will require the same kind of improvements as those mentioned for the last mile, they may be estimated at 600

Fall 13.42 f.

61st and 62d miles—Begin with a considerable fall over a ledge, then after a short distance of smooth water another occurs of about the same perpendicular fall, (viz. 6½ feet,) but rather more gradual; then another small sheet of good water, after which commences a very long and great fall of a character rather

2941 different from any that we have past. Some of those were principally composed of ledges of rocks across the bed of the river forming abrupt and sometimes perpendicular falls of different heights. Others were formed of large pebble, making the descent more regular but often producing excessively rapid water; (the latter description has generally been denominated rapids in the preceding notes;) both of these were however frequently interspersed with rocks rising above the surface of the water. But the fall that commences in this mile, appears to be mostly formed by a loose jumble of detached rocks of various sizes, that have either been precipitated from the steep sides of the adjoining mountains, or lying in their original situations have had the earth removed from about them by the water, and the cavities thus formed filled in part with stones and rocks of a smaller size and rounded like pebbles, (though many of them are three to four feet diameter,) which have been brought down by the current. The original rocks are so numerous and large that at a small distance they appear to occupy the whole bed of the river, and entirely conceal the water from view. The passes between are of course extremely crooked, and the water flowing with very great velocity; they cannot be passed by a boat of the size of ours, (which was 56 feet long and 7 wide) with any loading without almost a certainty of being dashed to pieces. We were therefore under the necessity of taking out our baggage and stores in order to lighten the boat as much as possible; these we had to carry over excessively rough rocks to the lower end of the falls (as we then supposed), but after a few perches of moderate water, on sudenly turning a point, we were again surrounded by rocks as large as Hay stacks, and some as large as moderate sized dwelling-houses. With great difficulty and danger however we

2942 worked our way through them. These rocks present the most formidable bar to improvement of any thing we have yet seen. To form a passage through them near the shore so as to render the descent quite safe and also to give a perfect command of ascending boats, by means of a tracking way, &c., I should suppose would require for these two miles---------- $5,000

Fall in the 2 miles 60.68 f.

63d mile—A continuation of the same kind of rude bed and savage shores, with encreased difficulty of descending; at one place we were not only obliged to take out our baggage and stores, but also to take down our cabin, and transport the whole over the rocks; after the boat was thus lightened, by the exercise of skill and dexterity in the boatmen that were truly astonishing, they succeeded in passing a very crooked course through these great rocks over excessively rapid water; but not without imminent danger. This fall is succeeded by about 100 poles of smooth deep water quite clear of rocks, but then occurs a fall of still greater difficulty to pass than any preceding it. We had again to unload and take down our cabin, and then get deep into the water behind a rock and hold the boat by a rope attached to the stern, to prevent her from being dashed to pieces against rocks at a short distance below, and exactly in front of a narrow opening through which she had to pass, over an abrupt fall of three feet. After passing two or three such falls the load and cabin were again taken on board; and carried a very short distance, then again put out on the rocks, and the boat passed down another dangerous fall in the same way; just below which the mile ends. The expense of improving this mile may be estimated at-------- 2.000

Fall 17.48 f.

64th mile—Begins with good water, than a fall of 7, feet, after which good navigation to the end; the expense of
2943 improving-- 400

Fall 8.24 f.

65th mile—Begins with a fall of about three feet; just below which the river suddenly expands from less than 100 yards in width to about ¼ of a mile, and smooth and deep to the end of the mile. The small fall at the beginning will require a little improvement which may probably be done for---------------------------- 250

Fall 3.34 f.

66th mile—A continuation of wide deep water; at ¼ passed the mouth of Gauley river, below which the river is known by the name of Kanawha, and continues wide, but becomes shallow with some fall, no improvement necessary in this mile. Fall 2.78 f.

67th mile—The river still continues wide and most of the width shallow; but the navigation tolerable. Fall 4.45 f.

68th mile—At fifty perches in this mile are the great falls of Kanawha; which we find to be 20.37 f. where we unloaded our boat, took down the cabin, hauled her over the rocks and launched her into the deep water below Stockton's saw mill. This is one of the most convenient situations for the application of water power I have ever yet seen.

Total expense from Bowyer's ferry to the falls of Kanawha-- $18,850

Total fall from the mouth of Greenbrier to the foot of the falls of Kanawha 743.77 f.

As we descend the valley of the New River from the mouth of Greenbrier it becomes gradually more contracted, and its mountain boundaries higher and more rugged; several small tracts of bottom land are found in the first 10 or 12 miles, but from thence to Bowyer's ferry, 10 acres of good land in a body rarely

occurs. About 5 or 6 small cabins are the only human habitations that are to be seen in 35 miles. From the mouth of Man's creek ¼ below Bowyer's ferry to the mouth of Gauley river 18 miles, not a trace of human industry or art is any where
2944 to be seen, except a part of a small field which approaches
the river at the mouth of Mill creek. Indeed for a large portion of that distance a spot of earth of sufficient dimensions for the ground plan of a moderate sized dwelling house is rarely to be seen.

The Sewell mountain rising in the midst of a broken mountainous country, presents an exterior different from those around it. The rise from its base is very long and of course less precipitous than most others; and instead of a narrow ridge on its summit, the form that the surrounding mountains generally assume, it spreads out, and exhibits to the view a considerable extent of very high undulating land, the spurs projecting from it in various directions bearing different names. For more than 40 miles, the New river has worked its way through this great tract of elevated land: above Bowyer's ferry the appearance from the river is that of high mountains on each side, indented by the water courses which rise in the high grounds beyond the view, and descend by rapid cascades to the river. In places perpendicular cliffs of great height are seen, but the general appearance is a steep slope covered with trees; contracting the water to an average of about 120 yards. Below Bowyer's ferry the scene is considerably changed; tremendous cliffs from 5 to 7 or 800 feet in height generally form the boundaries of this frightful ravine: these are so continuous that in one part for four miles in extent, the river is entirely unapproachable by man from either side. Confined within these rugged limits to a very narrow space, the water sometimes rises to the extraordinary height of 50 feet, notwithstanding the very great fall in its bed.

In making the surveys of the Greenbrier and New rivers, the alternatives mentioned in our instructions were not forgotten, but as it was demonstrably clear, that surveys of, and estimates for all the different descriptions of navigation mentioned could not be made by us in one season, and comply with our other important duties; we selected according to our own judgment, that mode which we believed the rivers themselves, and other circumstances
connected with the navigation pointed out as most eligible,
2945 leaving the others to be taken up at a future time, if it
should be deemed necessary. But notwithstanding we have thus limited the field of our labours, yet we hope such information will be derived from our reports as to enable the board to determine whether further surveys and estimates may be useful.

It may be observed, that so far as the sluicing plan has been recommended, the estimates are made with a view to the sluice in every instance being made contiguous to one or other of the shores; so that the boatmen may always avail themselves of the advantage of a towing line when the rapidity of the current requires it.

And to what has been already said relative to the tracking plan, recommended for the more rugged parts of the river, where sluices cannot be made, nor setting poles used with advantage, it may be added, that by the use of a block and pulley attached to the boat to be used at particular places, the power of a few men will be adequate to the towing or warping of a loaded boat up any current that will probably occur. But it must be remembered, that this description of navigation is only calculated for comparatively low water, that is, from the state in which we saw the river to about 10 feet higher, which may be about the usual spring heighth. In freshets any navigation in the bed of the stream must be dangerous in consequence of the violence of the current and the roughness of the water. The construction of an independent canal along this ravine from Bowyer's ferry to the falls appears to be quite inexpedient, if not utterly impossible. But I think it is possible on the left or west side to level the fallen rocks at the foot of the cliffs, just above high water mark, so as to admit of a railway the whole distance. It would, however, be very expensive and will probably be left for posterity to execute.

NEW RIVER

On the 28th of the 8th month, I left Abingdon, for the purpose of viewing that part of the New River, mentioned in my instructions, and arrived at Captain Newell's ferry, opposite to the
2946 Lead Mines, on the evening of the 29th. The next morning, in company with Hugh P. Taylor, commenced the examination.

The navigation is good for about 3 miles below the Lead Mines: there occurs a small shoal that will require a little improvement; immediately below this, there is another, where the water falls about 5 feet in 200 yards, and will require a sluice on the left shore, and a low wing dam, to turn in the water. I am of opinion that $1,000 will be sufficient to effect the improvement of these two shoals.

About 5 miles below the Mines, are Foster's Falls. It appears the fall may be about 18 feet in half a mile, divided into 9 or 10 parts, by small ledges of rocks, none of which occasions a perpendicular fall, and but very little appearance of rock above water, so that the passage is perfectly safe to descend, in almost any part, except when the river is low.

But there will be some difficulty in procuring an easy ascending navigation. The left side presents the greatest facility for a graduated sluice, over some of the upper ledges, but near the lower end of the fall on that side, it would be rapid, and the rocks very smooth for polling. It would, however, be close in shore, and some advantage might be taken of towing lines, ring bolts in the rocks, &c. On the right shore, there appears to be excellent ground for a canal and locks, if that plan should be thought most advisable. But as we had no boat to cross over, so as to examine both sides critically, I cannot say with certainty which side ought to be adopted. If a sluice on the left side will answer the purpose, I think it may be made for $1,200.

Between these falls and the mouth of Reedy creek, there are four small falls, the last of which is called Deer falls, and is the worst of the four. They all consist of smooth ledges, making swift water, but not dangerous, nor very difficult of ascent; they may, however, be a little improved for a very moderate sum, say $150 each.

Just below Reed creek, is Reed island, at the lower end of which is a small fall of about one foot, over a ledge of rock, through this there is a sluice close to the right shore: then 2947 smooth water for about two miles, where there are small ripples opposite to Pine run, which require very little improvement. In the next 4 or 5 miles, there are three or four ripples that may require slight improvements. A small island then occurs, near to the left shore; opposite to which, there is more fall than for several miles above, in the same distance. It is, however, so regular, that it presents but little difficulty to ascending, and none to descending boats, except that a natural sluice may require a little opening.

From Reed creek to the lower end of this island, I think $600 will do all that is necessary to be done.

From this island, for several miles down, to Ross's falls, there is but little fall, but the river is generally wide, and in places, rather shallow; a few of the ledges will require opening; the expense of which may be estimated at $500. Ross's falls are situated nearly opposite to Captain Ross's house; the fall is about 2½ feet in 50 yards, and will require a graduated sluice on the right side, which will probably cost $700. Then for about two miles tolerably good, but a few ledges may require some improvement, for which may be allowed $300. Then occurs a long fall, probably nearly equal in the whole, to Foster's before described. It was impossible, without a boat, to decide with certainty, how it ought to be improved; but the most probable plan appeared to be, by a graduated sluice near the right shore, or rather, several short ones, the expense of which may be estimated at $1,200. This fall is just above the dividing line between Wythe and Montgomery counties.

Below this fall, there is nearly a mile of good water; after which, commences a long fall, composed of a number of ledges in succession, none of them large, but several will require improvement by opening passages, constructing wings, &c. I think $1,000 ought to be allowed for this purpose. Then to Peak creek, there is but little fall, but the river is wide, and in places shallow; to improve these $300 will probably be required. About the mouth of Peak creek there are several islands and some fall; the sum of $500 may be estimated for procuring a
2948 good navigation through them. Then good water to the late Col. Trigg's farm; opposite to which, there is a fall of two to three feet in 200 yards. Through this fall it will probably require $400 to procure a passage. There is also another small fall, about the lower end of this farm, which will require but little improvement. Then good water to within half a mile of English's ferry, where there is a fall of about 3 feet in [illegible]00 yards, and a quarter of a mile of swift water below. The upper part requires improving, which may cost $400.

From English's ferry to near Pepper's ferry, there is no obstruction to navigation worth noting.

A short distance above the latter, there is a fall of nearly 8 feet in a quarter of a mile, but the descent is so regular, that loaded batteaux might then have descended near the right shore with perfect safety, and ascended with light loads: and with water a little higher, boats might ascend in every part, for there are no projecting rocks. But to make it quite easy to ascend, there must be a graduated sluice on the left shore, for nearly half a mile; this would also be the downward passage in very low water: and would cost, I think, at least $1,000. The navigation is then good to Shell's falls, 2 miles below the ferry. These present a more serious obstruction than any above. The fall is estimated at 7 feet in less than 200 yards, and at the lower end very abrupt and broken; there is, however, on the right side, which is much the longest end of the falls, a gravel bed that rises above all the ledges; over this the water flows with a tolerably regular shallow current. A sluice might be made on this side that would be quite easy; but it would be liable to fill with gravel, unless it was well guarded on the river side. To effectuate such a sluice would probably require an expense of $1,500. Either this plan must be adopted, or a lock must be constructed on the left side, which would cost a much larger sum.

From this place round the Horse-shoe and quite down to Michael Brown's, there are only a few inconsiderable ripples: but a short distance below his farm, the river becomes wide
2949 and shallow, with a moderate fall; it will probably require improvement in places down to the gap mountain falls, a distance of 3 miles, for which may be estimated $300 per mile.

The falls just mentioned occur at the passage of the river through the Gap mountain, and at the line between Montgomery and Giles counties. The fall is about 6 feet in 200 yards. It appears from the best view that could be taken of it without a boat, which was from the left shore, that the plan for improvement will be by a graduated sluice on the right side; this may be made much longer than the fall, and I believe will very well admit of a tracking way on the shore, which will make it very easy. The expense may be estimated at $1100. Ledges commence a little below the principal fall, and continue in succession for a mile or upwards: no one of these presents any great obstruction to navigation, but taken collectively, they form a very considerable fall, and in order to get a good passage through them, in an easy direction, it will probably require the expenditure of $600. Thence to Sinking creek, the navigation is generally good; there are, however, a few ledges that may require some expense; I believe $600 will be amply sufficient for the whole.

In this examination, I was considerably aided by the map and field notes of a survey of the river, lately taken by James Caruthers and Hugh P. Taylor: The latter of whom accompanied me with these documents the whole distance from the lead mines to Sinking creek. By that survey this distance is 68 miles 52 rods.

* * * * *

2949½ Before I close this report, it is but justice to add, that our assistants, engaged in the arduous labors of the late season, acquitted themselves, in the several duties assigned them, with faithfulness and propriety. Thomas Mifflin Ladd, of this city, has become expert in the use of the levelling instrument, and with further practice, and the experience of a few more years, may become useful to the community. The same may be said of Hugh P. Taylor, who, although a young man, is in possession of much topographical knowledge of the interior of this State. Moncure Robinson of this city, is eminently entitled to our respect. Without any compensation, whatever, except the payment of his expenses, he accompanied us nearly the whole season, and always performed the duty of a hand, without shrinking from the most laborious tasks. He possesses much information for his age, and a mind calculated to render him useful to his fellow-citizens.

I also feel it a duty to say, that our two principal boatmen, captain Robert Creasey and Isham Scruggs, are entitled to great credit, for their good conduct whilst in our employ; and particularly for the deliberate judgment, courage, skill and dexterity, exhibited in conducting our boat through the long and tremendous rapids of New river; which, considering the size of our boat, I must believe, was a voyage fraught with as much difficulty and danger, as ever was completed with perfect safety.

With great respect, this Report is submitted, by

THOMAS MOORE.

REPORT OF THE U. S. ENGINEER DEPARTMENT SECRETARY OF WAR, YEAR 1877

(pp. 62; 331–332)

7. Improvement of New River, from the lead-mines in Wythe County, Virginia, to the mouth of the Greenbrier River, West Virginia.—A survey of this portion of the New River was made in 1872. A report was printed in the annual report of the Chief of Engineers for 1873. Two estimates were submitted—one looking to an improvement to facilitate the navigation by the keelboats now used, at a cost of $100,000; the other contemplating a 3-foot steamboat navigation, to cost $1,000,000.

The first appropriation for the work was $15,000, August 14, 1876; but it was not made available until May 1877. As this appropriation was insufficient for a general improvement, it seemed necessary to confine what should be done at present to a limited portion of the river, and to that scheme which involved the least expense, viz., for the keel-boats now in use, it being the understanding that what is first done in the smaller improvement should be arranged with a view to its utilization and adaptation some future day, when the means provided shall suffice to enter upon the improvement of the river for light steamboats.

It seemed also expedient that the first portions of the river treated should be in the vicinity of New River bridge, in order to facilitate communication of at least a portion of the country through which the river flows with an existing outlet east and west—the Virginia and Tennessee Railroad—which is itself in connection with the whole system of rail and water intercommunication of the country.

It is expected that the work will be completed, as far as the funds available will allow, before the close of 1877.

Amount appropriated by act approved August 14, 1876	$15,000.00
July 1, 1877, amount expended during fiscal year	78.25
July 1, 1877, amount available	14,921.75
2961 Amount (estimated) required for completion of existing project	85,000.00
Amount that can be profitably expended in fiscal year ending June 30, 1879	50,000.00

F 7

Improvement of New River, From the Lead-Mines, in Wythe County, Virginia, to the Mouth of Greenbrier River, West Virginia.

A survey of this portion of the New River was made in 1872, and a report submitted January 9, 1873, which may be found in print in the Annual Report of the Chief of Engineers for 1873, beginning at page 852. Two estimates were therein made for the improvement of the river.

The first looked to facilitating the navigation by the keel-boats now used, at a cost of $100,000. This was to be accomplished by constructing slight deflectors or dams of rock and brush, in order to concentrate the volume of the water and increase the depth over the shoals from the present average of about 12 inches to about 2 feet, which could be done without too much increase of velocity. And some of the falls which are almost always vertical and of an average height of about 4 feet, could be greatly improved by blasting sluices through them about 30 feet in width and of an average length of 50 feet. In many cases the falls have already natural chutes or sluices through them susceptible of a similar improvement.

But there is a strong demand for the introduction of steamboats on the river. Hence the second estimate, which was for a 3-foot steamboat navigation, to cost $1,000,000. It was supposed that light-draught steamboats could, for short distances, ascend a grade of 1 in 400, with a current of 5 miles an hour. It was therefore proposed to excavate sluice-ways 90 feet wide and 3 feet deep through all shoals having a grade not exceeding 1 in 400. Where the grade exceeds this, low regulating dams were proposed, with sluices having a fall not exceeding 1 foot at each. In several cases dams were to be introduced containing locks, and in two other places lateral canals.

The first appropriation made for this improvement was $15,000, August 14, 1876, but authority for its expenditure was not given until in May, 1877. As this appropriation was insufficient for a general improvement, it seemed necessary to confine what should be done at present to a limited portion of the river and to that scheme which involved the least expense, viz, for the keel-boats now in use; it being the understanding that what is first done in the smaller improvement should be arranged with a view to its utilization and adaptation some future day, when the means provided shall suffice to enter upon the improvement of the river for light steamboats.

It seemed also expedient that the first portions of the river treated should be in the vicinity of New River Bridge, in order to facilitate communication of at least a portion of the country through which the river flows with an existing outlet east and west, the Virginia and Tennessee Railroad, which is itself in connection with the whole system of rail and water intercommunication of the country.

Captain J. W. Cuyler, Corps of Engineers, has been assigned to the immediate supervision of this work, which is expected to be completed, as far as the available funds will allow, before the close of 1877.

MONEY STATEMENT

Amount appropriated by act approved August 14, 1876	$15,000.00
July 1, 1877, amount expended during fiscal year	78.25
July 1, 1877, amount available	14,921.75

Amount that can be profitably expended in fiscal year ending June 30, 1879	50,000.00

2952 *Government exhibit 34*

Report of the Chief of Engineers, Year 1878

(pp. 69; 495–499)

8. **Improvement of New River, from Lead Mines in Wythe County, Virginia, to mouth of Greenbrier River, West Virginia.**—The plan adopted for the improvement of this river contemplates a channel-way 30 feet wide and 2 feet deep below the lowest water, suited for the keel-boats now in use, but at the same time capable of utilization and adaptation, at some future day, in a further improvement of the navigation for light steamboats, should means be provided therefor.

The season's work was commenced at the bridge of the Atlantic, Mississippi, and Ohio Railroad, and carried continuously upstream toward the lead mines, 9 miles, as far as Falls Branch Falls, resulting in the removal of all obstructions in that portion of the river to the adopted depth and width. The work was done by hired labor, and the purchase of material in open market.

The ledges and detached bowlders were blasted out under water, and the debris scoured out of the channel and built into the facings and heads of the wing-dams and training-walls; the gravel shoals were excavated through, and materials made into the heartings of these constructions. By these means sluices and chutes, affording an unobstructed water-way, were made, without increasing insurmountably the velocity and volume of the water in them. The plan adopted has proved its capability to accomplish its design. It is, therefore, proposed, during the ensuing year, to continue it, with slight modifications, working still up the river, but on an enlarged scale, so as to open up fully another 10 miles of river.

July 1, 1877, amount available	$14,921.75
Amount appropriated by act approved June 18, 1878	15,000.00
	$29,921.75
July 1, 1878, amount expended during fiscal year	6,492.26
July 1, 1878, amount available	23,429.49
2953 Amount (estimated) required for completion of existing project	$70,000.00
Amount that can be profitably expended in fiscal year ending June 30, 1880	35,000.00

F 8

UNITED STATES ENGINEER OFFICE,
CAMP NO. 1, FALLS BRANCH, NEW RIVER,
Pulaski County, Virginia, July 1, 1878.

GENERAL: I have the honor to submit herewith the annual report of operations for fiscal year ending June 30, 1878, for the work of river improvement under my charge temporarily.

Very respectfully, your obedient servant,

JAS. W. CUYLER,
Captain of Engineers.

Brig. Gen. A. A. HUMPHREYS,
Chief of Engineers, U. S. A.

IMPROVEMENT OF NEW RIVER FROM LEAD MINES IN WYTHE COUNTY, VIRGINIA, TO THE MOUTH OF GREENBRIER RIVER, WEST VIRGINIA

Having been assigned by my predecessor in charge of the work, Maj. W. P. Craighill, Corps of Engineers, to its local charge, June 28, 1877, I took station at New River Depot, Pulaski County, July 6, after having first visited Wytheville, in order to obtain some necessary information, and make certain needed arrangements, proceeding thereupon to inaugurate the work.

The project of Major Craighill, which was to form a clear channel, 30 feet wide by 2 feet deep, below minimum low-water,

through the rock in place, constituting the "falls" and "ripples" in the river, and the coarse gravel constituting the "bars," such channel to be adapted to the existing navigation, i. e., "keelboats" or batteaux, with an average carrying capacity of 8 tons, on a draught of water 21 inches, and to be so arranged as to be capable of utilization, in the more general and permanent project contemplated, for a channel 90 feet wide by 3 feet deep, suitable for light-draught steamers, having been approved by the Chief of Engineers, June 7, 1877, I made a reconnaissance of the
2954 portion of the river extending 20 miles above and 7 miles
below the determined-upon initial point of the work, i. e., the bridge of the Atlantic, Mississippi and Ohio Railroad spanning New River, between July 1 and 15, 1877, with a view of fixing the several localities for work.

The engineering as well as local considerations, pointing to the advisability of carrying the work forward progressively entirely upstream, a gravel "flat" 16 feet long by 8 feet beam and a "stone-boat", with 4 canoes, were built; 2 keel-boats 50 feet long by 7 feet 9 inches beam, were hired for quarters and transportation; boats, tools, and supplies collected, and a working force organized by July 23, when work was begun on the four ripples next above the railroad bridge and distant from it from 200 to 600 yards.

The nature of the work involved, for the removal of the rock in place, blasting under water as the method of working; "juniper-drills" were decide upon, as from the overhanging of the ledges and the fact that the workmen had to stand in quick and strong water, in order to drill, suitable "churn-drills" would have proved too unwieldy and heavy; holes of 2 inches diameter were fixed on as best suited to the work, and these were drilled on an average 3 feet below bed, and spaced as nearly equally apart as the lay of the rock would permit, varying from 2 feet to 8 feet.

In view of the facts that the labor of the country composing the force was entirely ignorant of the method of handling dynamite or "giant-powder," and that I had not time before leaving Baltimore, my nearest point of supply for such explosives, to arrange for procuring them, I decided upon the use of the "Orange" blasting-powder, and after several experiments with tin cartridge-cases and gutta-percha and india-rubber patent tubing for same, finally selected the "pitch bag" cartridge, a cylindrical bag of close ticking, made around a wooden core, and immersed in a mixture of pitch and tar of the proper consistency, with a piece of "double-tape" fuse inserted in the mouth and choked, which selection was followed by the best results, not 1 per cent. of blasts failing, as due to the cartridge, during the two and one-half month's opera-
2955 tions of 1877. For the removal of the gravel-bars the pick
and shovel were used.

Lying as the work did in a country sparsely peopled and relatively inaccessible, it became a necessity to feed and tent the entire working party. Working on the above plan, a party of 50 were worked during the season of 1877.

After finishing the four ripples above referred to to width and nearly the proper depth, and building training-walls and wing-dams at them with the rock excavated, a fifth ripple—a narrow ledge offering no serious obstruction—half-way between Ripple 4 and "Jones" (for reference to localities, vide survey-map of 1872), was cut through; a gravel-shoal 80 feet in length, opposite "Jones" was dug through, and lacking but a few inches of the requisite depth; a "gathering-dam," extending 110 feet up river, was put in, raising the water to the proper level without blasting, and the main work of the season reached the passage of Ingle's Falls 3½ miles above the railroad bridge.

These falls consist at head of eight distinct ledges of hard gneiss rock, running straight across the river, successively, for 600 feet, barring back a pool extending up 3½ miles, with from 9 feet to 3½ feet water in it; below these ledges for 350 feet extend large detached bowlders, through which the natural sluice winds with great velocity of flow, succeeded by a gravel-shoal 240 feet in width, the "falls" being terminated by another gravel-shoal 300 feet wide just above the broken-down piers of the old Virginia and Tennessee Turnpike Bridge, in themselves, as they stand, an obstruction to descending boats, which latter require the removal of certainly the westerly pier of the two; the stretch of river embraced in the "falls" is 1,010 yards, and the total fall in this distance 7.11 feet, the width of low-water bed at head being 700 feet, narrowing suddenly at the lower "gravel" to 530 feet. Three-fourths of this fall of 7.11 feet occurs in the upper 900 feet through rock; and the gravel-shoals below, as well as the generally rough and irregular nature of the entire bed of the lower section, are undoubtedly due to the abrupt change of slope in the bottom, occasioning all 2956 the particles brought down through the rock-falls to be dropped in the sinuosities of the natural sluice.

Through the entire course of these obstructions, a channel-way of the prescribed dimensions was formed, and from an examination made last month, after the experience of the ice and freshets of the winter and spring ice, there are no decided signs of the filling in of the cut through the "gravel."

The working section, at Falls Branch, 4½ miles above Ingle's Falls, was next commenced upon. This work, lying on the convex side of a deep horseshoe bend, consists at head of falls of five rock ledges running across the river; vertical fall 3 feet 6 inches succeeded below by deep pool of still water, cut diagonally across as the river bends by longitudinal ledges, the lower section consisting of rock ledges, straight across, again terminated by an abrupt fall over a gravel-bed; fall in this lower section 4 feet to surface of pool extending up from "Ingle's"; width of low-water bed 900 feet narrowing to 670 feet in bend, and total length in river of the obstructions 1 mile. The rock here, a disintegrated slate, blasting but very badly, proved so troublesome, that but little progress was made, and on October 11, high water and cold weather setting in, work had to be abandoned for the season, and the property put in store at the railroad bridge.

The work of the season had been of a character before untried, and to a certain extent experimental, but what had been done having proven that the project adopted was fully capable of meeting the object held in view by it, with the exception of following invariably the natural sluices and channels, if the present work was to be utilized in the more general project proposed, the winter was devoted to preparing a complete outfit suitable in character for operating on a larger scale. The lack of "plant," transportation, tents, &c., had closely restricted the operations of 1877 by itself, even had there been no other reason to conduct the work tentatively, and a party of 50 was the maximum for advantageous working in the season of 1877. Plans were made for a special class of boats adapted to the work in hand, on which six boats were built, including a "crane-boat," with light machinery; and all preparations being complete by June 1, on 2957 June 14 the work of the season was begun, the delay being due to the unusual high stage of water in the river and constant violent rains. The completion of the "Falls Branch" section, the terminus of last fall, was taken in hand and is at date completed.

After the close of work on October 11, 1877, a small field-party made the necessary surveys for enlarged maps of localities worked at, which should show details and changes which the survey of 1872 did not exhibit.

On October 22, I made a series of gaugings of the river extending to October 30, the point selected being at and below Ingle's Falls, this point being chosen not so much with an eye to the regularity of river section, but because it was the most serious obstacle to navigation, on the line of the season, and was a characteristic type of that class of obstructions—the worst in the river—it was desired to ascertain, with as near a degree of approximation as the nature of the case would permit of, the amount of obstruction to steam navigation of the river.

The observations were made with tin ellipses, submerged to various depths, and wooden floats; and while numerous observations were made with all the care practicable, the nature of the stream itself and the particular locality rendered solutions within exact limits impossible. From the measurement and the formulas used, good approximate results were obtained, showing the mean velocity of the river at this point to be about 5¼ miles, and the discharge equal to about 900 cubic feet per second, with a gauge-reading of 7.75 inches. For a more complete solution a series of gaugings should be continued at various stages of the river, and a connection made with the more permanent gauge boards established in the lower New River, a mean distance of 100 miles below the site of this work, and referred to the Charleston (Kanawha) plane.

The above-given figures furnish all requisite information for immediate practical purposes; for more exact results, observations extending over some time and nicely conducted are required, so great and so sudden are the variations in the stages of this river, and so many anomalous features does its upper course of 128 miles present.

2958 The rocks passed through in excavating, consist mainly of the common limestones, often holding fine crystals of dog-tooth spar and slates.

At Ingle's Falls the rock was almost entirely a hard, tough gneiss. The limestones are often found partially disintegrated, and more often the slates, the latter, when lying in nearly horizontal beds, proving a very troublesome and costly bed to excavate, as involving quarrying after blasting, or blowing out in small fragments; the gravel in the river is large and may better be termed a "shingle." As a rule, the excavations have furnished about the necessary material for the dams, training-walls &c., in which no brush has as yet been worked, the inner constructions of this material, with stone by private parties, for special, local objects, and by the government of the States lately in rebellion, not having proved stable or satisfactory.

It is proposed in the further progress of the work, to use more extensively the gathering-dams and training-walls, as a means of securing the necessary depths, with a diminished amount of blasting; also to use, in certain cases, "giant-powder" as an explosive, and introduce the use of the churn-drill.

As a general description of this upper New River, it may be said to consist of a series of pools from 100 feet to 4 miles in length, with from 3 feet to 10 feet depth in them, some few points, "holes," showing 20, 30, and more feet. These pools are separated by ledges straight across or diagonal to the river, in groups of from 5 to 10. The total fall between pools rarely exceeds 7 feet, more often 3 feet or 4 feet, the actual vertical fall, not frequent, at a single ledge scarce ever being more than 18 inches; in fact, the so-called "falls" should be more appropriately termed "rapids."

There are some stretches of river showing long shoals, not bars, of the coarse gravel, but the pools and rock ledges predominate, pockets of gravel being generally found in and at foot of the "rapids." With such a regimen any improvement made as to deepening and widening the channel introduces the new obstacle of largely-increased velocity and volume; so that though the main and more important navigation of this river must ever be that of descending boats, yet no scheme of improvement can
2959 fully meet the requirements of the case without considering and aiming to counteract this induced obstacle to navigation.

Appended with be found tabular statements exhibiting figures of work, localities of same, and gauge-readings for the season of active operations of 1877–'78.

From the first table in will be seen that the work has been done at figures considerably below the estimates of the report of 1873, the general lowering of prices for labor and supplies of course largely affecting this, as also the favorable season for work shown by the gauge-tables.

With a gauge reading of +12 inches, which is the usual river's stage from November 1 to May 15, operations of the kind being carried on are impracticable.

As to the amount of work to be done for either the 30 feet or 90 feet width of channel-way, the experience of the year leads me to conclude that the estimates, as set forth in the report of 1873, are below considerably the actual amounts required.

Sketches of the more important working sections, Ingle's Falls and Falls Branch, are appended.

DETAILS OF WORK DONE. 1877–1878

Rock excavated and moved	cubic yards	724
Gravel excavated and moved	cubic yards	775
Number of holes drilled		1,044
Number of feet of holes drilled	feet	3,027
Average depth of holes	feet	2.9
Average depth of hole (2 inches) drilled per day per drill	feet	9.75
Number of blasts fired		984
Number of blasts missed		60
Number of cartridges made		1,076
Average charge of powder in each cartridge	pounds	5/8
Average loosening of rock per blast	yards	3/4
Average cost of pitch-bag cartridge completed		$0 19.5
Average cost of rock excavation, including blasting, scowing away debris, and building same into training-walls, &c	per yard	$3.50
Average cost of gravel for do	per yard	$0.70

REPORT OF THE CHIEF OF ENGINEERS, YEAR 1879

(pp. 79; 530–545)

11. Improvement of New River from the lead mines in Wythe County, Virginia, to the mouth of Greenbrier, West Virginia.—The work of the year has been in continuation of that of the preceding year and following the same plan, making a practicable channel-way for the keel-boats now running on the river, but keeping in view a more extended improvement for light-draught steamboats.

From July 1 to September 13, 1878, the work progressed well on the section of the river immediately above the bridge of the Virginia and Tennessee Railroad, the object being to bring that portion into close connection with a railway running east and west.

A very severe freshet in September, 1878, did so much damage that it was considered inexpedient to resume there, so nearly was the season closed.

For special reasons work was commenced in September, 1878, on the portion of the river immediately above the mouth of the Greenbrier River at Hinton, in West Virginia. This continued actively until near the end of November. Work was resumed on the same section as early in 1879 as the state of the river permitted, viz., early in June.

July 1, 1878, amount available	$23, 429.49
Amount appropriated by act approved March 3, 1879	12, 000.00

2962 F 11

IMPROVEMENT OF NEW RIVER FROM THE LEAD MINES IN WYTHE COUNTY, VIRGINIA, TO THE MOUTH OF GREENBRIER RIVER, WEST VIRGINIA

The plan adopted for this river has been the formation of a channelway 30 feet wide and 2 feet deep below the lowest water, suited for the keelboats now in use, but at the same time capable of utilization and adaptation at some future day, in a further improvement of the navigation for light steamboats, should means be provided therefor.

The ledges and detached bowlders have been blasted out under water, and the debris removed from the channel and built into the wing-dams and training-walls. The gravel shoals were excavated through and the materials placed in the hearts of the dams, &c. By these means sluices and chutes have been made, affording a good water-way, without insurmountably increasing the velocity and volume of the water in them. The work has been done altogether by hired labor, and the purchase of materials in open market.

Operations were confined to the section of the river above the crossing of the Virginia and Tennessee Railroad, under the personal supervision of Capt. J. W. Cuyler, Corps of Engineers, until September 13, 1878, when a very severe freshet occurred, causing a considerable loss of property, and doing some damage to the unfinished works. It was so late in the season that operations were not resumed on that section.

The appended report of Captain Cuyler gives a detailed description of them.

In August, 1878, it was decided to commence work at once on the section of the river immediately above the mouth of the Greenbrier, at Hinton, in West Virginia. These operations were placed under the immediate supervision of Assistant A. M. Scott, and vigorously continued until near the end of November. The report of Mr. Scott, appended hereto, gives the details of the work. This was resumed in June, 1879, under the direction of Col. W. P. Smith, assistant engineer. The working season is short, as the river must be low, the water clear and not too cold.

June 3, a small force was at work on Greenbrier Shoals.
2963 June 18, a force was engaged upon the Blue Stone Shoals, and June 17, on Land Craft Shoals.

It is found necessary to increase the estimate for the completion of the work by the sum of $56,160. The reasons for this are that the original estimate was approximate, being based on insufficient data, though the best then attainable; and actual experience has shown the quantities involved and the extent of the work to be done greater than previously supposed.

REPORTS OF CAPTAIN JAMES W. CUYLER, CORPS OF ENGINEERS

1

UNITED STATES ENGINEER OFFICE,
Baltimore, Md., July 3, 1879.

MAJOR: Pursuant to your instructions to this effect, I respectfully submit herewith the annual report of operations, improvement of Upper New River, Virginia, for fiscal year 1878–'79, in so far as these fell under my immediate charge.

For this report I adopt and submit, hereto attached, the report of operations for the season of 1878, after July 1, of date March 15, 1879. This latter report brings the record of operations up to October 15, 1878, when the operations under my immediate charge closed, and the entire work was transferred by your orders to a new locality, 84 miles down-stream.

The report of March 15, 1879, will be found to cover all the details of my operations, as also my general views on certain points, which may have a practical bearing in any further prosecution of the work, and which seemed clearly indicated to me
2964 by the experience of two seasons' work upon the river.

After October 15, 1878, I transferred to others, by your orders, the immediate charge of this particular work.

In this connection, I avail myself of the opportunity afforded me to express recognition of the valuable services rendered by my assistant in the office, Mr. William Costello, and by Messrs. Ranson and Gilliam, who acted as head overseers.

The plan adopted for this work was that of making a clear channel through all the obstructions in the river-bed, 2 feet deep below minimum low-water, 30 feet wide, for the now navigation of the stream—bateaux—to be later on enlarged to 3 feet depth and 90 feet width, for light steamboat navigation.

Original estimated cost of the work as now being carried on	$100,000
Whole amount appropriated since adoption of present project	42,000
(First appropriation, August 14, 1876; last appropriation, March 3, 1879.)	
Amount expended to date	25,697

The original estimate is insufficient to carry out to completion the existing project. The reasons for this excess of cost are, firstly, that when the original estimate was made the data on which it was based were in themselves not sufficiently full to admit of a close estimate; and, secondly, because in the light of the actual experience had, both the quantities involved and the extent of the words are greater than at first estimated for by a considerable amount.

I estimate as the probable additional sum required for completion, $56,160. This sum covers 128 miles of river to be improved under present project, at the rate of $1,220 per mile, which the actual figures of the two working seasons show to be a safe estimate per mile at the lowest.

Amount, exclusive of former appropriations, required for entire and permanent completion, $114,160.

While the nature of this work does allow of a permanent completion, this same nature involves an expenditure annually for maintenance and repairs; the probable sum of this, as nearly as can be estimated in this case, is $4,000.

Amount that can profitably be expended during fiscal year 1879–'80, $20,000.

2965 No revenue collected and no statistics to show amount of commerce or navigation that would be benefited by completion; the completion would, it is confidently believed, create a considerable amount of both.

No abstracts of proposals or abstracts of contracts, the work being done entirely by the United States, with all purchases in open market.

I have the honor, sir, to remain, very respectfully, your obedient servant,

JAS. W. CUYLER,
Captain of Engineers.

Maj. W. P. CRAIGHILL,
Corps of Engineers, U. S. C.

2

UNITED STATES ENGINEER OFFICE,
Baltimore, Md., March 15, 1879.

MAJOR: I have respectfully to submit the following report of operations on the Upper New River, Virginia, for the season of 1878, the period of time so covered extending from July 1, 1878, to which date my annual report of operations for 1877–'78 brought up the record to October 15, 1878, when all operations whatsoever were brought to a close.

After July 1, the work of completing the then working section, Falls Branch, by completing its two upper subsections, Bucks Falls and Egypt Falls, was continued, as previous to that date. The monthly reports set forth fully the difficulties and disappointments attending this work, all delaying the completion of it till August 20, far beyond the estimated date for completion. The length in river of this Falls Branch working section aggregated 1 mile, over which almost continuously work of some kind was done. Next, minor obstructions at Egypt Ford, 1/4 mile farther up stream, and at Woolwine's Island, 1 mile beyond latter, were removed, and the work completed hereat (for localities, vide survey map of 1872). August 21, also, was begun the work at the Peak Creek section, 4 1/2 miles above the Falls Branch one. For a detailed description of this new section and the special difficulties 2966 of its work, I respectfully refer to the monthly reports.

The position required a large amount of work of a preparatory nature; indeed, this was the main amount, and it was accomplished; no large amount of work in addition was required to complete the section, with a channel 30 feet wide in the lower subsection of 2,900 feet of river length, and 20 feet wide in the upper of 3,600 feet, a total length of river of 6,500 feet covered by the obstructions. On the 13th of September, while the above work was not entirely completed as above indicated, a freshet unprecedented—27 feet high at Peak Creek—unexpectedly and abruptly terminated the season's operations, by washing away and destroying the camp with its plant for the work, and greatly endangering the lives of all the working force. Though this flood ran out rapidly, the river until December, when winter froze it tight, kept much too high for any operations. After the flood, examinations were made at all the several working sections to determine the effects of the flood upon the works, the results of which have been submitted to you in a special report. The detail maps of the season's operations completed in the office, the property collected together and put in repair, and, finally, all boated down to Hinton, W. Va., at mouth of Greenbrier River, a distance of 84 miles, to which point, under your decision, operations were to be transferred in future as a base. Everything was closed up by October 15.

Appended are detailed exhibits expressed in figures; these show results satisfactory and gratifying in the improvement made over the corresponding figures of the season of 1877, due to a larger force, better organization, and adequate preparations, made in advance of beginning work, both as to the aggregates of work done and the several details of the same, the same general plan of operations being continued in both years. In no case did the preparations made the previous winter fail to meet their designed purpose.

The two bateaux built by informal contract drew but 5 inches of water, light, and with 3 tons load but 15 inches, answering entirely to the requirements of moving the force, stores, &c., from camp to camp, as also for reconnaissances, examinations, 2967 &c.; the craneboat, though she could not be used as much as was expected, owing to the obstructed channels rendering it impossible often to get her into position, lifted 2½ tons on a draught of 6 inches of water, with her legs or spuds down. This device did admirably, a slight change, only practice pointed out, was needed in decreasing the outward spread from sides of boat of these spuds. The stone and gravel boats, drawing 6½ inches light carried from 3 to 5 tons at a load on 16 inches of water, and, notwithstanding their weight, due to their solid construction, and the inevitable difficulty of handling such a style of boat in such a river as this, yet proved their efficiency, and went through a very trying (on them) season without any repairs being put on them; to make the plant on this line as perfect as it is possible to make it, they but require to be supplemented by a fleet of smaller boats—large strong canoes built with knees—carrying from ¾ to 1¾ tons on 12 inches of water, for use in the worst places.

The use of the churn-drill was introduced, but successfully only exceptionally; it was too unwieldy for one man to manipulate in such water, and experience confirmed that the jumper, with the 2-inch-diameter holes (for powder), first started with, was the best and cheapest system of drilling. Deeper holes, 3.75 feet (average) against 2.9 feet in 1877, were used, as it was found absolutely necessary to go below the grade of bottom as laid out, so as to get at completion the required depth; thus with an average charge (of powder), less than in 1877, 0.54 pound and 0.65 pound, more rock was moved per blast, 1 yard (cubic) against ¾ yard. Though considerably more labor was thus involved, yet the work per drill per day (average) increased from 9.75 feet, 1877, to 12.78 feet, 1878. Giant powder No. 2 was also introduced, and with such successful results as to indicate the advantage of using it almost exclusively in future work, provided proper arrangements be made, in Baltimore, in advance, to supply it regularly in small

quantities at a time. With this, 1¼-inch-diameter holes were used as ample. and only ⅓ pound cartridges (average); by it so used the rock was so riven along the seams that it could be easily hoisted out in large blocks by the craneboat; larger holes or
2968 cartridges were disadvantageous as pulverizing the rock too much; of course, with this explosive, good judgment in its use is indispensable to produce good results; not unfrequently, however, in this work, if the rock is without seams or planes of stratification, the ordinary blasting-powder will do the desired work.

With the satisfactory results above noted accomplished, it may be further added that these were accomplished in the face of an unfavorable season for river work; it did not fairly open till the last part of June, and after July 1 comprised but 57 days on work proper, against 60 such days in 1877, beginning then July 23 and closing October 11. The appended plotted gauge-readings show, too, that the river in 1878 did not fall below—6½ inches on gauge, and the average stage for the season was not less than—3 inches, with three distinctly marked high freshets, entirely suspending operations for their continuance of 2 or 3 days, while in 1877 the stage was as low as—13 inches, with an average of—8½ inches, and but one freshet of note. The bearing on the work of this stage for 1878, higher by 6 inches all through, and about 4 inches above the ordinary summer low-water stage, is best appreciated in considering that with a gauge-reading of +10 inches, work is very difficult; and with +18 inches absolutely impracticable, so that but small limits as to stage of river are afforded for advantageous working.

A study of the readings on the gauge-pegs established at each camp, as the work progressed up stream, but all carefully connected with and referred to the initial peg near railroad bridge, shows some anomalous features, due, it is believed, to special local conditions predominating at each locality; on no gauge did synchronous readings give corresponding levels for the water surface, the differences being as small as ⅜ inch and as large as 5½ inches, and apparently not governed by any period or other continuous and distinct law or ratio, but subject to unaccountable fluctuations; these suggest the difficulty of maintaining the same continuous grade for the bottom, when, in the progress of the improvement, long stretches of river came under treatment.

2969 To summarize: 13½ miles of river have been improved, at a round cost of $1,220 per mile; the last work—at Peak Creek Shoals—being at the obstruction which more effectually than any other, in the whole line of 19 miles up from initial point—railroad bridge—originally projected for improvement, estopped navigation in the low-water stages; the map shows this, the natural channel running for ¾ of a mile over a gravel slope underlaid by flat rock no lower than 1 foot, with the river over 400 yards wide, and most of its water in the deep pools barred by ledges on the other (easterly) bank. As was to be expected, 4 to 6 inches of water was often alone available, and no loads at all could get over; add to this a fall of 13.479 feet in the 6,661 feet of obstructions in bed (the survey of 1872 gave 14.80 feet fall, but the new leveling is believed to be the correct one), and the difficulty and importance of the section demonstrate themselves.

The freshet of September 1878, undoubtedly went to impair much the improvement made, involving an expenditure of from $2,000 to $3,600 to do over work once completed; but with this, even, there has been a decided betterment of navigation effected. The fact, however, originally set forth must not be lost sight of—that if any marked benefit is to accrue from the improvement it must be extended up 5 miles—to make the 19 miles first projected—or to Mac's Creek, at a cost of $7,600 more. This point is in this region the down-stream boundary of an extensive and rich mineral-producing district, which is the main interest to be served by the improvement, and which alone can and would inaugurate fully use of it when once made. To utilize, then, the work already done commensurately with its cost, necessitates as immediate a completion to Mac's Creek as possible.

A review of two seasons' operations establishes certain general points, which seem to call for consideration here. The practicability of the original project has been fully proven, with the modification of abandoning the idea of selecting the present natural sluices to patch up, not only for the contemplated steam-navigation, but even for the bateau navigation and rafting.
2970 It is necessary, in my opinion, to adopt a more general and radical method to effect a permanent improvement than has heretofore been tried. With this in view, I recommend a free use of dams to collect into pools the water, which constructions should be much more elaborate than any heretofore attempted. Further application of the approved formula convinces me that 900 cubic feet per second is the maximum discharge of the river to be calculated upon in the yearly low stages. Generally, as low as 700 feet only will pass. The worst places invariably are where this constant volume discharges through a section enlarged by widening of the low-water bed. The mere rock ledges, per se, form a minor type of obstructions, as always they have above and below them pools more or less deep, and blasting through them readily gives a good sluice with regular grade. The velocity is certainly hereby injuriously affected; but low regulating dams or long training walls below always can be put in to better dis-

tribute, and thus rectify this induced obstacle to navigation. With the shoals and rapids the case is different. Here the simple go-ahead work of blasting down to a depth and clearing out obstructions is ineffective, as by as much nearly as the bottom is so lowered does the surface fall shortly afterwards. The supply of water must, firstly, be augmented by going up to the very head of the obstruction, probably 1, 2, or 3 miles up, and constructing the water-way by building out bodily from the banks low but solid dams, followed down stream by guide-walls. In such structures I should use largely brush in mats or bundles; for while the river does not carry in it much sediment, and the dams would generally find rock to rest on, yet it would allow of broad bases, and would make thus not only a cheaper but a more water-tight dam than rock alone.

I should project for future work more construction of this kind, much less blasting.

The new system, more like to a slack-water system, would probably entail a cost beyond that of the original estimate for this improvement, by reason of the greater quantities of work involved. The work, however, can be, and has been done, done at figures below that estimate. The proposed system would be un- 2971 questionably slow of execution, too slow for those requirements other than the engineering ones; the main dams, all requiring correct location, would necessitate a study of and acquaintance with the river throughout the year—a residence on it, by the engineer in immediate charge. In this country, where to move from point to point, to transport supplies, &c., is slow work at best, it is impossible for the engineer to properly manage works spread over any considerable stretches, and yet in any extended operations, to attain the desired execution, such spreading out is necessary, as 100 men to a locality and camp are about the advantageous working maximum. On this basis, working on the present plan, not more than $18,000 can be expended in one season, so short are these. Every preparation must be completed before work actually begins, as also the essential duty of examining and locating by permanent marks the works proposed for that season; this would require the maintenance of a small permanent party making surveys, maps, &c., and a large quantum of labor and exposure for the engineer.

For the river from Hinton up to Sifford, 64 miles, the open-river system of improvement will, I think, be found to be but partially applicable; the dimensions of the river and of the main falls will necessitate the construction, at these latter, of locks and dams; with the open sluices, some system of towing up ascending boats, by cables on the bottom, the motor being steam or air, located on the banks, or better, on large floats fixed in the

still upper pools, will, in my judgment, be found essential. The main feature of the present plan, that of low constructions, should in all cases be held in practice, as far as practicable. Experience, as developed by the universal fate of the work of the late Confederate States on this river (though this now seems to have been injudiciously located and poorly built), is adverse to anything like rigid structures, such as large timbers bolted down to the bed-rock, interfering with the free discharge of the waters, in the sudden and great freshets incident to this river, and which, as the country towards its headwaters becomes stripped of its forests and gradually opened to cultivation, must be looked
2972 for more frequently and of greater size, with periods of years to elapse.

That the proposed improvement will be of real and decided local benefit, I consider now proven. It, and it alone, can and will afford an adequate outlet for a region good agriculturally; and with ascertained workable mines of the ores of lead, zinc, coal, and iron, and a considerable lumbering district all favoring the building up of local manufacturing interests, an outlet alone is needed to put in motion at once a considerable and increasing trade. Statistics on these heads, in the present condition of things, it is impossible to give, as not existing. I have the honor, sir, to remain, in conclusion,

Very respectfully, &c.,

JAS. W. CUYLER,
Captain of Engineers.

Maj. W. P. CRAIGHILL,
Corps of Engineers, U. S. A.

TABULAR STATEMENT OF WORK DONE

Average force worked during season, men	number	102
Working days in season, on work, men	do	57
Rock excavated, moved (by boats), and built into constructions, or wasted, cubic yards		1,940
Gravel excavated, moved (by boats), and built into constructions, or wasted, cubic yards		1,092
Cost of rock work, as above specified	per cubic yard	$2.20
Lead, in boats, from 50 yards to 200 yards.		
Cost of gravel work, as ditto		$0.61
Amount of constructions	linear feet	2,325
Average base, 11 feet; height, 433 feet; slopes, 1½ B to 1 P, and 1 B to 1 P.		
Holes drilled	linear feet	8,734
Average depths of holes	do	3.75
Average depth of holes drilled per day, per drill, 10 hours	do	12.78
Blasts fired	number	2,219
Misfires	do	51
Holes abandoned	do	226
Ratio of misfires to blasts	per cent	2⅛
Average charge powder, per cartridge	pounds	0.54
Average charge dynamite	do	0.33

Average rock moved per blast	cubic yards	1
Cost complete of pitch-bag cartridge (cartridge 15 inches long over all, 13 inches of powder, 1 quart tar to 2 gallons pitch-mixture; diameter, outer, 1¾ inches, full)		$0.175
Explosives used, powder	pounds	1,275
Explosives used, dynamite	do	235
Fuse used	linear feet	13,182
Fuse length, average per cartridge—4 minutes' time	do	5.8
Cost of commissary department per day, per man	cents	17⅛

Ration per day: 1 pound pork, 2¼ pounds cornmeal, 1.08 pounds sugar, 5 pound coffee, vegetables.

2973 REPORT OF MR. A. M. SCOTT, ASSISTANT ENGINEER

UNITED STATES ENGINEER OFFICE,
Charleston, Kanawha County, West Virginia, May 26, 1879.

COLONEL: The following report on the improvement of New River, immediately above Hinton (mouth of the Greenbrier), from the beginning of operations in September last to date, is respectfully submitted.

In compliance with your instructions, dated Hinton, August 23, 1878, received through Lieutenant Turtle, I went at once to that place to estimate and arrange for starting the work. Your instructions were, in effect, to plan to do the least possible at any one point compatible with the navigation of the steamer then building at Hinton by the New River Steamboat Company, so that as much of the river as possible might be gone over during the low-water season.

I found, by conferring with the directors of the company, that they were anxious to have improvements made as soon as possible that would enable them to run their boat up to the mouth of Lick Creek, about 22 miles above Hinton. This would open to navigation considerable fine farming country, and practically connect with the important Tazewell County road. As the small appropriation could not possibly be applied to advantage over a greater distance, I limited my investigations to that point, and it was finally thought best, owing to the lateness of the season and the need of economy in applying the money, not to attempt anything last fall above the foot of Bull's Falls, and a project and estimate for opening a preliminary channel up to that place (11 miles above Hinton) were submitted as soon as possible, and approved by you in letter dated September 5.

As to a description of New River above the mouth of the Greenbrier, the susceptibility to improvement for steam navigation, the characteristics of the beautiful and promising country through which it runs, I can add nothing to your quite full reports of December 1872 and January 1873, printed as Appendix T 29, of the Chief of Engineer's Report for 1873.

The work, as planned and partly carried out last season, consisted principally of blasting a channel 50 feet wide and about 2 feet deep at low-water, through the solid ledges of which 2974 the shoals are mainly composed. There were also many large detached pieces and bowlders to be removed either by a crane-boat or blasting, or both, and more or less smaller stone and gravel, best managed by hand.

The following is an abstract of the project and estimate approved by your letter of September 5:

For a craneboat	$600.00
For 1 batteau	75.00
For 3 skiffs	75.00
For tools and blasting material	450.00
For labor, including foremen, to be expended in blasting and removing by hand solid rock and loose stone at the different shoals, viz:	
Between the landing at Hinton and head of Greenbrier Shoals (mostly solid rock)	1,375.00
Pack's Ferry Shoals (bowlders)	85.00
Deer Lick and Blue Stone Shoals (bowlders and solid-rock)	530.00
Land Crafts Ford and Shoal (solid rock)	900.00
Buffalo Shoal (bowlders and solid rock)	165.00
Gardner's Ledges (solid rock)	490.00
Ellis Shoal (bowlder and solid rock)	245.00
To operate craneboat 35 days, with a force of 11 men, including foremen, at $18 per day	630.00
For blacksmithing	125.00
For superintendence and contingencies	800.00
Amount of estimate	6,545.00

Arrangements for beginning work, the procuring of tools, boats, blasting materials, &c., were made at once, and a force of hands got to work on the shoals between the landing and the foot of Greenbrier Shoal on September 7.

Operations were a good deal delayed by the unprecedented rise in the river, which on September 13 reached 20.20 feet above low-water at Hinton. At the mouth of Blue Stone River, 5 miles above, its highest point was 23.7 feet above low-water. This was from 5 to 6 feet higher than ever known before. It did much damage in the valley. At Upper or Old Hinton 16 buildings, several of them good frame houses, were carried away. The sawmill of Mills and Company, the only one then in operation in the place, was also seriously damaged.

The damage to the mill delayed us considerably about the building of the craneboat, and we did not succeed in getting it ready for work till October 12. The boat, as built, overran the estimate, costing, complete, $730. It is 48 by 17 feet, rigged with a good double-geared crab, capstan, spuds, and a strong four-2975 pronged grapple of 5 feet reach. It proved to be well adapted to the work. Both it and the smaller crane sent down from the upper river did good service, and will be indispensable in future operations.

The boats, tools, camp equipage, &c., that had been in use by Captain Cuyler on the upper part of the river were received at Hinton October 13. As stated, the most of the work consisted in blasting. This was all under water, generally in a current so swift that breakwater-dams were necessary and could only be carried on to advantage in low, clear stages. The season was very unfavorable; besides the big flood of September, the work was frequently stopped by small rises and bad storms. Owing principally to so much of the work being in the water a good deal of trouble was had in getting hands, particularly after the weather turned cool, and we were finally obliged to send a number from Kanawha to keep up the force. From 40 to 75 men, distributed at different points, were kept employed whenever the weather and water would permit, till November 27, when we were obliged to suspend for the season. Nothing has been done in the river since, except to place three additional ring-bolts and remove a few particularly troublesome stones at Greenbrier Shoals.

The work was carried out substantially as planned, but at a greater proportional cost, up to the head of Blue Stone, and a considerable amount was done on Land Crafts, the next shoal above. We were unable to do anything above that point.

The following is a statement of the rock removed at the different shoals measured in piles, side walls, &c., after excavation:

	Cubic-yards
Between Hinton Landing and foot of Greenbrier Shoal (estimated)	43
On Greenbrier Shoals	1, 754
On Pack's Ferry Shoal (estimated)	12
On Deer Lick Shoal	227
On Blue Stone Shoal	221
On Land Crafts Shoal	437
Total	2, 694

As appears, the greater part of the work was done on Greenbrier Shoals. This is a bad place, consisting of a series of solid ledges, beginning at the mouth of Greenbrier River and extending up 3,600 feet. The fall in this distance, Hinton gauge reading 3.30 feet per levels by Mr. Schoonmaker, was 7.20 feet.

2976 The work on this shoal exceeded my estimate a good deal, and there is still considerable work to be done on some of the ledges at straightening and widening the channel. The average cost not including outfit, boats, tools, &c., of all the excavation, measured in the pile, was a little over $2 per cubic yard. On Greenbrier Shoal, where the work was heavier and more connected, the cost was about $1.40 per yard.

Dynamite or giant powder was used almost exclusively, with very satisfactory results. It proved to be much better for the work than common powder.

The width of channel adopted, 50 feet, has been found by trial to be too narrow in places for the new steamer, and it will be necessary to increase it to about 75 feet at some points where the current is very swift or somewhat indirect. As a rule, though, it is thought 50 feet will answer present purposes.

As to slopes, depths, &c., but little was attempted at grading the chutes; and at several places it was found impracticable, under the plan pursued, to reduce the slope to less than about 1 in 130, and on a few of the ledges and falls it will be even steeper than this. With such grades, a depth of not more than about 2 feet (equal to an available low-water depth of about 18 inches) could be made; and this was finally adopted and worked for throughout.

By extending the side-walls somewhat, and the occasional use of short wing-dams (the rock excavated for channels was used for these purposes as far as it went), it is thought an available ordinary low-water depth, of from 20 to 22 inches, can be made at very reasonable expense.

Steamers will be obliged to "wind" through some of the chutes, and must be provided with steam capstans for this purpose. To facilitate the ascent of boats, the channel at the shoals was located next the shore as far as practicable; and at other points, where the current was too strong to be stemmed, ring-bolts were placed.

The steamboat company got their new boat, the Cecilia Miller,
ready to run by the middle of December, and have since made
several trips, during rather high stages of water, to the
2977 foot of Bull's-Falls. They are unable though, when the
Hinton gauge reads less than 3½ feet (corresponding to
2.60 feet above low water), to get above Land Crafts, the point
reached by our work last fall.

The boat is a well built stern-wheeler, 100 by 20 feet, provided with a steam boiler, 8 by 30 inch cylinders, a steam capstan, and good machinery throughout. She draws, when light and under way, less than 12 inches. She is thought to be rather too large for the navigation intended, but is considered as having fully demonstrated the practicability of making this part of the river navigable for small light-draft steamers.

The benefit afforded to the lumbering interest, which is considerable and increasing, should also be noticed. Many of the old batteau channels and "notches" are so narrow and crooked that rafting is attended with a good deal of risk; our channels being wide enough for the rafts, will render the passage of the shoals comparatively safe.

The desirability of continuing the improvement up to the mouth of Lick Creek as soon as possible, has been referred to.

This, as stated, would benefit quite an extent of good farming country, notably the rich Crump's Bottom and Indian Creek districts, and connect with the Tazewell, Mercer, and Monroe County wagon-road. Between Land Crafts and the mouth of Lick, the principal points to be improved, mentioned in order going up, are Gardner's Ledges, Bull's Falls, War Ford Shoal, Crump's Ledges, and McDaniel's Falls. War Ford, which has a fall of about 8 feet in 1,000, is the most serious. It is thought a permanent winding-line or wire-rope will be advisable at this shoal, and some arrangement of this kind is likely to be found expedient at other points.

The additional expenditure necessary to complete the improvement, as begun, to the mouth of Lick Creek, I have estimated roughly at from $18,000 to $24,000.

My duties on the Kanawha Improvement made it necessary for you to employ a local superintendent, and I take pleasure in acknowledging the efficient services of Mr. T. Schoonmaker, assistant engineer, who acted in this capacity during the working season. From notes and sketches made by Mr. 2978 Schoonmaker, maps (five in number) of the shoals where work was done were made on a scale of 1 inch to 100 feet.

During the progress of the work, temporary gauges, referred to approximate low-water, were kept at various points on the shoals; these were finally connected with permanent bench-marks.

Agreeably with your instructions, and by permission of Lieutenant Turtle, I went to Hinton on the 19th instant and turned the records, property, and work generally, over to Col. William Proctor Smith, assistant engineer.

Very respectively, your obedient servant,

A. M. SCOTT,
Assistant Engineer.

Maj. WM. P. CRAIGHILL,
Corps of Engineers, U. S. A.

SURVEY OF NEW RIVER, FROM LEAD MINES, IN WYTHE COUNTY, TO THE MOUTH OF WILSON CREEK, IN GRAYSON COUNTY, VIRGINIA

UNITED STATES ENGINEER OFFICE,
Baltimore, Md., January 10, 1879.

GENERAL: In the river and harbor bill of June 18, 1878, was a requirement for an examination or survey of New River, Virginia, from the Lead Mines, in Wythe County, to the mouth of Wilson Creek, in Grayson County. A survey had been previously made (in 1872) of the portion of the river from the Lead Mines down to the mouth of the Greenbrier, at Hinton in West Virginia, and in 1874, in connection with the surveys of the central water-line, a survey had been made of the part of the river from Hinton to the mouth of the Gauley, where the New and Gauley unite and form the Great Kanawha. The whole of the river, therefore, from the mouth of Wilson Creek to its mouth has been surveyed and mapped.

The New River rises in North Carolina and crosses the line between that State and Virginia nearly at the mouth of Wilson Creek, the initial point of the survey of 1878. After flowing in a general easterly direction from the mouth of Wilson Creek, it
turns down again into Alleghany County, of North Caro-
2979 lina, whence it soon re-crosses into Virginia. The point of
its junction with the Gauley, in West Virginia, is almost due north of the place of its crossing from North Carolina into Virginia.

The survey of this year was made in September by Col. W. Proctor Smith, lately of the Corps of United States Topographical Engineers. His report, dated January 10, 1879, and maps, prepared in this office, are forwarded; the report by mail, and the maps by express.

The portion of the river surveyed by him has a length of 62 miles. The survey was as complete as the money available allowed. Colonel Smith's report is quite full, and, together with the maps, gives much valuable information concerning the river, and the country through which it passes.

It appears, from a study of the regimen of the river, that there is an "abundance of water for any system of navigation that may be inaugurated."

Three estimates are presented for the improvements, as follows:

1. For a two-foot navigation for keelboats, with a channel not less than 30 feet wide, with tracking or towing paths at the falls and rapids	$115,000
2. For a steamboat navigation, with a channel 90 feet wide and not less than 3 feet deep, with a grade always less than 1 in 400, including 28 locks and dams	1,200,000
3. For a five-foot steam navigation	1,600,000

Very respectfully, your obedient servant,

Wm. P. Craighill,
Major of Engineers.

Brig. Gen. A. A. Humphreys,
Chief of Engineers, U. S. A.

Report of Col. Wm. Proctor Smith, Assistant Engineer

Baltimore, *January 10, 1879.*

Colonel: I have the honor to submit the following report of a survey of New River, made last fall, under your directions, and with it the following maps, viz: Seven sheets of map of New

River, scale 1 inch to 800 feet; one tracing of map of New River, scale 1 inch to 5 miles; eleven sheets of profile of New River, scale 1 inch to 400 feet; one sheet of profile of New River, scale 1 inch to 4,000 feet.

2980 The first maps exhibit the meanderings of the stream, its width and depth, as well as position of ledges, shoals, and falls, also topography. The second gives the outlines of the stream, on a smaller and more convenient scale. The third indicate the slope of the water surface, from the mouth of Wilson to the Lead Mines, on an exaggerated scale. The fourth, the same slope on one sheet, for greater convenience.

The maps are of such a scale, and the whole report written in such a manner, as to make the survey an extension of the one made, under your directions, by N. H. Hutton, in 1872, from the Lead Mines to the mouth of the Greenbrier.

Only so much of the river was surveyed as lies between the mouth of Wilson, in Grayson County, Virginia, and the Union Lead Mines, in Wythe County, Virginia, a distance by the course of the river of 62 miles.

An examination of this section was made, in 1874, by S. T. Abert, United States civil engineer, who described the country and river and reported thoroughly on its mineral and agricultural resources to the Chief of Engineers of the United States Army, January 7, 1875.

The party was organized and equipped on the 26th of August, at Wytheville, the county-seat of Wythe County, Virginia, 47 miles from the mouth of Wilson via Independence, the county-seat of Grayson County, Virginia. On the 28th of August it was in camp at Fox Creek, a few miles from the mouth of Wilson, ready for work, but owing to a rise in the river of 8 feet, operations were not commenced until the 2d of September, and finished October 1, at the Lead Mines.

Level and transit lines were run throughout the entire distance, determining the meanderings of the river, the slope of the water-surface, and the form and character of the obstructions. Numerous soundings were made, and sufficient topography taken for the purposes of the survey.

September the 12th, at the 18th mile, a sudden and unprecedented rise of the river took place; 18½ feet above ordinary low-water, and 7½ feet higher than the great flood of May 1840. At Samuel Cox's mill, below Peachbottom Creek, the rise was 22 feet.

2981 New River is formed by two tributary streams, which rise in the mountains of North Carolina and unite on the border of Virginia. The North Fork rises in Ashe County, the South Fork in Watauga County, and they flow together

4 miles above the mouth of Wilson, the initial point of this survey. From the latter point the river runs between the different ranges of the Blue Ridge and the Alleghany Mountains, in an easterly direction for 22 miles, and thence northeasterly to the terminus of the survey. The headwaters are 2,500 feet above tide-water; the country mountainous, the roads rough and sometimes impassable.

Throughout this distance, except where the river flows through the mountains, the valleys present some bottom-lands in places from one-half to three-quarters of a mile wide. The hills bordering on the river, however, are cultivated to their very summits.

Beginning of the mouth of Wilson, with a width of 300 feet and an average depth in the pools of 4 feet, the river gradually widens to 1,000 and 1,100 feet, and contracts again to the width of 450 feet, and an average depth in the pools of 5 feet at the Lead Mines.

Between the mouth of Wilson and the Lead Mines, several streams of no inconsiderable size empty into New River; among them, from the south and east, are Potato, Carolina-Elk, Meadow, Chestnut, and Crooked Creeks, and Little River; from the north and west, Fox, Saddle, Bridle, Peachbottom, Elk, Eaglebottom, Surgener, Brush, Snowhill, and Cripple Creeks, and Bull Run. All of these are mountain streams, furnishing from 25 to 200 cubic feet of water per second, at ordinary stages.

The drainage area of the river, within the limits of the survey, amounts to 900 square miles.

The river during a portion of the time of this survey was down to what the inhabitants call summer water, but they had known it 3 or 4 inches lower. The stream, however, was sufficiently low for the results of observation for velocity and quantity of water to be relied upon. The discharge indicated 2 miles below the mouth of Wilson was 1,200 cubic feet per second; and 1,800 cubic feet per second at a point 4 miles above the Lead Mines. These results show that the stream affords abundance of water for any system of navigation that may be inaugurated.

2982 As is usual with mountain streams, this river presents pools of comparatively deep and still water, separated by rapids, shoals, and falls. The water flows in the pools at about the rate of 1 mile per hour; over the rapids at about the rate of 3 miles per hour, and over the falls at about the rate of 5 miles per hour. The depth usually, over the falls, is from 9 to 12 inches; frequently, however, obstructions are formed below, by bowlders, which increase this depth to 2 feet.

Throughout this survey the pools are very short, whole miles being composed of ledges of gray and blue granite or slate, a few hundred feet apart, with very short pools between. Only five pools of a mile in length in this portion of the river.

The total fall in the river from the mouth of Wilson to the Lead Mines is 507 feet, or about 8⅙ feet per mile; a grade, although very heavy, that, if distributed equally throughout the entire distance, would not present an insuperable obstacle to the navigation of the stream.

The obstructions to navigation consist of solid flat rock on the bottom of the river, loose rock, gravel, and sand; ledges over which the water flows, those which scarcely disturb the surface, and collections of bowlders, showing many feet above the surface. The ledges encountered for the first 20 miles of this survey are composed of gray granite almost entirely; for the next 30 miles this same rock, called by the inhabitants gray river rock, largely predominates, interspersed with blue granite or slate, soap and sandstone, and some gneiss and ferruginous rock; for the last 5 miles the ledges are almost exclusively limestone. In a great many instances these deposits are distorted and upheaved in such a manner as to make their removal easy by blasting.

The following statement of the obstructions met with in each mile will give a good idea of the work necessary for the improvement of the river. The stream elsewhere than where these obstructions prevail affords a good navigation of 4 feet at low stages.

Commencing at the mouth of the Wilson, with an elevation above tidewater of 2450.9 feet, four shoals, over gray granite ledges, are to be found in the—

2983 First mile.—One at ford, 300 feet long, fall 3 feet; one 100 feet long, no fall; one 800 feet long, loose rock, fall 1.8 feet; and one 300 feet long at ford, fall 1.1 feet. Fall in the mile 7.74 feet.

Second mile.—Elevation 2443.16 feet, one shoal 100 feet long, no fall; slight rapids, flat rock bottom for 2,450 feet, fall 3.6 feet. Fall in the mile, 6.47 feet.

Third mile.—Elevation 2436.69 feet; Fox Falls, 2.55 feet in 150 feet, over 2 ledges of solid rock; one fall .6 foot in 75 feet; and rocky shoal 400 feet long, fall 1 foot. Fall per mile 5.76 feet.

Fourth mile.—Elevation 2430.93 feet; one slight shoal 2000 feet long; fall 1.4 feet. Fall in the mile 3½ feet.

Fifth mile.—Elevation 2427.3 feet; one shoal full of bowlders, 1550 feet long, 2.2 feet fall; one shoal 300 feet long, no fall; one fall .7 foot in 100 feet. Total fall 4.53 feet.

Sixth mile.—Elevation 2422.90 feet; one shoal 2000 feet long, bowlders at Cedar Island, flat-rock bottom, fall 6.88 feet; one shoal 300 feet long, fall 1.2 feet. Total fall 10.57 feet.

Seventh mile.—Elevation 2412.33 feet; one shoal 250 feet long, full of bowlders, fall .4 foot; slightly shoal for 2600 feet, bowlders, fall 3.9 feet. Total 6.91 feet.

Eighth mile.—Elevation 2405.42 feet; good water; one ledge, 1 foot high, extends ¾ way across the stream. Fall in the mile 2.83 feet.

Ninth mile.—Elevation 2402.59 feet; fall of 1 foot in 50 feet, good soundings over it, and there smooth water; one shoal 300 feet long, no fall. Total fall 2.83 feet.

Tenth mile.—Elevation 2399.76 feet; Osborne's Falls consisting of a succession of ledges, from 6 inches to 18 inches, over which the water falls nearly vertical; 1st fall 8 feet in 1200 feet, then pool 1100 feet long; 2d fall, 7½ feet in 600 feet, then rapids, with deep water, but full of bowlders, fall 1½ feet; 3d fall, 3¼ feet in 200 feet. Fall in the mile 20¾ feet.

Eleventh mile.—Elevation 2379.01 feet; good water for
2984 600 feet; balance wide and shoal; shoal between island and
mainland; gravel and loose rock. Total fall 7.36 feet.

Twelfth mile.—Elevation 2371.65 feet; one ledge 50 feet long; fall ½ foot; one shoal 500 feet long, full of bowlders; 2 ledges; fall 2 feet; shallow between island and mainland; one fall .8 foot in 50 feet; one shoal 800 feet long, full of bowlders, at Elk Creek Ford; fall 3½ feet. Fall in the mile 9.44 feet.

Thirteenth mile.—Elevation 2362.62 feet; bowlders at island; one 500-foot shoal at Horse Ford, flint rock and flat bottom; .6 foot fall; fall of 2½ feet in 250 feet; one shoal 450 long; fall .4 foot. Total fall per mile, 7.84 feet.

Fourteenth mile.—Elevation 2354.37 feet; one shoal 500 feet long; fall .6 foot; one slight shoal 800 feet long; fall 3 feet; one shoal 400 feet long; fall 1 foot. Fall per mile 6.8 feet.

Fifteenth mile.—Elevation 2347.57 feet; slight shoal 1700 feet long; fall 3 feet; river broad, shoal and rapids for 1450 feet; 3 feet fall. Fall per mile 7.41 feet.

Sixteenth mile.—Elevation 2340.16 feet; rapids and fall at beginning over blue granite or slate; fall 3 feet, balance good water, gravel bottom, some sand islands. Total fall per mile 5.68 feet.

Seventeenth mile.—Elevation 2334.48 feet; commences with good water; then shoal 1600 feet long at Doughton's and Middle Ford. Total fall 4.38 foot.

Eighteenth mile.—Elevation 2330.10 feet; at beginning shoal for 400 feet, at Taliaferro's Ford; fall 1 foot; then pool, and at end shoal 750 feet long; fall 3.3 feet. Fall per mile, 7.03 feet.

Nineteenth mile.—Elevation 2323.07 feet; good navigation. Fall per mile 2.71 feet.

Twentieth mile.—Elevation 2320.36 feet; good water. Fall per mile 6.82 feet.

Twenty-first mile.—Elevation 2313.54 feet; one shoal 1700
2985 feet long; fall 4 feet; one shoal 1600 feet long; fall 3 feet
Fall per mile 7.55 per feet.

Twenty-second mile.—Elevation 2305.99 feet; rapids for 300 feet; 1.3 feet fall; 2 slight shoals, 400 feet long each; balance pool. Fall per mile 5.79 feet.

Twenty-third mile.—Elevation 2300.20 feet; shoal 175 feet long; fall 2 feet; at Peachbottom Creek and Cox's Ford, slightly shoal for 2400 feet, water smooth and still. Fall per mile 4.94 feet.

Twenty-fourth mile.—Elevation 2295.26 feet; ~~rapids for~~ 250 feet, good water, however; balance pool. Total fall 6.2 feet.

Twenty-fifth mile.—Elevation 2289.6 feet; rapids for 100 feet; falls .4 foot; rapids and falls for 700 feet; 2.7 feet fall; balance good water. Total fall 5.19 feet.

Twenty-sixth mile.—Elevation 2283.87 feet; mouth of Little River, shoal for 800 feet. Total fall 2.61 feet.

Twenty-seventh mile.—Elevation 2281.26 feet; pool 2200 feet long; one shoal 300 feet long; ½ foot fall; pool 1200 feet long; balance flows rapidly. Total fall 5.16 feet.

Twenty-eighth mile.—Elevation 2276.10 feet; 900 feet shoal at Collins's old ford; fall 1.8 feet; balance good water. Fall per mile 4.17 feet.

Twenty-ninth mile.—Elevation 2271.93 feet; pool for 3300 feet; shoal for 2000 feet. Total fall 4.97 feet.

Thirtieth mile.—Elevation 2266.96 feet; shoals and pools about equal. Fall in the mile 6.44 feet.

Thirty-first mile.—Elevation 2260.52 feet; one shoal for 200 feet and another for 800 feet; fall 8 feet. Fall in the mile 3.24 feet.

Thirty-second mile.—Elevation 2257.28 feet; Island Ford, rapids for 700 feet; 2.3 feet fall; one small vertical fall and then rapids for 400 feet. Total fall 5¾ feet.

Thirty-third mile.—Elevation 2251.53 feet; rapids for 800 feet, then succession of short rapids and pools, and a fall of
1½ feet in 200 feet. Total fall 8.05 feet.
2986 Thirty-fourth mile.—Elevation 2243.48 feet; one shoal
1[illegible]00 feet long; fall 2 feet; one shoal 600 feet long; fall 1 foot. Fall per mile 4.31 feet.

Thirty-fifth mile.—Elevation 2239.17 feet; one shoal 200 feet in length; one shoal 1000 feet long and rocky. Fall per mile 3.35 feet.

Thirty-sixth mile.—Elevation 2235.82 feet; for 800 feet rocky and rough, but good water; one shoal 500 feet long. Fall in the mile 3.86 feet.

Thirty-seventh mile.—Elevation 2231.96 feet; good water. At end very wide; some sand islands. Total fall 3.37 feet.

Thirty-eighth mile.—Elevation 2228.59 feet; slightly shoal for 1200 feet; fall 1.6 feet one shoal 150 feet long. Fall per mile 3.38 feet.

Thirty-ninth mile.—Elevation 2225.21 feet; one shoal 500 feet long; 1.3 feet fall; balance good water. Total fall 4.6 feet.

Fortieth mile.—Elevation 2220.61 feet; good navigation. Fall per mile 5.31 feet.

Forty-first mile.—Elevation 2215.30 feet; one shoal 800 feet long at Garrison's Ford. Total fall 2.18 feet.

Forty-second mile.—Elevation 2213.12 feet; good water. Fall per mile .9 foot.

Forty-third mile.—Elevation 2212.22 feet; at end Boone's Ford; quite wide, shoal for 2400 feet, and in it a fall of 1 foot in 200 feet. Total fall 4.76 feet.

Forty-fourth mile.—Elevation 2207.46 feet, Bull Run Falls; one fall 1.2 feet in 450 feet and rapids 1600 feet long; then a fall of 1 foot in 400 feet, and rapids for 300 feet with 1 foot fall; then water flows over 3 ledges and rapids for 1700 feet, full of bowlders; fall 9½ feet. Fall per mile 16.1 feet.

Forty-fifth mile.—Elevation 2191.36 feet; 1 foot fall in 450 feet; pool 1300 feet long; 3 ledges and rapids, Mallory's Falls for 1700 feet; fall 12 feet; then pool for 1800 feet. Total fall 15.98 feet.

Forty-sixth mile.—Elevation 2175.38 feet; 3 falls and rapids; De Priest's 1900 feet long; fall 14 feet; then rapids for 1400 feet; Bartlett's Shoals and Rapids, at end, 1750 feet long; 6 feet fall. Fall per mile 21.15 feet.

Forty-seventh mile.—Elevation 2154.23 feet; 1750 feet
2987 full of rock and some gravel, but good water; 6½ feet fall;
one shoal 300 feet long, also some sand islands; balance pool. Fall per mile 10.45 feet.

Forty-eighth mile.—Elevation 2143.78 feet; good water. Total fall 1.3 feet.

Forty-ninth mile.—Elevation 2142.48 feet; good navigation for 2700 feet; then Dickinson's Shoals and Ford for 2600 feet; fall 5½ feet. Fall per mile 6½ feet.

Fiftieth mile.—Elevation 2135.98 feet; Dickinson's Rapids and Falls, a succession of heavy falls and rapids with three short pools. Fall for the mile 25.66.

Fifty-first mile.—Elevation 2110.32 feet; Surgener's Rapids and Falls; 3 falls and 3 short pools. Fall in the mile 22¾ feet.

Fifty-second mile.—Elevation 2087.57 feet; 700 feet lower portion of Surgener's Falls; pool 1800 feet long; fall 2½ feet; ends in Dowling's Falls and Rapids. Fall in the mile 15¾ feet.

Fifty-third mile.—Elevation 2071.82 feet; Grayson's Springs, Shoals, Rapids, and Falls; consisting of 4 shoals, 3 short pools, and 1 small fall at end. Fall in the mile 21.79 feet.

Fifty-fourth mile.—Elevation 2050.03 feet; fall ½ foot in 50 feet; shoal for 600 feet; fall 2½ feet; then the Gulf, consisting of rapids and two falls, in all 10 feet; very rough and full of bowlders. Total fall 11.65 feet.

Fifty-fifth mile.—Elevation 2038.38 feet; good water; Allen's Ferry. Fall per mile 10.80 feet.

Fifty-sixth mile.—Elevation 2027.58 feet; Early's Shoals, 500 feet long; fall 2.8 feet; pool 2500 feet long to beginning of Wilkinson's Falls. Total fall 1645 feet.

Fifty-seventh mile.—Elevation 2011.13 feet; Wilkinson's Rapids and Falls. Throughout this mile, water very swift, full of bowlders, loose rocks, and ledges entirely across the river. Fall per mile 28.05 feet.

Fifty-eighth mile.—Elevation 1983.08 feet; one shoal 800 feet long; fall 5 feet; one shoal 1100 feet long; fall 4 feet. Foot of Ewing's and Poplar Camp Mountains; limestone commences here. Total fall 16.40 feet.

2988 Fifty-ninth mile.—Elevation 1,966.68 feet; shoal for 2,600 feet; fall 6 feet; balance good water. Total fall 9¾ feet.

Sixtieth mile.—Elevation 1,956.93 feet; a ledge for 50 feet, and a fall of 1½ feet in 300 feet, but deep water; remainder of mile good water. Total fall 3.45 feet.

Sixty-first mile.—Elevation 1,953.48 feet; good navigation. Fall per mile 2.70 feet.

Sixty-second mile.—Elevation 1,950.78 feet; shoal 900 feet long and 3 ledges; fall 3 feet; 2 other ledges, but good water over them. The survey is 62 miles and 566 feet, but for convenience the feet are included in the last mile. The estimate is made for a lock and dam at the Lead Mines; the channel, however, between the island and the left bank of the river can be cut out to the proper width and depth, if desirable. Fall per mile 6.92 feet; elevation at top of dam 1,946.23 feet; elevation at foot of dam 1,943.86 feet.

After a careful examination of the map and profile, it is considered possible to improve the river to and including the 43d mile by the usual methods of excavation and lateral dams, with the exception of Osborn's Falls, where locks and dams will have to be introduced. Slack-water navigation will also have to be made for the next 14 miles through the mountains; from the base of these to the terminus, 5 miles, but slight work will be required.

The improvement of this portion of the river must be considered as a whole. It is not possible to divide it into sections and treat such separately with regard to lateral means of transportation, by railway or otherwise, for no such means exist.

Perhaps the best method of improvement that can be used in the wide, and of consequence shoal portions of the river, is to build

dams to concentrate a sufficient quantity of water into the channel,
and then to reduce the grade and velocity by the use of low regu-
lating-dams with sluices in them. At present this portion of the
river is not used at all for transportation purposes. Only the
ordinary canoe is seen, and it is merely used for ferrying and
2989 fishing. For keel-boat navigation a channel 2 feet deep and
30 feet wide, with tracking or towing paths at the falls and
rapids, will answer all purposes.

Rock excavation, removing bowlders, sand, and gravel, and building lateral dams will cost for the—

62 miles, at an average of $1,200 per mile	$74,400
20,300 linear feet of towing-path, at $2	40,600
Total	$115,000

The resources of the country are such, however, as to require a steamboat navigation. For this a channel 3 feet deep and 90 feet wide, with a grade always less than 1 foot in 400 feet, it is thought, will suffice. A channel less wide could be used, but the velocity would be much increased.

The locks and dams are to be of crib-work filled with stone, for which an abundance of material is found all along the river. The estimate for the locks is based on that of an 8-foot lift, with 4 feet depth on the miter-sills, costing $11,500; and of the following dimensions: walls, 11½ feet wide and 17 feet high; chambers, 25 feet wide and 120 feet long; total length, including lower wings, 175 feet; total width, 48 feet.

The dam corresponding to a lock of the above description is estimated as having a width of 16 feet, a front 12 feet high, and a back 8 feet high, with supporting walls 8 feet apart longitudinally. Top covered with 3-inch plank, and at the crest an ice-breaker 3 inches thick and 6 feet deep. Estimated cost per linear foot, $20. Each abutment is estimated as equal in cost to 55 linear feet of dam. The smaller dams are estimated at an average height of 6 feet, with a width at base of 12 feet.

The proposed locks and dams are shown in red on the maps. All shoals not otherwise marked are indicated to have sluice-ways cut through them. . .

Owing to the large rain-fall and extensive rises in the river during the progress of this survey, and the limited time to be devoted to it, it was found impossible to locate accurately the locks and dams mentioned as a part of the suggested system of navigation. Sufficient data, it is believed, however, was obtained to make the estimate submitted below, for a 3-foot navigation, nearly correct.

2990 TABLE SHOWING THE ESTIMATED COST OF EACH MILE FOR 3-FOOT NAVIGATION

First mile	$13,800
Second mile	4,400
Third mile	7,000
Fourth mile	4,300
Fifth mile	15,300
Sixth mile	36,500
Seventh mile	8,700
Eighth mile	700
Ninth mile	3,700
Tenth mile	59,600
Eleventh mile	12,300
Twelfth mile	10,400
Thirteenth mile	10,600
Fourteenth mile	15,700
Fifteenth mile	18,000
Sixteenth mile	10,600
Seventeenth mile	6,400
Eighteenth mile	10,500
Nineteenth mile	00,000
Twentieth mile	00,000
Twenty-first mile	16,900
Twenty-second mile	6,000
Twenty-third mile	11,500
Twenty-fourth mile	4,100
Twenty-fifth mile	7,000
Twenty-sixth mile	7,000
Twenty-seventh mile	2,100
Twenty-eighth mile	4,600
Twenty-ninth mile	7,100
Thirtieth mile	14,900
Thirty-first mile	11,200
Thirty-second mile	4,500
Thirty-third mile	$8,500
Thirty-fourth mile	9,500
Thirty-fifth mile	6,800
Thirty-sixth mile	3,200
Thirty-seventh mile	5,000
Thirty-eighth mile	3,000
Thirty-ninth mile	2,500
Fortieth mile	0,000
Forty-first mile	4,000
Forty-second mile	0,000
Forty-third mile	13,200
Forty-fourth mile	48,300
Forty-fifth mile	51,600
Forty-sixth mile	43,400
Forty-seventh mile	38,800
Forty-eighth mile	00,000
Forty-ninth mile	13,900
Fiftieth mile	75,800
Fifty-first mile	78,400
Fifty-second mile	44,100
Fifty-third mile	44,400
Fifty-fourth mile	35,000
Fifty-fifth mile	00,000
Fifty-sixth mile	57,800
Fifty-seventh mile	81,800
Fifty-eighth mile	50,500
Fifty-ninth mile	13,200
Sixtieth mile	2,500
Sixty-first mile	0,000
Sixty-second mile	21,100
Total	1,101,700

The amounts in the following table are included in the table for estimated cost per mile.

TABLE SHOWING THE ESTIMATED COST OF EACH LOCK AND DAM FOR 3-FOOT NAVIGATION

The abutments are regarded as a part of the dam, and included in its estimate, but the table shows the actual length of dam without abutments)

No. of locks	Location	Lift of lock	Cost	Linear feet in dam	Cost	Total
		Feet				
1	Osborne's Falls, tenth mile	8	$11,500	270	$7,600	$19,100
2	do	7	11,000	290	7,600	18,600
3	do	5	10,000	370	8,200	18,200
4	Bull Run Falls, forty-fourth mile	10	12,500	540	24,500	37,000
5	Mallory Falls, forty-fifth mile	7	11,000	700	15,600	26,600
6	do	5	10,000	670	13,300	23,300
7	De Priest's Falls, forty-fifth mile	8	11,500	450	11,200	22,700
8	do	6	10,500	350	8,300	18,800
9	Bartlett's Rapids, forty-seventh mile	10	12,500	890	22,200	34,700
10	Dickinson's Falls, fiftieth mile	10	12,500	590	15,400	27,900
11	do	6	10,500	510	11,200	21,700
12	do	9	12,000	430	11,300	23,300
13	Sergener's Falls, fifty-first mile	10	12,500	490	13,200	25,700

STATEMENT OF FOREGOING ESTIMATE

136,750 yards of rock excavation, at $2 yer yard	$273,500.00
10,121 yards of bowlder excavation, at $1.65 per yard	16,700.00
90,200 yards of loose rock and gravel, at 75 cents per yard	14,400.00
26,800 linear feet of small dams, at $5 per foot	134,000.00
28 locks and dams	663,100.00
Total	1,101,700.00

A lock-and-dam navigation of 5 feet from the mouth of Wilson to the Lead Mines, overcoming a fall of 507 feet in 62 miles, will cost—

Locks and dams	$1,524,000.00
38,000 yards rock excavation, at $2	76,000.00
Total	1,600,000.00

SUMMARY

Two-foot navigation	$115,000.00
Three-foot navigation	1,101,100.00
Five-foot navigation	1,600,000.00

The counties traversed by the river within the limits of this survey are Grayson, Carroll, and Wythe, in Virginia, and Alleghany in North Carolina. These, with Ashe, a portion of Watauga, and Surrey, North Carolina, are dependent upon the river for a commercial outlet.

Alleghany County produces wheat, corn, oats, rye, buckwheat, potatoes, tobacco, hay, wool, butter, sheep, hogs, cattle, horses, &c. The growth of tobacco is a new industry, and the product small as yet. There has been some improvement in the mode of farming and in the yield of products since the census of 1870. The Peach Bottom Copper Mine, located in this county, 8 miles from the Mouth of Wilson, 12 miles from Independence, and 3 miles south of the river, was worked before the late war, but is now idle. The Elk Creek Iron Furnace is located 6 miles from Mouth of
2992 Wilson. The ore used is found in extensive deposits on both sides of the river in Alleghany County, North Carolina,

and Grayson County, Virginia, about 7 miles from Mouth of Wilson. Mine and furnace both idle. The Collins Iron Works, about 16 miles east of Mouth of Wilson, in this county, are now idle. There are deposits of iron, and indications of copper, asbestos, mica, and other minerals in various parts of this county, which only require capital and enterprise for their development.

The productions of Ashe County, North Carolina, are very similar to those of Alleghany. Ashe has a larger area of improved lands and more wealth; the quality of the soil is also better; hence the agricultural products are larger though the same in kind. Ore Knob is located in this county about 15 miles above the Mouth of Wilson, and 3 miles from the south fork of New River. This mine is extensively worked by a Baltimore company, Mr. James Clayton, the principal proprietor, managing it. Only the pure copper is shipped to market, and that over a very rough and mountainous road at great expense. By increased facilities for transportation, the sulphur and peroxide of iron, now worthless and waste products, could be utilized.

There is also another vein of copper at Elk Knob, about 35 miles southwest of the Mouth of Wilson, in Watauga County; this mine is said to be very rich in its copper deposits, and some work is about commencing there for the purpose of testing their extent.

Hilton Furnace is situated in the county of Grayson, 10 miles west of the Mouth of Wilson. Extensive deposits of iron ore are found on both sides of the State line, and said to be of the finest quality. Furnace not now in operation.

There are also valuable soapstone quarries in Ashe County. One quarry near Jefferson, about 20 miles southwest of Mouth of Wilson, furnishes the supply of soapstone for the furnaces at Ore Knob, of a very superior quality and as white as alabaster.

Surry County, North Carolina, differs but little in its agricultural products from the other counties named, only in tobacco
and sweet potatoes, which are extensively raised here.
2993 Nothing was ascertained about the mineral productions of
this county.

There are extensive manufacturing establishments at Elkins and Mount Airy. At the former place, cotton and woolen establishments; at the latter, cotton, woolen, and tobacco factories, and also a factory for making ax handles, &c., and another for boots and shoes. Mount Airy is about 50 miles east of Mouth of Wilson, and 20 miles south of New River at the nearest point. Elkins is about 45 miles southeast from Mouth of Wilson, and 24 miles south of New River. Dr. William Hampton has opened a valuable copper mine near the mouth of Little River, in Grayson County, Virginia, but as yet it is not worked. He has also a soapstone quarry near by.

Grayson, Carroll, and Wythe are reported to be better agricultural counties than those described above, and their mineral resorces are wonderful. Cripple Creek, in Wythe County, is lined with iron furnaces. Snow Hill Branch, in the same county, has on it, near the river, large quantities of iron, zinc, and lead ores. It is deemed unnecessary, however, to give any further description of the resources of these counties, for the subject is thoroughly treated, as heretofore stated, by Colonel Abert and Maj. N. H. Hutton, in their reports, Appendix W of Annual Report of the Chief of Engineers of the United States Army for 1875, and Appendix T of Annual Report of same officer for 1873, to which attention is respectfully called.

I am indebted to Col. A. M. Davis, of Independence, Grayson County, Virginia, for much valuable information with regard to the resources of the counties in North Carolina.

Much credit is due J. M. Wolbrect, transitman, M. Cooke, leveler, and J. D. Hoffman, draughtsman, for the efficient performance of their respective duties.

Respectfully submitted.

Wm. Proctor Smith,
Civil Engineer.

Col. William P. Craighill,
Major Engineer Corps, U. S. A.

Report of the Chief of Engineers, Year 1880

(pp. 107–108; 676–681)

19. New River, from the mouth of Wilson, in Grayson County, Virginia, to mouth of Greenbrier River, in West Virginia.—This improvement was commenced in the summer of 1877 on the section of the river just above New River Bridge, in Pulaski County, Virginia, the crossing of the Virginia and Tennessee Railroad, and continued in the low-water season of 1878. It is for the benefit of the bateaux now in use and for very light steamboats, and consists in giving a depth of channel of about 2 feet at low-water, the width to vary from 30 to 50 feet according to location and direction. This plan involves the blasting under water and removal of ledges and loose rock, placing the debris in wing-dams and training walls, excavating through gravel shoals and placing the material in the hearts of the dams, and thus making sluices and chutes, affording a good waterway without too much increasing the velocity and volume of the water in them. The operations on this section covered about 13½ miles.

In September 1878, for special reasons, the working force was transferred to the section of the river near Hinton. The character of the work has been the same. The space worked over has been about 15 miles. A small steamer has been put on this section.

Before the improvement was begun navigation was suspended during low-water. It can be continued now at any season on the improved portions.

In the last river and harbor act, Congress specially appropriated, for the first time, for the portion of the river above the Lead Mines in Wythe County, Virginia, thus extending the area of operations.

The total amount expended up to June 30, 1880, has been $41,916.74, with the results as stated above.

The last appropriation of $24,000, of June 14, 1880, will be expended according to the plan already indicated: $12,000 on
2995 the Greenbrier or lower section, over about 8 miles of new
work, and in perfecting some of the old, about 20 miles in all; $7,000 on the middle or New River bridge section, as high up, it is hoped, as Mac's Creek, about 19 miles from the bridge; $5,000 on the upper section, where the work will be entirely new and its limits cannot be accurately defined at present.

The appropriation of $24,000, asked for the year ending June 30, 1882, it is proposed to apply in the same proportions to the several sections of the river as this year.

July 1, 1879, amount available	$16,304.48
Amount appropriated by act approved June 14, 1880	24,000.00
	$40,304.48
July 1, 1880, amount expended during fiscal year	16,221.22
July 1, 1880, amount available	24,083.26
Amount (estimated) required for completion of existing project	205,000.00
Amount that can be profitably expended in fiscal year ending June 30, 1882	24,000.00

G 19

Improvement of New River From the Mouth of Wilson, in Grayson County, Virginia, to Mouth of Greenbrier River, in West Virginia

The full title of the last appropriation for this river is the following:

Improving New River from mouth of Wilson, in Grayson County, Virginia, to mouth of Greenbrier River, $24,000, of which sum $12,000 shall be expended in the continuation of the work from the mouth of Greenbrier up, $7,000 in the continuation of the work formerly prosecuted on the river in Wythe County, and $5,000 between the lead mines, in Wythe County, and the mouth of Wilson, in Grayson County.

The appropriation is divided into three parts. The general plan of improvement adopted has been for the keel-boats now in use on the river, viz, to give a depth of channel of about 2 feet at low-water, the width to vary from 30 to 50 feet, according to location and direction. This plan involves the blasting under water and removal of ledges and bowlders, placing the debris in wing-dams and training walls, excavating through gravel shoals and placing the material in the hearts of the dams, and thus making sluices and chutes affording a good water-
2996 way without too much increasing the velocity and volume
of the water in them. All this work has been so irregular in character as to lead to the rejection of the contract method of doing it, and to the adoption of the method of procuring materials and labor by open purchase and hire as needed.

The first appropriation for this river was made August 14, 1876, and was for $15,000. Subsequent grants, including that of June 14, 1880, $24,000, have amounted to $66,000. The first work undertaken was in the summer of 1877, under the immediate supervision of Capt. James W. Cuyler, Corps of Engineers, on the section of the river above the crossing of the Virginia and Tennessee Railroad, in Pulaski County, Virginia. The working season on this river is necessarily short, being limited to that of low-water and warm water, as most of the work is best done by men standing in the water. Captain Cuyler's operations were successfully prosecuted in the summer and early autumn of 1877, resumed in 1878, and continued until the severe freshet of September, 1878, which caused a considerable loss of property and some damage to the unfinished portions of the work. The details of Captain Cuyler's work are fully stated in his reports in the Annual Reports of the Chief of Engineers for 1878 and 1879.

In August, 1878, it was decided to commence work at once on the section of the river immediately above the mouth of Greenbrier, at Hinton, in West Virginia, as the indications of immediate usefulness of the improved river in that section seemed greater than in the section worked over by Captain Cuyler. The operations near Hinton were placed under the supervision of Mr. A. M. Scott, and vigorously continued until near the end of

November, 1878. The work was resumed in June, 1879, under Col. William Proctor Smith. The reports of Mr. Scott and Colonel Smith in the annual report for 1879, and hereto appended, give the detailed history of the progress made up to June 30, 1880. A steamboat has been built at Hinton and runs on the river, taking advantage of the improvement as high as it has been carried above that point, about 15 miles. The bateaux have much greater ease in navigation and can carry larger loads. Other incidental advantages are mentioned by Colonel Smith in his report.

2997 If the appropriation of 1880 had been available earlier, advantage could have been taken for operations in the whole working season. As much will be done as can be. Operations will be resumed at once on the Greenbrier section, and to expend the portion of the money thereto allotted in the law, in making needed improvements in the channel already commenced and in use between Hinton and War Ford Shoals, a space of 11¾ miles; in finishing War Ford Shoals; in improving that portion of the river from War Ford Shoals to the mouth of Lick Creek, about 8 miles of new work. The last work is subdivided into eleven parts at different points.

Nearly two years having elapsed since the cessation of work on the section above New River Bridge, in Pulaski County, it will be necessary, although it is reported as in good condition, to make a careful examination there before it can be determined what should be undertaken. No unnecessary delay will be had in entering upon the work in this section as well as upon the section from the lead mines, in Wythe County, to the mouth of Wilson, in Grayson County. Of this last part a survey was made by Col. William Proctor Smith in 1878. A report thereof may be found in the Annual Report of the Chief of Engineers for 1879, page 538, Appendix F. No work has been done upon that portion of the river, but what is appropriate is supposed to be the same as has been in progress on the other parts. The estimate for a 2 feet navigation for bateaux, was $115,000; for a 3 feet steamboat navigation, $1,200,000; and for a 5 feet steamboat navigation, $1,600,000.

The combined estimates for the completion of the improvement of the three sections of the river for navigation by bateaux and small steamboats amount to $205,000. The same amount is asked for appropriation at the next session of Congress as was just granted, viz, $24,000, to be divided along the river as in the law of June 14, 1880.

2998 REPORT OF MR. WILLIAM PROCTOR SMITH, ASSISTANT ENGINEER

BALTIMORE, MD., *March 30, 1880.*

COLONEL: According to instructions received from you May 1, 1879, I examined the notes, maps, and reports of the New River improvement, in your office, in order to familiarize myself with my new duties.

On the 12th of May I went to Hinton, W. Va., and next day to Charleston, W. Va., to confer with Mr. A. M. Scott, assistant engineer in charge; returned on the 15th and formally took charge on the 20th, at which time Mr. Scott transferred the property.

From that time until the 3d of June, preparations were made for the season's operations, and a small force was set at work building walls in Greenbrier Shoals; not until the 16th, however, could any blasting be done, as the river was too high and muddy.

A full account of operations from the time I took charge to July 1, will be found in my reports for May and June.

From July 1 to November 8, 1879, the work was prosecuted with vigor, with a loss of only thirteen days out of a possible 113, and four of these were lost on account of delay in making the appropriation for 1879 available. The season was exceptionally good, so much so that I was not able to change one of the gravel-boats into a craneboat, which you authorized, as I wished the laborers employed on the work to make the change in bad weather, and thus keep them occupied.

The river remained nearly all of the time below the zero established last season and regarded as ordinary summer low-water, corresponding to a reading of 1.6 feet on the Hinton gauge. At one time the water was 7 inches below the point referred to. No one living on the river had ever seen it so low.

On the 8th of November 1879, I struck camp and moved to Hinton, and on the 30th finished all of the surveys.

The number of men employed averaged about eighty, and were divided into three parties; this was rendered necessary, as the

work was much scattered, at one time as much as 7 miles between
extremes. These parties were in camp, the men boarding
2999 themselves. I have two camps, one at the mouth of Blue
Stone River, 4½ miles above Hinton, and the other at the
upper end of War Ford, 12¼ miles above the same place.

There was no difficulty in getting laborers and wages were low, viz, $1 per day of ten hours, until the 15th September, at which time wages were increased to $1.25, and maintained so until the 1st of November, when $1.50 per day had to be paid for ten men five or six days, as the water was exceedingly cold. This was necessary, as it was desirable to get a channel, even though narrow, through War Ford Shoals.

The same dimensions of channel were adopted as used last season, 50 feet wide and 2 feet deep at ordinary low-water, which for this season would give about 18 inches at extreme low-water, and from 20 to 22 inches during an ordinary summer. In many places where there was a bend in the channel it was given a width of from 75 to 100 feet.

The material excavated was soft and had sandstone, loose rock, gravel, and large bowlders. The obstructions to navigation consist of a series of shoals from 100 feet to two-thirds of a mile in length, and the greater part of these composed of a series of ledges of solid rock, through which the channel had to be cut. So far as the work has progressed, comparatively small amounts of gravel and loose rock have been found, and no sand.

When it was practicable, the channel was located in the bateau "chutes" to save expense. In a number of instances, however, this would not answer and a straight line was adopted. In several cases the channel is crooked, as for instance, at the head of Greenbrier Shoals and the foot of Gartin's Ledges. To straighten these would have cost so much as to prevent much needed improvements beyond.

Upon the assurance of the owners of the steamboat that they could, and as they actually did, navigate these places, and at their urgent request, the work was carried on farther up the stream. The desire of the steamboat owners to get their boat through War Ford Shoals to Crump's Bottom, caused several points to be left in an unfinished condition, viz: Greenbrier Shoals, in which two walls should be built to check cross currents, the lower "chute" somewhat widened, and a small portion
of the lower ledge taken off. Some rock should be re-
3000 moved from the upper end of Deer Lick Ledges, and
possibly some gravel removed at the foot of Landcraft's
Shoals, as well as a slight wall at Tom's Run Ledges, and points of some of the ledges should be softened down between Hinton's Landing and the mouth of Greenbrier River.

The improvement, as now made, enables the steamboat to go up 12½ miles at ordinary low-water, and with a rise of 7 inches she can go, and has gone, up above Crockett's Store, 15 miles from Hinton.

The work is of great benefit to bateaux, enabling them to go through with a great deal of ease and to carry much larger cargoes than formerly, and, in fact, they can run now where it was utterly impossible before, owing to low water. Of these lines there are three, one to Bluestone, 5 miles, one to Crockett's Store, 14½ miles, and one to Lick Creek, 20 miles above Hinton.

It is also an advantage to the lumber business, as rafts can get through easily, and many hundred thousand feet have been taken down the stream this season from the region of the Bluestone.

The country is beautiful, with the usual river hills, the tops and sides of which are cultivated to a considerable extent, with here and there fertile bottoms. At the head of the improvement this season begins Crump's Bottom, which is 5 miles long and exceedingly rich.

Notwithstanding the heavy grade a large number of wagons, laden with agricultural products of a rich portion of Mercer County, daily uses a road which crosses the river by ferry just above Bull's Falls, and leads thence down the stream to the Chesapeake and Ohio Railroad at Hinton.

Going up farther, to the mouth of Indian Creek, another road is met, which leads, with a fine grade, to the Red Sulphur Springs and beyond, and as this celebrated watering place is only 6 miles distant, it would be a pleasant trip for persons wishing to visit it to take boat at Hinton, pass delightfully the few hours occupied in making the 16 miles in relaxtion from railroad travel and in viewing the beautiful scenery. Arriving at the point referred to, coaches could carry them to their destination.

The best road in the country, however, comes to and crosses the stream at the mouth of Lick Creek, 20 miles above
3001 Hinton. By this route nearly all of the marketable stuffs from the rich counties, Tazewell, Mercer, and Monroe, seek an outlet. Taking this into consideration, it is regarded as very desirable to push the improvement to that point next season, if possible.

With regard to the boat, it now, at low-water, makes trips three times a week to Bull's Fall, and, when there is a slight rise, extends them to Crockett's Store.

The machinery is somewhat too light for the dimensions of the boat, and it is in contemplation to either reduce its size and use the same machinery, or else let it remain as it is and increase the power.

There is no doubt about the steam navigation on this river being a success, for there is plenty of water, as the following observations for quantity, a few hundred feet above Bull's Fall will show, and all that is necessary is for it to be concentrated into one channel.

The quantity of water at the point referred to is 2,100 cubic feet per second at the extremest low-water, quite sufficient for any system of improvement.

Further, with regard to the resources of this country, it may be well to state that for miles south of and including Peter's Mountain, at the "Narrows" along the river, there is a large amount of brown and red hematite and specular iron ore.

A narrow-gauge railroad is now being constructed along the banks of the stream, and as it will cross at some point, as yet undetermined, the question of a draw in the bridge, or of a grade sufficient to allow the boat to pass under, will have to be looked into.

As giant powder or dynamite had been thoroughly tested the previous season, its use was continued with good effect. After the rock was blasted the stone was placed by hand on "jolly-boats" and carried to the walls, which were built with sufficient strength and height, but without regard to slopes. Wing-dams were built in a similar manner.

Ring-bolts, to which lines are attached to "wind" through the difficult "chutes," have been placed at frequent intervals.

From the tables, which give in detail much information
3002 with regard to the work, it will be seen that Bull's Fall has
a grade of 1 foot in 100 feet, and a current of 7 miles per
hour, and yet the boat "winds" through without difficulty. Owing
to the strong current it was very difficult to make the shelter-dams
stand in these falls. The work, however, was prosecuted with
energy in good weather and without accident. The successful
means employed in making this channel will be of great benefit
when similar falls, found above, are to be improved.

War Ford Shoal is 2,200 feet long, with a fall of 1 foot in the upper 1,000 feet, and 5.4 feet in the lower 1,200 feet. In the latter, which has a current of 4 miles per hour, it is thought that a wire cable may be used with advantage for "winding." The width of channel in the upper portion, as left this season, is only 30 feet; this will have to be given the proper width as early as possible. The velocity of the water in this section is about 2 miles per hour.

Through the main "chutes" at Garten's Ledges, Bluestone Shoals, and lower Greenbrier Shoals, the current is strong and grade heavy, but the boat has not experienced any difficulty in getting through.

To finish the work as now projected, from Hinton to the upper end of War Ford Shoals, will require $2,000.

From War Ford Shoals to the mouth of Lick Creek, 20 miles above Hinton, will require $11,000.

Beyond this point I have not sufficient data to make an estimate; it is not important, however, for the work cannot begin until a new appropriation is made, which will necessarily cause the working to be so short as to render it doubtful whether the improvement can be carried to Lick Creek, much less beyond.

In a good season it is thought that $25,000 can be advantageously expended on this improvement.

Detailed maps of the points worked at have been made on a scale of 100 feet to the inch, comprised in 9 sheets. Also one showing the readings of the water-gauge at Bluestone and War Ford during the working season.

A map of New River, from the steamboat landing at Hinton to the upper end of War Ford, 12¼ miles, showing the positions of the shoals and ledges, with appropriate references to maps in detail, on a scale of 800 feet to the inch, accompanies this report. 3003

The property belonging to the improvement is stored at Mr. M. Smith's, near Bull's Fall.

I am much indebted to Mr. T. Schoonmaker, superintendent, for valuable services rendered in construction, surveying, and mapping.

Respectfully submitted.

Wm. Proctor Smith,
Assistant Engineer.

Col. Wm. P. Craighill,
Major, Corps of Engineers, U. S. A.

TABLE SHOWING THE DISTANCES FROM STEAMBOAT LANDING AT HINTON, W. VA., TO FOOT OF SHOALS AND LEDGES, THEIR LENGTH OR WIDTH, AND DIFFERENCES OF LEVELS BETWEEN THE HEAD AND FOOT OF SAME, 1879

Shoal or ledge	Distance in miles	Length or width in feet	Fall in feet
Ledges between Hinton and Greenbrier Shoals	¼	5,940	4.95
Greenbrier Shoals	1½	3,700	7.20
Pack's Ferry Ledge	3½	200	0.70
Deer Lick Ledges	4½	200	1.83
Bluestone Shoals	4⅞	380	2.47
Landcraft's Ford Shoals	5⅛	2,950	2.20
Landcraft's Shoals	5⅞	1,900	4.05
Buffalo Shoals	7½	2,400	3.35
Barker's Shoals	8⅝	100	0.75
Gartin's Ledge Shoals	9	4,000	4.34
Ellis's Shoals	10¾	1,200	1.75
Bull's Fall	11⅛	300	2.70
Tom's Run Ledges	11⅜	200	1.70
War Ford Shoals	11¾	2,200	6.40

The readings of the temporary water-gauges, and during the season, were noted at the time the above levels were taken, and all found to be below the zero or ordinary low-water mark, except Ellis's which was slightly above.

Elevation of the mouth of Greenbrier River above tide-water — 1.352 feet
Elevation of the head of War Ford Shoals above tide-water — 1.406 feet

3004 TABLE SHOWING THE QUANTITY AND QUALITY OF MATERIAL EXCAVATED IN MAKING CHANNEL, 1879

Location	Solid rock	Loose rock	Gravel	Total

Total	8,564	1,690	984	11,238

	Per cubic yard
Total excavation, including all materials	$1.60
Solid rock	1.72
Loose rock	1.00
Gravel rock	1.60

The gravel is high, owing to its having to be removed by hand, with shovels, in very swift water.

The quantities were obtained by measuring the main and wing walls, composed of the material excavated.

TABLE SHOWING DETAILS OF BLASTING, 1879

Number of holes drilled		6,843
Number of feet of holes drilled	feet	12,023
Average depth of holes	do	1.73
Average depth of holes (1½ inches) drilled per day per drill	do	13.35
Number of blasts fired		7,003
Number of blasts missed		160
Average charge of powder in each cartridge	pounds	0.383
Average loosening of rock for blast	yards	1¼

REPORT OF THE CHIEF OF ENGINEERS, YEAR 1881

(pp. 144–145; 904–911)

21. New River, from the mouth of Wilson, in Grayson County, Virginia, to mouth of Greenbrier River, in West Virginia.—From the mouth of Wilson, in Grayson County, Virginia, to steamboat landing at Hinton, Summers County, West Virginia, 1½ miles below the mouth of Greenbrier River, is 191½ miles. The appropriations have been made in such a manner as to divide this portion of the river into three sections as follows:

	Miles
Upper or Lead Mines	62
Middle or New River Bridge	43
Lower or Greenbrier	86½

Throughout this distance, the navigable channel originally consisted of natural chutes, through the ledges and shoals, of varying widths, rarely over 1 foot in depth, in some places so tortuous as to render navigation extremely difficult and dangerous.

The original project adopted for the improvement of these natural channels was to widen them to 30 or 50 feet, as might be required, and deepen them to 2 feet, and straighten such as needed it. This was for keel-boat navigation, the improvement, however, to be made in such a manner as to aid the work, should a greater depth and width be required in the future.

A small steamboat, draught 12 inches, when light, having been built at Hinton, in the fall of 1878, rendered it necessary to make the channel, in that section, 50 feet wide at all points, and in many from 75 feet to 100 feet, the depth of 2 feet being retained.

June 30, 1880, there was a channel, 50 feet wide and 2 feet deep, from Hinton Landing to Hubbard's Ripple, a distance by river of 12¼ miles, giving an outlet to the products of Mercer County, West Virginia.

3006 At the close of the season's work for 1880, there was a channel, of the same width and depth, from Hinton Landing to McDaniel's or Harvey's Falls, a distance of 17¾ miles, giving an outlet to the farmers and graziers of Crump's Bottom and the Indian Creek country. And, in addition to the above, 12 miles of improvement from New River Bridge to Peak's Creek, with a channel 30 feet wide and 2 feet deep, giving outlet for timber and farm products, but not available for iron or other ores, until Radford Furnace can be reached.

The appropriation for the fiscal year ending June 30, 1882, will carry the improvement on the Greenbrier division through Wiley's Falls, 26 miles above Hinton, passing the mouth of Lick Creek, 20 miles above Hinton, thus opening up the trade from Tazewell and other rich counties adjoining.

The appropriation for the fiscal year ending June 30, 1882, will carry the improvement on the New River Bridge division to Carter's Ferry, 33 miles above the bridge, and give an outlet to the iron from Radford Furnace, 18 miles above the bridge, to the ores from an iron mine 8 miles beyond, to Graham's new furnace and iron-works, the former 31 miles, and latter 33 miles above the bridge, as well as to two zinc mines in the same section.

The appropriation for the fiscal year ending June 30, 1881, will carry the improvement on the Lead Mines division to the "Gulf," 8 miles above the mines, giving outlet to charcoal and timber.

No appropriation for the fiscal year ending June 30, 1882.

With a channel, as now proposed, 20 feet wide and 2 feet deep, the estimate of $181,000 would be sufficient to complete it, but as that portion from Hinton to New River Bridge has to be made 50 feet wide, at a cost of about $2,000 per mile, the above amount should be increased to $275,000, and if it becomes absolutely necessary to use locks and dams for the improvement of some of the falls, this estimate will have to be further increased by the amount of their cost.

On the lower division there are 8 keel-boats, 6 tons each, 18 inches draught, loaded; one small stern-wheel steamboat, 30 tons, 18 inches draught, loaded, and another being built.

3007 On the middle division two keel-boats, of the same tonnage and draught as above, are in use carrying ores, and six more building.

On the upper division only canoes are in use. Many rafts on each of these divisions, but their number was not ascertained.

July 1, 1880, amount available	$24, 083. 26
Amount appropriated by act approved March 3, 1881	$24, 000. 00
	$48, 083. 26
July 1, 1881, amount expended during fiscal year, exclusive of outstanding liabilities July 1, 1880	16, 179. 09
July 1, 1881, amount available	31, 904. 17
Amount (estimated) required for completion of existing project	181, 000. 00
Amount that can be profitably expended in fiscal year ending June 30, 1883	25, 000. 00

G 21

IMPROVEMENT OF NEW RIVER FROM THE MOUTH OF WILSON, IN GRAYSON COUNTY, VIRGINIA, TO THE MOUTH OF THE GREENBRIER RIVER IN WEST VIRGINIA

The operations of 1880 subsequent to June 30 appear in detail from the following report of Col. W. P. Smith, Assistant Engineer, dated April 8, 1881:

BALTIMORE, MARYLAND, *April 8, 1881.*

COLONEL: I have the honor to submit the following report of operations on New River, Virginia and West Virginia, for the season of 1880.

A project for the expenditure of $12,000 appropriated for this work, from the mouth of the Greenbrier up, for the fiscal year ending June 30, 1881, was submitted to and approved by you early in July.

On the 26th I went to Hinton, W. Va., and commenced the work on the 2d of August, with a force of about 70 men, divided into two parties, under competent foremen. Later in the season another force was organized, composed of from 12 to 15 men, to make necessary improvements in the channel already made. The interval, from 26th July to 2d August, was used in getting ready for the work.

From August 2 to October 31 the work was carried on with good results; after that a party of 15 men was employed in trimming up the walls and getting out loose stone.

The latter part of the season being cool, the men dropped
3008 off considerably, reducing the general average for the whole time to fifty.

Out of eighty-nine working days only eight were lost; the gauge standing at or near zero, ordinary low-water never reading more than 1 foot above, nor 0.5 foot below.

The improvement of the former work consisted in building two walls in Greenbrier Shoals to check cross-currents and placing a ring-bolt at the head of the lower one; gravel taken out of the lower part of Land Craft's Shoal; stone removed from Garten's Ledges and Ellis Shoals; wall renovated at Bull's Fall; stone taken out, and channel widened at Tom's Run; width of channel increased from 30 feet to 50 feet in the upper 1,000 feet of War Ford Shoals, and on the south side a natural channel behind an island, 600 feet long, improved by blasting the rock at the upper and lower ends, and cutting off intermediate points; the steamboat now owned by an agent of the Standard Oil Company, which company is getting out a large number of staves in this section, will use this channel in high-water going up stream, the long "chute" to be used at all times for low-water.

This part of the work covers a river space of 12⅙ miles with a fall over the ledges and shoals of 44.09 feet, and with a combined length of shoals and ledges equal to 25,670 feet. This work is shown on the maps prepared the previous seasons.

The new work for 1880 consisted in opening a channel through Hubbard's and Sweeny's Ripples, three in all; Crockett's and Sweeney's Ledges, six in all; removing gravel from Indian Creek Shoals, also some loose rock, but not enough to classify, and

Crump's Ledges, five in number, composed of sound rock exceedingly hard, with iron pyrites running through it, rendering the drilling very difficult and expensive, making the average price for the season 20 cents more per cubic yard than last; the gravel, however, in Indian Creek Shoals was handled at small cost, reducing the average price to one-half what it was last season. One of the walls in Crump's Ledges will have to be extended to prevent washing of the banks; the weather got too cold to attend to it last fall.

3009. This work covers a river space of 5½ miles, with a fall of 10.54 feet over ledges and shoals and 6,460 feet of cutting through them, the shoals varying in length from 100 feet to 1,900 feet, the heaviest grade being less than 0.4 foot per 100 feet, levels taken with gauge reading at 0.5 foot above zero. For width or length, fall, distance from Hinton, and material taken out of shoals and ledges, reference is made to the tables.

The river is now open from Hinton Landing to McDaniell's or Harvey's Falls, a distance of 17¾ miles, with a channel 50 feet wide and 2 feet deep at ordinary and 18 inches at extreme low-water.

The actual amount of cutting through these ledges and shoals, in the entire distance, amounts to 6$1/12$ miles, with a fall over the same of 54.81 feet, levels taken with gauge reading nearly at zero; total fall 62 feet, averaging 3½ feet per mile.

Four thousand nine hundred and ten linear feet of new wall, averaging 8 feet wide and 3 feet high, were built, and 715 cubic yards of material put in old walls. Cost of solid rock $1.92 and gravel 71 cents per cubic yard.

Two and a half miles will carry the improvement to the mouth of Lick Creek, 20 miles above Hinton, a point which it is very desirable to reach to get freight from the rich counties adjoining, as fully set forth in Mr. A. M. Scott's report, May 26, 1879, and in mine March 30, 1880, forming a part of your annual report to the Chief of Engineers, United States Army, for 1880.

In this distance about $4,000 will have to be expended to get a channel through two falls, two ledges, and one shoal.

I would respectfully suggest that a careful survey of Neilly's or Shumate's falls and rapids, about 30 miles above Hinton, be made, with reference to a lock and dam at that point; they may possibly be improved by cutting a sluice along the left bank, but the survey should be made to ascertain its feasibility. Whole fall, 11 feet; 6 feet of this nearly vertical.

3010 Four lines of keel boats, eight in all, now run regularly on this part of the river, the improvement enabling them to carry two-thirds more freight than formerly; for instance, 1,500 feet of lumber used to be a load; now it is 4,500 feet.

The latter part of June you notified me that I was to assume control of the improvement of this river between New River Bridge, in Pulaski County, Virginia, and the lead mines in Wythe County, Virginia, for the continuation of which $7,000 had been appropriated, as well as the expenditure of $5,000 from the lead mines to the mouth of Wilson, in Grayson County, Va.

Accordingly, about the middle of August, as soon as the work from the mouth of Greenbrier up was well under way, I went to New River Bridge and examined the river to the mouth of Reed Island Creek, 26½ miles, with a view of getting data for making a project for the expenditure of the money appropriated for this section. That accomplished, I went to the lead mines and examined the river south to the foot of what is called the "Gulf," in Carroll County, Virginia, nearly 8 miles from the mines; then returned to Hinton and submitted project, as directed, for the improvements in these localities; was notified of the approval of the same September 15, and on 18th started for New River Bridge; got to work building boats and canoes 23d, and on October 4 commenced clearing out the channels made by Captain Cuyler, United States Engineers, during the seasons of 1877 and 1878, which had been injured to a considerable extent by the severe flood of September 14, 1878.

The principal part of this work, which extends from the bridge to Peake's Creek, 12 miles, was at Buck's Falls, where the supporting walls had been washed away and channel filled up; this channel is 30 feet wide and 2 feet deep for bateaux, with walls so arranged that it can be widened and deepened for steam navigation when desired.

The weather becoming cold the work was suspended on 1st November. The force having to be moved every few days, in three small boats, caused loss of time, and consequently increased the price of getting out the limestone rock to $2.10 and gravel to 95 cents per cubic yard.

Four hundred and thirty-eight linear feet of new wall
3011 was built, averaging 7 feet wide and 3 feet high, and 73
cubic yards of material put in old walls.

This work is shown on detail maps in your office, made by Captain Cuyler, United States Engineers.

The owner of Radford Iron Furnace, 18 miles above New River Bridge, as well as those of a furnace on Little Reed Island Creek, 26½ miles from the bridge, are anxious to send iron and ores down by bateaux; and, in addition, the following may be expected to ship: Forge at mouth of Little Reed Island Creek; Barren Spring Furnace; furnace near this belonging to Graham and Robinson; Bertha Zinc Works; Falling Cliff Zinc Works, to be started soon, and yet another, by a New York company, near the Bertha mine.

As only bateaux will navigate this stream for the present, the project submitted and approved calls for a channel 2 feet deep and 20 feet wide, which will allow rafts to pass as well as boats.

For further description of this improvement, reference is made to the following reports of Capt. J. W. Cuyler, Engineer Corps, United States Army, July 1, 1878, March 15, and July 3, 1879, forming a part of your annual report, for the same years, to the Chief of Engineers, United States Army.

These reports are referred to especially, as no new work was done this season, and all of the river gone over is minutely described therein.

From the lead mines up, it is proposed to make a channel as below, 2 feet deep and 20 feet wide, a width sufficient for bringing charcoal for the furnaces down in bateaux, and for rafts of timber, of which there is an abundance in this region; there are also large deposits of copper in Carroll County, which it is thought will be eventually mined and shipped over this route.

For 5 miles above the lead mines the obstructions in the river are about the same as described elsewhere; then the fall becomes very abrupt, as the mountains are here reached; these extend for 14 miles, which will necessarily make the work heavy for that distance.

For description of this section, reference is made to my
3012 report of a survey made of this part of the river, dated
January 10, 1879, contained in your annual report to the Chief of Engineers, United States Army, for the same year.

Owing to the lateness of the season, no work was done on this division.

As Foster's Falls, 37 miles above New River Bridge, offers such an obstruction to navigation as to prevent the lead mines and furnaces above from shipping their products down the river, it is respectfully recommended that a careful survey be made of them with a view to their improvement by locks and dams; "the fall is about 18 feet, over slate and limestone ledges, in 2,300 feet, with a short pool and a succession of ledges."

During the winter, the country in the vicinity of New River Bridge and the lead mines was explored in search of suitable timber for crane and other boats to be used on the works the coming season.

Much of the timber has been secured and boats are now being built.

Maps on a scale of 1 inch to 100 feet, comprised in four sheets, have been made, showing the details of the work on the Greenbrier division; also one exhibiting the readings of the water-gauge at War Ford.

Two maps showing portions of the river improved on a scale of 800 feet to an inch, one from War Ford to Harvey's Falls, 5⅔ miles; the other from New River Bridge to Peak's Creek, 12 miles, with appropriate references to detail sheets, accompany this report.

Tables explanatory of the work in detail, as well as others giving shipments from New River at Hinton Station, on the Chesapeake and Ohio Railway, and nine stations on the Atlantic, Mississippi, and Ohio Railway, are appended.

I am indebted to Charles F. Littlepage and Reuben Hurley for valuable assistance in the execution of this work, the former on the Greenbrier division, the latter at New River Bridge and the lead mines; their judgment and good management are to be commended.

3013

SUMMARY

From the mouth of Wilson, in Grayson County, Virginia, to steamboat landing at Hinton, Summers County, West Virginia, 1½ miles below the mouth of Greenbrier River, 191½ miles. The appropriations have been made in such a manner as to divide this portion of the river into three sections, as follows:

	Miles
Upper, or Lead Mines	62
Middle, or New River Bridge	[illegible]
Lower, or Greenbrier	86½

Throughout this distance the navigable channel originally consisted of natural chutes through the ledges and shoals, of varying widths, rarely over 1 foot in depth, in some places so tortuous as to render navigation extremely difficult and dangerous.

The original project adopted for the improvement of these natural channels was to widen them to 30 or 50 feet, as might be required, and deepen them to 2 feet, and straighten such as needed it.

This was for keel-boat navigation; the improvement, however, to be made in such a manner as to aid the work, should a greater depth and width be required in the future.

A small steamboat, when light, draught 12 inches, having been built at Hinton, in the fall of 1878, rendered it necessary to make the channel in that section 50 feet wide at all points, and in many from 75 feet to 100 feet, the depth of 2 feet being retained.

June 30, 1880, there was a channel 50 feet wide and 2 feet deep from Hinton Landing to Hubbard's Ripple, a distance by river of 12½ miles, giving an outlet to the products of Mercer County, West Virginia.

At the close of the season's work for 1880, there was a channel of the same width and depth, from Hinton Landing to McDaniell's or Harvey's Falls, a distance of 17¾ miles, giving an outlet to the farmers and graziers of Crump's Bottom and the Indian Creek country. And in addition to the above there are 12 miles of improvement from New River Bridge to Peak's Creek, with a channel 30 feet wide and 2 feet deep, giving outlet for timber and farm products, but not available for iron or ores until Radford Furnace can be reached.

The appropriation for the fiscal year ending June 30, 1882, will carry the improvement on the Greenbrier division through Wiley's Falls, 26 miles above Hinton, passing the mouth of Lick Creek, 20 miles above Hinton, thus opening up the trade from Tazewell and other rich counties adjoining.

The project as far as Lick Creek has been approved.

The appropriation for the fiscal year ending June 30, 1882, will carry the improvement on the New River Bridge division to Carter's Ferry, 33 miles above the bridge, and give an outlet to the iron from Radford Furnace, 18 miles above the bridge, to the ores from an iron mine 8 miles beyond, to Graham's new furnace and iron works, the former 31 miles and the latter 33 miles above the bridge, as well as to two zinc mines in the same section. The project as far as Jones's Ford Shoals, 20½ miles above New River Bridge, has been approved.

The appropriation for the fiscal year ending June 30, 1881, will carry the improvement on the Lead Mines division to the "Gulf," 8 miles above the mines, giving outlet to charcoal and timber. This project has already been approved. No appropriation for the fiscal year ending June 30, 1882.

With a channel, as now proposed, 20 feet wide and 2 feet deep, the estimate of $205,000 would be sufficient to complete it; but as that portion from Hinton to New River Bridge has to be made 50 feet wide, at a cost of about $2,000 per mile, the above amount should be increased to $275,000, and if it becomes absolutely necessary to use locks and dams for the improvement of some of the falls this estimate will have to be further increased by the amount of their cost.

The tables give a clear exhibit of the products shipped from the valley of New River at the various railroad stations in 1880, and also the tonnage received for the same section.

On the lower division there are eight keel-boats, 6 tons each, 18 inches draught, loaded. One small stern-wheel steamboat, 30 tons, 18 inches draught, loaded, and another being built.

On the middle division two keel-boats, of the same tonnage and draught as above, are in use carrying ores, and 6 more building.

On the upper division only canoes are in use. Many rafts are on each of these divisions, but their number was not ascertained.

Respectfully submitted.

Wm. Proctor Smith,
Assistant Engineer.

Lieut. Col. **Wm. P. Craighill,**
United States Engineer.

3013-A TABLE SHOWING THE DISTANCES FROM STEAMBOAT LANDING AT HINTON, W. VA., TO FOOT OF SHOALS OR LEDGES, THEIR LENGTH OR WIDTH, AND DIFFERENCE OF LEVEL BETWEEN THE HEAD AND FOOT OF SAME; ALSO, THE QUANTITY AND QUALITY OF MATERIAL EXCAVATED IN MAKING AND IMPROVING THE CHANNEL IN 1880

STATEMENT OF TONNAGE SENT FROM AND RECEIVED AT HINTON STATION, CHESAPEAKE AND OHIO RAILWAY, FOR THE FISCAL YEAR ENDING SEPTEMBER 30, 1880

(Furnished by R. P. Fisher, Auditor)

Articles	Hinton		New River	
	Sent	Received	From—	To—
Lumber	14,194.24	70.52	2,180.00	
Coal	99.12	530.52		
Salt	20.96	285.16		6.10
Bacon	27.20	22.52	20.40	22.52
Lard	2.12	100.40	2.12	100.40
Flour	3.20	57.60		
Whisky	.80	5.28		
Merchandise	136.32	838.56	55.40	644.20
Wheat	1,746.48		1,251.28	
Hay	97.28	30.00	97.28	30.00
Butter	25.36		25.36	
Cattle	41.52		41.52	
Eggs	25.28		25.28	
Horses	15.00			
Sheep	40.36		40.36	
Wool	46.56		46.56	
Corn	104.20		104.20	
Dried fruit	27.76		27.76	
Rye	.28		.28	
Flaxseed	24.88		24.88	
Leaf tobacco	401.80		401.80	
Oats	2.68		2.68	
Sundries	8,309.56	108.56	6,225.56	55.00
Total	25,392.96	2,049.12	10,572.72	858.22

This table shows that 41½ percent of the products shipped from and to Hinton is from the section of New River now being improved; 400 tons from New River were shipped at Lowell, a station on Greenbrier River, and 87 tons sent thereto.

3015 **STATEMENT OF TONNAGE SENT FROM AND RECEIVED AT THE FOLLOWING STATIONS ON THE ATLANTIC, MISSISSIPPI AND OHIO RAILWAY FOR THE YEAR ENDING DECEMBER 31, 1880**

(Furnished by E. E. Portlock, auditor)

Name of stations	Sent	Received	General classification of tonnage sent	
			Products	Tons
	Tons	*Tons*		
Christiansburg	4,816.72	2,104.55	Of animals	8,098.57
Central	719.70	182.20	Of agriculture	4,143.79
New River	987.53	253.61	Of the forest	612.75
Dublin	3,937.31	1,326.17	Of manufactures	265.06
Martin's	5,335.00	4,508.36	Of the mines	12,704.58
Max Meadow	4,109.22	1,382.40	Of vegetables	565.11
Wytheville	2,495.31	2,415.64	Other articles	358.68
Crockett	3,822.68	604.51	Miscellaneous	1,136.89
Rural Retreat	1,661.96	552.93		
Total	27,885.43	13,330.37		27,885.43

The above is all from the two upper sections of New River now being improved, and it may be safely asserted that not less than one-third of this amount will be shipped by water as soon as the channel is made.

Of the products of the mines, which amount to 7,044 tons, exclusive of coal, seven-eighths will be carried in boats down to New River Bridge Station.

The proportion of tonnage received, that will be sent over this route, could not be ascertained.

W. P. S.

Operations were suspended at the close of October 1880, and not resumed until May, 1881. As much of the work is done by men in the water, it can only be carried on when the water is low, is clear, and not too cold.

An appropriation of $24,000 was made March 3, 1881, for the application of which a project, given below, was submitted to the Chief of Engineers April 27, 1881, and by him soon after approved. Under this and previous projects the work has been actively continued to the end of the fiscal year, and will be as long as the state of the river allows in 1881, and will be resumed as early as possible in 1882.

July 1, 1881, amount expended during fiscal year, exclusive of outstanding liabilities July 1, 1880	16,179.09
July 1, 1881, amount available	31,904.17
Amount (estimated) required for completion of existing project	181,000.00
Amount that can be profitably expended in fiscal year ending June 30, 1883	25,000.00

PROJECT OF LIEUTENANT-COLONEL WILLIAM P. CRAIGHILL, CORPS OF ENGINEERS

BALTIMORE, MD., *April 27, 1881.*

GENERAL: In accordance with your instructions I have the honor to submit below a project for the expenditure of the appropriation of March 3, 1881, for the New River in Virginia and West Virginia.

The phraseology of the appropriation is the following:

Improving New River from the Lead Mines in Wythe County, Virginia, to mouth of Greenbrier River, $24,000, of which sum $15,000 shall be expended in the continuation of the work from the mouth of Greenbrier up and $9,000 in the continuation of the work from the Lead Mines to Wythe County down.

The general plan of improvement adopted has had reference to a navigation by the boats now in use on the river. This has consisted of making a channel 2 feet deep at ordinary low-water and 18 inches deep at extreme low-water, and varying in width from 30 to 50 feet according to location and direction. In some extraordinary cases, where the channel is necessarily quite crooked, an additional width of from 25 to 50 feet has been given.

This plan involves blasting above and below water and the removal of ledges and bowlders, placing the debris in wing dams and training walls, excavating through gravel shoals and placing the material in the hearts of the dams, and thus making sluices and chutes, affording an improved waterway without too much increasing the velocity and volume of the water in them.

It is proposed to continue this method of improvement in the expenditure of the last appropriation, distributing the work as follows:

3017 1. IN THE SECTION FROM HINTON OR THE MOUTH OF THE GREENBRIER UP

To complete work already begun from the mouth of Greenbrier to Lick Creek, 20 miles in extent	$1,500
At mouth of Lick Creek	250
At Shanklin's Ferry Ledge, 20¼ miles from Hinton	250
At Shanklin's Ford Shoal, 20¾ miles from Hinton	2,150
Shoals, 21 miles above Hinton	450
Walker's Lower Shoals, 21¾ miles above Hinton	500
Walker's Upper Shoals, 22½ miles above Hinton	3,100
Pendleton's Ledge, 24 miles above Hinton	300
Pendleton's Shoals, 24 miles above Hinton	750
Round Bottom, 24½ miles above Hinton	700
Shoals, ripples, and ledges between Round Bottom and Wiley's Falls, 25 miles above Hinton	2,050
Wiley's Falls, 25½ miles above Hinton	2,500
Surveys (and estimates) of Neilly's Falls, to decide whether a sluice may be made or a lock necessary, 30 miles above Hinton	500
	15,000

2. IN THE SECTION FROM THE LEAD MINES IN WYTHE COUNTY DOWN

Nunn's Ledges, 21.6 miles above New River Bridge	$500
Ledge just below Clark's Falls	125
Clark's Falls, 22.8 miles above New River Bridge	950
Clark's Ledges, 22.9 miles above New River Bridge	550
Lake Island ledge, 23 miles above New River Bridge	625
Hollingsworth Branch ledge, 23 miles above New River Bridge	100
Burden's Ledge, 24.8 miles above New River Bridge	200
Ledge, 25.6 miles above New River Bridge	100
Crumm's ledges and shoals, 26.6 miles above New River Bridge	1,300
Howard's ledges, 26.9 miles above New River Bridge	250
Pine Run Shoals and Rapids, 27.7 miles above New River Bridge	3,500
Ledge, 31.5 miles above New River Bridge	150
Sawyer's Shoals, 32 miles above New River Bridge	150
Survey of Foster's Falls, 37 miles above the bridge, to locate locks and dams (these falls are 18 feet in height)	500
	9,000

The foregoing distribution is necessarily approximate, but is as near as can be made until the work is actually in hand, which is very irregular in character, and such that accurate estimates and specifications of the details in extent and kind cannot be given. This irregularity has led to the rejection of the contract system on this river up to this time, and to the adoption of the method of procuring materials, boats, and machinery, and labor by open purchase and hire when needed.

It is recommended that this latter method be continued as most economical and satisfactory. It is not expected to expend more than $15,000 of the appropriation in 1881, but to carry the operations over to the end of the fiscal year terminating June 30, 1882.

Very respectfully, your obedient servant,

WM. P. CRAIGHILL,
Lieutenant-Colonel of Engineers.

Brig. Gen. H. G. WRIGHT,
Chief of Engineers, U. S. A.

3018 *Government exhibit 38*

REPORT OF THE CHIEF OF ENGINEERS, YEAR 1882

(pp. 140–142; 912–919)

23. New River, from the mouth of Wilson, in Grayson County, Virginia, to mouth of Greenbrier, in West Virginia.—From the mouth of Wilson, in Grayson County, Virginia, to steamboat landing at Hinton, Summers County, West Virginia, 1½ miles below the mouth of Greenbrier River, is 191½ miles.

The appropriations have been made in such a manner as to divide this portion of the river into three sections, as follows:

	Miles
Upper or Lead Mines	62
Middle or New River Bridge	43
Lower or Greenbrier	86½

Throughout this distance the navigable channel originally consisted of natural chutes, through the ledges and shoals, of varying widths, rarely over 1 foot in depth, in some places so tortuous as to render navigation extremely difficult and dangerous.

The original project adopted for the improvement of these natural channels was to widen them to 30 or 50 feet, as might be required, and deepen them to 2 feet, and straighten such as needed it. This was for keel-boat navigation, the improvement, however, to be made in such a manner as to aid the work should a greater depth and width be required in the future.

A small steamboat, draught 12 inches, when light, having been built at Hinton in the fall of 1878, rendered it necessary to make the channel, in that section, 50 feet wide at all points, and in many from 75 feet to 100 feet, the depth of 2 feet being retained. This steamboat was not adapted in dimensions and power to the navigation of the river, and has been withdrawn.

The original plan of improvement has been adhered to, except
that the width of channels on the middle and upper divisions has
been reduced to 20 feet, and on the former to 10 feet for
3019 7½ miles, to allow iron to be shipped from the furnaces
above.

June 30, 1881, there was a channel from Hinton to Harvey's Ledge, 17½ miles, 50 feet wide and 2 feet deep; at the close of the work in 1881, this channel had reached a point 26½ miles above Hinton.

At the end of the same fiscal year there was a channel from New River Bridge to Peak's Creek, 12 miles, 2 feet deep and 30 feet wide; at the close of the season this was extended to a point 22 miles above New River Bridge.

At the end of the same fiscal year there was nothing done above the Lead Mines, but at the close of the working season of 1881 a channel 2 feet deep and 20 feet wide was made to a point 5⅓ miles above the mines.

Below is shown the miles of river improved from the commencement of the work to close of 1881, since which time little has been done up to June 30, 1882, on account of high river and coldness of the water in which the men must stand to work:

	1881	Previous	Total
	Miles	*Miles*	*Miles*
Greenbrier division	9	17½	26½
New River Bridge division	10	12	22
Lead Mines division	5⅓		5⅓
Total	24⅓	29½	53⅚

On the lower division there are 13 keel-boats and a small side-wheel steamboat, 75 feet long, 10 feet wide, and 3 feet deep, with another 100 feet long and 15 feet wide being built. Four of the keel-boats run up to Shumate's Falls, 28 miles, carrying supplies to the New and East River railroads.

On the middle division there are eight keel-boats, and parties are about to build a small tug-boat and a light draught steamboat to carry ores down to New River Bridge. On the upper division there are no boats, as the improvement is not yet carried far enough.

The tables attached to the report of the superintending engineer show that of the freight shipped from the stations on 3020 the Chesapeake and Ohio Railway, which are outlets to the river on the lower division, 70 per cent. is from New River, an increase over 1880 of 36½ per cent. The shipments from the various stations on the Norfolk and Western Railroad show an increase of 33 per cent. over last year. The navigation of the river not being continuous as yet, it is practically a feeder to the several railroads which cross it and run along portions of it. It has also been of much use in carrying materials and supplies to the railroads while in process of construction near it. While the freighting on the river has increased, the excessive drought of 1881 diminished greatly the amounts of agricultural products to be carried. It is probable that when the river is fully improved boats will transport one third of all such products and seven-eighths of those of the mines, exclusive of coal.

Operations had been suspended in July for want of funds, but were resumed about the middle of August on the portions of the river within reach of the Chesapeake and Ohio and the Norfolk and Western railroads. The upper section of the river, above the Lead Mines, in Wythe County, being separated from the remainder of the river by Foster's Falls, which are not passable, it has not been deemed expedient to expend the money applicable thereto at this time.

July 1, 1881, amount available	$31, 904. 17
July 1, 1882, amount expended during fiscal year, exclusive of outstanding liabilities July 1, 1881	28, 398. 07
July 1, 1882, amount available	3, 506. 10
Amount appropriated by act passed August 2, 1882	12, 000. 00
Amount available for fiscal year ending June 30, 1883	15, 506. 10
Amount (estimated) required for completion of existing project	169, 000. 00
Amount that can be profitably expended in fiscal year ending June 30, 1884	30, 000. 00

G 23

IMPROVEMENT OF NEW RIVER FROM THE MOUTH OF WILSON, IN GRAYSON COUNTY, VIRGINIA, TO THE MOUTH OF THE GREENBRIER RIVER, IN WEST VIRGINIA

The operations on this river in 1881 were begun June 1 and ceased October, 1881. A detailed account of them is given in the following report of Col. W. P. Smith, assistant engineer:

BALTIMORE, MD., *April 28, 1882.*

COLONEL: I have the honor to submit the following 3021 report of operations on the improvement of New River, Virginia and West Virginia, for the season of 1881.

GREENBRIER DIVISION

Work was begun June 1 and stopped October 31, only losing eight and one-half out of one hundred and thirty-one working days. The surveys and storing were finished December 24. Three parties worked on the new improvement and a smaller one was kept occupied in strengthening the wall at Indian Creek, straightening the channel at Garten's Ledges, and deepening the waterway at other points, rendered necessary by the prevailing low-water.

Average number of men employed, 57; highest water, 10 feet above and lowest 1 foot below zero. The new work covers a river space, with a channel 50 feet wide and 2 feet deep, of 9 miles, fall in the same 40.55 feet, passing through 17 distinct shoals, falls, and series of ledges, reaching to a point 26½ miles above Hinton, with a total fall in that distance of 102.65 feet.

The wing-dams and training walls built this season, if united would make a wall 1⅓ miles long, 9 feet wide, and 3 feet high. In addition to the above, 800 cubic yards of material were placed in the old walls. Actual cutting through ledges, 6,890 feet for the season.

As yet there is only a narrow channel through Wiley's Falls. The extreme low-water affected the cost of this work less than on either of the other divisions, but still it was somewhat more expensive, as the estimates were made for the work with a depth of water nearly 6 inches greater than it proved to be.

Bateaux navigated the stream throughout the summer, carrying their usual loads of about 6 tons, which would have been impossible without the improvement.

The work is now in Virginia, but as only a small point of that State puts in here, the work will essentially be for the benefit of West Virginia, as the counties of Monroe and Mercer in the latter State will supply all of the freight, until the improvement reaches the Narrows, 40 miles above Hinton.

3022 The rock encountered was almost entirely a hard sandstone, with more gravel than has been met with heretofore.

A survey of Shumate's Falls in this division, 28 miles above Hinton, was made in July and August, and a map of the same on a scale of 100 feet to the inch, from an examination of which it is found that a channel can be cut through a point of land that puts in at the falls, and obviate the necessity of a lock and dam. At the point, the cutting will be 300 feet long, 55 feet wide at top and 45 feet at bottom, with an average depth of 6 feet. Above this the channel will be cut through the ledges in the river, and below a crib-work—10 feet wide at bottom, 6 feet at top, and 6 feet deep—400 feet long, will be used to hold up the water. Total length of channel 2,400 feet, with a fall in the same of 10.9 feet, or 0.45 of a foot in 100 feet. This work can be done for $9,000 in round numbers, and the grade is much less than in some other "chutes" through which boats now run successfully. A lock and dam of suitable dimensions for this sort of navigation, at this point, would cost $26,000.

In March, 1882, a careful survey of the shores on the left bank of the river was made at Crump's Ledges, Indian Creek, Crockett's, Warford, and Tom's Run Shoals, to ascertain how much the banks were injured by high-water, and to what extent, if any, this injury was attributable to the improvement.

Seventy-eight per cent. of the freight sent from Hinton came from that portion of New River now being improved; an increase of 36½ per cent. over 1880. Forty-nine per cent. of the freight sent from Lowell came from New River, and 25 per cent. of that received was sent thereto.

NEW RIVER BRIDGE DIVISION

Work was begun June 7 and carried on until October 30, making one hundred and fifteen days out of a possible one hundred and twenty-three. Surveys and storing were finished November 20.

This force was divided into three parties, averaging about twenty men each. Total average, fifty-four. Considerable 3023 difficulty was experienced in getting laborers that would stay on the work; so many railroads and furnaces were being built that the men were constantly going and coming, much to the detriment of the work.

The extreme low-water, this season, increased the amount of work at the points cut through at least fourfold; hundreds of feet had to be taken out, which, with the water 6 inches higher, would not have had to be touched.

The rock encountered was limestone, with ledges nearly vertical; but little gravel.

Highest water 8½ feet above and lowest .92 foot below zero.

The work covers a river space of 10 miles; fall in the same 74.03 feet, passing through nine shoals, falls, and ledges, reaching to a point 22 miles above New River Bridge, with a total fall, in that distance, of 109.38 feet. Actual cutting through the ledges, 8,040 feet for the season. Linear length of walls, 9 feet wide and 3 feet high, 1 mile. Channel from New River Bridge to Peak's Creek, 12 miles and 30 feet wide; from Peak's Creek to Cecil's Ledges, 2½ miles, 20-feet wide, and from Cecil's Ledges to Nunn's Ledges, 7½ miles, 10 feet wide, with a 20-foot channel in the two large ledges of Runyan's Shoals; the channel at all points being 2 feet deep at zero, or ordinary low water.

The 10 foot channel was adopted in order that iron might be shipped from the furnaces, which is now being done from Little Reed Island with 6 batteaux, which carry half loads from the furnace to the head of the improvement, and thence full loads, of from 5½ to 6 tons, to New River Bridge. This 10-foot channel will be widened to 20 feet just as soon as obstructions are removed sufficiently to accommodate the furnaces. Ten-foot channels are not wide enough, as the current is too rapid for the boats in use.

Breeden's Ledges, nearly 25 miles above the initial point, were improved for the shipment of iron ore from the mines to Radford Furnace.

A crane boat and two batteaux were built this season, the former at a cost of $496 and the latter $110 each.

3024 A survey of Foster's Falls, 37 miles above New River Bridge, was made in August and September and mapped, from which it was ascertained that 2 locks of 9 feet lift will have to be built to get around them, together with 1,400 feet of canal 20 feet wide and 4 feet deep. The canal or race belonging to the Pierce Furnace Company can be used for that purpose by deepening it 2 feet, or what will, perhaps, be better, raising the dam at the head of the shoals 2 feet, which will cost about the same. These locks will be at the extreme lower end of the falls, and only far enough apart to allow the length of a boat between. They are to be 110 feet long and 20 feet wide, with 4 feet on the miter sills.

2 locks at $8,000	$16,000
850 cubic yards rock cutting, at $2	1,700
5,500 cubic yards earth cutting, at 25 cents	1,375
10 per cent. for contingencies	1,907
10 per cent. for contingencies	1,907
Total	$20,982

These falls are 1,850 feet long, with a fall of 18.2 feet—about 1 foot in 100 feet—and are divided into three sections, as follows:

Lower, 250 feet long; fall 4.3 feet.
Middle, 400 feet long; fall, 5.0 feet.
Upper, 300 feet long; fall, 5.0 feet.

To show that the attention of capitalists has been called to this part of the river, it may be well to state that two parties wish, the one to put on a small tug-boat and the other a light-draught steamboat, to carry ores from the mines down to projected smelting furnaces at New River Bridge, on the Norfolk and Western Railroad.

LEAD MINES DIVISION

Work commenced June 14 and stopped September 30; ninety working days, out of which eight were lost. Surveys finished and camp struck October 25. Only one party on this Division, averaging about twenty men, for the season. Highest water 5 feet above, and lowest .88 foot below zero, or ordinary summer water.

This work covers a river space of 5½ miles from the Lead Mines to Wilkinson's Forge, passing through eight shoals
3025 and ledges, with a fall of 49.26 feet in that distance. Actual cutting through ledges, 2,976 feet for the season.

The same difficulties attending the work on the middle division, with regard to labor and low-water, were experienced here. The work stops almost in the middle of Wilkinson's Shoals, which are 1¾ miles long, and until they can be finished the improvement amounts to nothing; in fact, to be useful for the shipment of timber and charcoal, it should be carried at least 4 miles farther, to Crooked Creek.

The rock encountered was limestone, dolomite, sandstone, red and blue shale, river rock, and bowlders.

A crane boat and batteau were built here, at a slightly increased cost over those on the middle division, arising from the fact that the material had to be carried farther.

Cost of solid rock and bowlders on the entire work, $1.87½ per cubic yard; cost of gravel, $1.04. Price of labor, 10 cents per hour up to the middle of September, when it was increased to 12½ cents per hour.

Reference is made to the accompanying tables for details of the work for the season, as well as for commercial statistics with regard to shipments to and from the various railroad stations to which this river is tributary.

Maps on a scale of 100 feet to the inch have been made of twenty-six shoals worked at this season, on the lower and middle divisions, comprised in eleven sheets, and eight shoals on the upper division, on a scale of 800 feet to the inch, in one sheet. Shumate's and Foster's Falls were made on the larger scale mentioned above; also three sheets of gauge readings on each of the divisions. Three tracings, on a scale of 800 feet to the inch, showing the portions of the river improved in 1881, with appropriate references to detail drawings, are herewith transmitted.

J. F. Palmer, R. Hurley, and J. A. Welch are entitled to much credit for zeal and energy displayed as superintendents of the lower, middle, and upper divisions.

3026 The original plan of improvement has been adhered to, except that the width of channels on the middle and upper divisions has been reduced to 20 feet, and on the former to 10 feet, for 7½ miles, to allow iron to be shipped from the furnaces above.

June 30, 1881, there was a channel from Hinton to Harvey's Ledge, 17½ miles, 50 feet wide and 2 feet deep; at the close of the work in 1881, this channel had reached a point 26½ miles above Hinton. At the end of the same fiscal year there was a channel from New River Bridge to Peak's Creek, 12 miles, 2 feet deep and 30 feet wide; at the close of the season this was extended to a point 22 miles above New River Bridge. At the end of the same fiscal year there was nothing done above the lead mines, but at the close of the working season of 1881 a channel 2 feet deep and 20 feet wide was made to a point 5⅓ miles above the mines.

Below is shown the miles of river improved from the commencement of the work to close of 1881:

	1881	Previous	Total
Greenbrier division	9	17½	26½
New River Bridge division	10	12	22
Lead mines division	5⅓	0	5⅓
Total	24⅓	29½	53⅚

On the lower division there are thirteen keel-boats and a small side-wheel steamboat, 75 feet long, 10 feet wide, and 3 feet deep, with another 100 feet long and 15 feet wide being built. Four of the keel-boats run up to Shumate's Falls, 28 miles, carrying supplies to the New and East River Railroads.

On the middle division there are eight keel-boats, and parties are about to build a small tug-boat and a light-draught steamboat to carry ores down to New River Bridge.

On the upper division there are no boats, as the improvement is not yet carried far enough.

3027 The tables following show that of the freight shipped from the stations on the Chesapeake and Ohio Railway, which are outlets to the river on the lower division, 70 per cent. is from New River, an increase over 1880 of 36½ per cent.

The shipments from the various stations on the Norfolk and Western Railroad show an increase of 33 per cent. The shipments by river to New River Bridge Station began too late in December for any freight to be sent by rail.

The foregoing shows an increase of freight exceedingly good, considering the drought that prevailed throughout the entire river country.

TABLE NO. 1.—SHOWING THE DISTANCES FROM STEAMBOAT LANDING AT HINTON, W. VA., TO FOOT OF SHOALS OR LEDGES, THEIR LENGTH AND DIFFERENCE OF LEVEL BETWEEN THE HEAD AND FOOT OF SAME; ALSO THE QUANTITY AND QUALITY OF MATERIAL EXCAVATED IN MAKING AND IMPROVING THE CHANNEL IN 1881

TABLE No. 6.—STATEMENT OF TONNAGE SENT FROM THE FOLLOWING STATIONS ON THE NORFOLK AND WESTERN RAILROAD DURING THE YEAR ENDING DECEMBER 31, 1881

(Furnished by E. E. Portlock, auditor)

[In tons of 2,000 pounds each]

Name of station	Tons	General classification of tonnage	
		Products	Ton
Christianburg	6,839.42	Of animals	10,904.33
Central	1,483.57	Of agriculture	3,042.68
New River	1,058.86	Of the forest	2,601.54
Dublin	5,993.79	Of manufacture	426.56
Martin's	8,098.19	Of the mines	22,515.28
3030 Max Meadow	7,078.00	Of vegetables	1,135.59
Wytheville	2,972.72	Of other articles	79.64
Crockett's	5,443.24	Miscellaneous	857.47
Rural Retreat	2,505.29		
Total	41,563.09		41,563.09

All of the above is from the Upper New River sections, now being improved. Shipments of iron by river only commenced in December 1881, and are not shown. When the river is fully improved it is thought that boats will carry one-third of all the products and seven-eighths of those of the mines, exclusive of coal. The tonnage from these stations is one-third more than in 1880.

Respectfully submitted.

WILLIAM PROCTOR SMITH,
Assistant Engineer.

Lieut. Col. WILLIAM P. CRAIGHILL,
United States Engineers.

Operations were resumed as early as possible in the spring of 1882. The two causes of delay are usually a high stage of the river and the temperature, as much of the work must necessarily be done by men standing in the water.

GREENBRIER DIVISION

Preparations for work were begun the 1st of May, by building a small bateau, gunwales 36 feet, width 6 feet, and depth 2½ feet, repairing the other bateaux and jolly boats, and making a careful survey of the bank of the river on the side of the chute at Wiley's Falls, 26 miles above Hinton, where camp is established.

Preparations were completed June 1. These falls are 3½ feet high, consisting of two well-defined and several broken ledges of peculiarly hard sand rock. Some work was done here last season, but not sufficient to permit the passage of bateaux at ordinary, much less extreme low water. Although the river continued very

muddy, and never fell lower than 0.4 degree above zero, a channel 120 feet long, from 10 feet to 15 feet wide, and 2 feet deep,
3031 was cut through the falls, and several large bowlders removed from between the ledges, occupying ten men fifteen days.

The bateaux, of which there are five, carrying supplies to the East River Railroad to Shumate's Falls, 30 miles above Hinton, now get through quite easily, with fair loads, but the channel must be widened to decrease the velocity of the current, and deepened for extreme low-water. Five bateaux run to Lick Creek from Hinton, and four are carrying stores and other products, making fourteen on the river.

NEW RIVER BRIDGE DIVISION

Camp was established May 10, and the time until June 8 occupied in repairing boats and making other necessary preparations for the work. Fifteen days with one party of twenty men were occupied at the following points:

Head of Jones's Ford Shoals, 20.9 miles from New River Bridge, a channel was made 210 feet long, three-fourths of it through solid and the balance through loose rock.

Nunn's Ledges, 21.6 miles above the bridge, a channel was made through five solid ledges, from 25 to 30 feet wide.

Clark's Falls, 22.8 miles from the bridge; solid rock cutting 20 feet wide; fall 2½ feet.

Clark's Ledges, 200 feet above the falls; channel made through the lower one, 60 feet thick.

Total channel way, 415 feet long, 10 feet wide, and 2 feet deep, the cutting averaging 1 foot, covering a river space of 2 miles, and giving navigation for bateaux nearly 23 miles above New River Bridge. Character of rock, limestone and red shale.

This work was done in the two middle weeks of the month, with the water somewhat muddy and a few tenths of a foot above zero or ordinary low-water; the balance of the month it rained nearly every day, keeping the river very muddy and too high for anything to be done, Gauge readings varied from 1 foot above down to zero.

The channel made this season is of great assistance to the bateaux carrying iron to the Norfolk and Western Railroad,
3032 otherwise the work would not have been done under the adverse circumstances mentioned above.

Four boats are being used to carry iron from Boone, and the same number from Radford Furnace.

LEAD MINES DIVISION

Nothing done. Funds exhausted.

Labor on the river up to this time has been obtained for 10 cents an hour, but owing to the high price of provisions it is thought that 11 or 12 cents will have to be paid in the future.

Could it have been anticipated that May and June would have been so unfavorable, preparations for work would not have been made so early. Last year these months were as good as any throughout the season.

MONEY STATEMENT

July 1, 1881, amount available	$31,904.17
July 1, 1882, amount expended during fiscal year, exclusive of outstanding liabilities July 1, 1881	28,398.07

3033 *Government exhibit 39*

REPORT OF THE CHIEF OF ENGINEERS, YEAR 1883

(pp. 144–145; 699–705)

23. New River, from the mouth of Wilson, in Grayson County, Virginia, to the mouth of Greenbrier River, in West Virginia.—As has been stated in previous reports, but is here repeated to save trouble in referring to other volumes, the appropriations have been made in such a manner as to divide this portion of the river into three sections, as follows:

	Miles
Upper or Lead mines	62
Middle or New River Bridge	43
Lower or Greenbrier	86½

Throughout this distance the navigable channel originally consisted of natural chutes, through the ledges and shoals, of varying widths, rarely over 1 foot in depth, in some places so tortuous as to render navigation extremely difficult and dangerous.

The original project adopted for the improvement of these natural channels was to widen them to 30 or 50 feet, as might be required, deepen them to 2 feet, and straighten such as needed it. This was for bateau navigation, the improvement, however, to be made in such a manner as to aid the work should a greater depth and width be required in the future.

A small steamboat, draught 12 inches, when light, having been built at Hinton in the fall of 1878, rendered it necessary to make the channel in that section, 50 feet wide at all points, and in many from 75 feet to 100 feet, the depth of 2 feet being retained. This steamboat was not adapted in dimensions and power to the navigation of the river, and has been withdrawn.

The original plan of improvement has been adhered to, except that the width of channels on the middle and upper divisions has been reduced to 20 feet, and on the former to 10 feet for several miles, to allow iron to be shipped from the furnaces above.

3034 Most of the work of 1882, on the Greenbrier Division, was done at Wiley's Falls, in reducing the grade from 1.95 feet in 100 to 72. The length of navigable channel above Hinton on this division is the same, 26½ miles, as reported a year ago, but it has been much improved.

June 30, 1882, there was a channel from New River Bridge to the head of Jones' Ford, a distance of 22 miles, 2 feet deep, 30 feet wide for 12 miles, 20 feet wide for 2½ miles, and 10 feet wide for 7½ miles. During the season of 1882 this channel was extended through 7¼ miles, with a width of 10 feet and a depth of 2 feet to a point 29¼ miles above the bridge.

Nothing was done during the fiscal year on the Lead Mines Division, as it is separated from the remainder of the river by Foster's Falls, which are not passable.

Nothing was done in 1883 before the end of the fiscal year on the whole river. When work ceased in October, 1882, the property pertaining to each division was placed in store, as usual, in charge of a watchman. The assistant engineer was then brought to Baltimore and employed in preparing his report of past work, making drawings showing the condition of the river at the close of the operations of the season, and the progress of the improvement, with estimates of the cost of what yet remains to be done for its completion.

When Congress adjourned March 3, 1883, without provision for further work, it was deemed best and most economical, instead of keeping the property in store at considerable expense for a long time, to collect it at some convenient place and dispose of it. Hinton was the point selected. The day of sale was April 25, 1883, and the amount realized $415.16, which was turned into the Treasury in conformity to law. The assistant engineer was, with regret discharged at the end of May. His services have been of much value.

It has hardly been practicable to accomplish at any one of the very many points needing improvement all that has been desirable, but the worst places have been worked upon to the greatest extent and efforts thus been made to increase the available navi-
3035 gability of the river over as long stretches as possible, and
to increase the facilities for access of the greatest number to the railroads touching the river, and thus connecting with the eastern and western markets districts otherwise much isolated and hitherto dependent on teaming to railroad stations over long and bad roads.

Should work be resumed, it will be found difficult to collect and organize as efficient a force as that which has been disbanded and necessarily scattered. To replace such a machine takes time and money.

The number of large boats on the river for carrying freight has increased to twenty-five. The following important facts are taken from the report of the superintending engineer:

Of the freight sent from Hinton in 1882, 95 per cent. came from New River, an increase over 1881 of 46 per cent.

Of the freight received at Hinton in 1882, 43 per cent. went up the river; 24½ per cent. increase on shipments from Hinton in 1882 over 1881; 9 per cent. increase on freight received at Hinton in 1882 over 1881.

In the same order as above, the percentages at Lowell and Hinton Stations, Chesapeake and Ohio Railway combined, were respectively 92½, 46, 14, and 55.

The shipments from the various stations on the Norfolk and Western Railroad, tributary to the river, were not received from the auditor, owing to want of time to prepare them, which is much to be regretted, as it is desirable to have comparisons annually.

The navigation of the river not being continuous as yet, it is practically a feeder to the railroads which cross it and run along portions of it. It has also been of much use in carrying materials and supplies to the railroads while in process of construction near it. It is probable that when the river is fully improved boats will transport one-third of the products of the fine agricultural country through which it flows, and seven-eighths of those of the mines, exclusive of coal.

July 1, 1882, amount available	$3,506.10
Amount appropriated by act passed August 2, 1882	12,000.00
	15,506.10
July 1, 1883, amount expended during fiscal year exclusive of outstanding liabilities July 1, 1882	12,419.44

Amount that can be profitably expended in fiscal year ending June 30, 1885	50,000,00

H 23

IMPROVEMENT OF NEW RIVER FROM THE MOUTH OF WILSON, IN GRAYSON COUNTY, VIRGINIA, TO THE MOUTH OF THE GREENBRIER RIVER, IN WEST VIRGINIA

The operations on this river in 1882 began in June and ended in October. A detailed account of them is given in the appended report of Col. William Proctor Smith, assistant engineer.

When work on the river ceased in October, 1882, the property pertaining to each division was placed in store, as usual, in charge of a watchman. The assistant engineer was then brought to Baltimore and employed in preparing his report of past work, making drawings showing the condition of the river at the close of the operations of the season and the progress of the improvement, with estimates of the cost of what yet remains to be done for its completion.

When Congress adjourned, March 3, 1883, without provision for work in 1883, it was deemed best and most economical, instead of keeping the property in store at considerable expense for a long time, to collect it at some convenient place and dispose of it. Hinton was the point selected. The day of sale was April 25, 1883, and the amount realized $415.26, which was turned into the Treasury, in conformity to law. The assistant engineer was, with regret, discharged at the end of May. His services have been of much value.

It has hardly been practicable to accomplish at any one of the very many points needing improvement all that has been desirable, but the worst places have been worked upon to the greatest extent, and efforts thus been made to increase the available navigability of the river over as long stretches as possible, and to increase the facilities for access of the greatest number to the railroads touching the river, and thus connecting with the eastern and western markets districts otherwise much isolated and hitherto dependent on teaming to railroad stations over long and bad roads.

3037 Should work be resumed, it will be found difficult to collect and organize as efficient a force as that which has been disbanded and necessarily scattered. To replace such a machine takes time and money.

The statements and statistics in Colonel Smith's report below indicate the value of what has been accomplished. Of the available balance of funds almost the whole pertains to the Lead Mines division, on which it has not been expedient to work during the fiscal year.

REPORT OF COLONEL WILLIAM PROCTOR SMITH, ASSISTANT ENGINEER

BALTIMORE, MD., *May 21, 1883.*

COLONEL: I have the honor to submit the following report of operations on the improvement of New River, Virginia and West Virginia, for the fiscal year ending June 30, 1883.

GREENBRIER DIVISION

Work began June 20, 1882, and ended October 31. Out of one hundred and fifteen working days, fifty-one were lost, nineteen from want of funds in July and August, and the remainder from high and muddy water. The surveys and storing were finished late in December. Only one party, of about thirteen men, was employed. Highest water 11.8 feet above, and lowest 0.2 foot below, zero. Nine-tenths of the time the gauge readings were above ordinary low water. Four distinct rises occurred, delaying operations very much. The greater part of the labor was expended on Wiley's Falls, which consisted in making a cut through hard sandstone, interspersed with iron pyrites, 184 feet long, 50 feet wide, and 3 feet deep, with a fall of 3.58 feet. 3038 Originally the grade was 1.95 feet in 100 feet, but is now reduced to 0.72 foot, obtained by deepening the channel and extending the wall, on the river side, made from the material excavated, to a length of 495 feet, 13 feet wide, and 4 feet high, with another on the land side 274 feet long, of the same width and depth as the former.

The work at Kidwell's Ripple and Wiley's Shoals was, for the most part, done with the crane-boat.

Total length of walls 1,141 feet, 12 feet wide and 3½ feet high. River space worked over 1½ miles, fall in the same 5.83 feet, giving a channel from Hinton to Wiley's Shoals, 26½ miles, 50 feet wide and 2 feet deep; total fall in the entire distance, 104.26 feet, and fall over ledges and shoals 91.98 feet. Actual cutting through ledges, 47.875 feet.

The project for the season called for some work at Warford Shoals and Indian Creek, but as it was found that boats could get through these places very well, and that the work would not be injured by letting them alone, and Wiley's Falls being considered more important, the money was expended there, and, as the work was greater than anticipated in the project, there was no money left for the few shoals above that were estimated for this season.

Whilst the men in bad weather could not work, the boat's crew and some other labor was used in making a more careful survey of the line of the proposed channel through Shumate's Falls, as well as to sink test pits to ascertain the quality of the material to be taken out. This work was done to employ the party and to anticipate a call for a project for the improvement of these falls before the weather would be suitable to make the necessary examinations. A map on a scale of 100 feet to the inch has been prepared, together with a profile of the channel, from which a revised estimate has been made, giving the total cost of the work, in round numbers, at $11,000. The same method of improvement is recommended as suggested in my report for the fiscal year ending June 30, 1882.

3039 A careful survey was also made of the bank of the river at and below Wiley's Falls, with cross-sections every 50 feet, showing its exact condition previous to cutting the channel, to note in the future whether any damage had resulted therefrom.

On the improved part of the river, in this division, there are nine saw-mills, employing eleven keel-boats and numerous rafts, which cut in 1882, 2,000,000 feet of lumber, 1,800,000 oil barrels, and 100,000 pipe staves, besides twenty car loads of walnut and as many of locust. Their capacity is from 10,000 to 25,000 feet per day. In addition to the above there are six keel-boats on this section of the river, making seventeen in all.

Round Bottom or Pennington's Ferry, 24½ miles above Hinton, is becoming an important place, as the most of the tobacco, grain, &c., from that part of Mercer County is being shipped from that point.

The stave business is following the improvement very closely; a bucking machine is now in operation just below Round Bottom.

The improvement, when it reaches a point 35 miles above Hinton, will give outlet to Peterstown, Monroe County, West Virginia, a thriving place, about 2½ miles from the river, at which there are three mills with a capacity of 58 barrels of flour and one hundred and twenty bushels of meal per day, three tanneries using 1,500 hides per annum, three stores, one saw-mill, and one cabinet shop.

NEW RIVER BRIDGE DIVISION

Work commenced June 8 and ended September 25; only worked forty days out of a possible ninety-eight. Bad weather, high and muddy water, and lack of funds account for the loss of time. One party of about fifteen men, with one overseer for the whole work, was employed. Highest water 7.4 feet above and lowest 0.25 foot below zero. The gauge reading was below zero for only twenty-three days during the season. Worked over a river space of 8 miles, with a fall over shoals and ledges of 36.37 feet, from the head of Jones' Ford to a point in Pine Run Shoals, 1⅛ miles from their foot, one-third of a mile from their head, and, 29¼ miles from New River Bridge, with a channel 10 feet wide and 2 feet deep. To finish Pine Run Shoals will require cutting through four ledges, about 15 feet wide, and give outlet to Barren Spring Furnace, 30.9 miles above the bridge.
3040 Character of rock, limestone and red shale.

The channel gives outlet to Reed Island Creek Furnace at the mouth of Big Reed Island Creek, 26¾ miles above the initial point. In the 8 miles referred to seventy-three ledges were encountered, twenty-seven of which were improved for the 10-foot channel, and nearly all will have to be worked at when the 20-foot channel is made, which should be as soon as Barren Spring Furnace is reached; to do this, it is thought it will be best to go back to the beginning of the 10-foot channel, at the foot of Cecil's Ledges, 14½ miles above the bridge. The increased width is rendered necessary in some places where there is loose rock and gravel, as 10 feet is not wide enough for the current to keep the channel clear; as, for instance, at Jones' Ford and Crumm's Shoals; in fact, the narrow channel was only adopted to give temporary relief to the furnaces.

Total fall from the head of Pine Run Shoals to New River Bridge, 143 feet; fall over shoals and ledges in that distance 129.89 feet; length of walls, 874 feet, 5 feet wide and 2½ feet high.

Owing to the long distance worked over, the frequent removal of camp, and bad weather, the work cost about twice as much as last season.

Something over 900 tons of pig iron were shipped from Reed Island Furnace, 26¾ miles above New River Bridge, to the Norfolk and Western Railroad at the latter point, and 256 tons from Radford Furnace, 18 miles above the bridge.

Eight keel-boats on this division, with a small side-wheel steamboat, 75 feet long, 8 feet wide, and drawing 3 feet, eighteen charcoal furnaces, four forges, four zinc mines, one lead mine, and many deposits of copper await shipment by the river, and vast forests of the most valuable timber, on the upper division, are kept from market by the non-completion of this work.

LEAD MINES DIVISION

No work this season, but inspectors of the property stored at Wilkinson's Forge, Carroll County, Virginia, were made every sixty days.

An average cost of rock per cubic yard, $2.67, an increase over 1881 of 42 per cent. Cost of gravel, $1.22 per cubic yard.

3041 Taking the total number of cubic yards of material, measured in the walls, removed since the commencement of the work in 1877, and dividing it into the total amount of money expended in that time, it is found that it only cost $2.42 per cubic yard, which shows that the work has been conducted in a very economical manner.

Total number of miles of river improved, 61. The high price of supplies—bacon 20 cents and flour 5 cents per pound—made labor command 12 cents per hour to September 15, and 12½ cents thereafter.

On the 8th of March instructions were received from you to have all of the property belonging to the improvement taken to Hinton, W. Va. On the 17th of March, J. F. Palmer, to whom much praise is due for the efficient manner in which he carried on his work as superintendent last season, as well as for the energy and ability displayed in this movement, commenced that work, and after much difficulty, on account of the weather, low water, and scarcity of labor, succeeded in getting it all at the proper point on the 14th of April, and on the 25th, by your orders, a sale was held, at which everything belonging to the Government was disposed of to the highest bidder.

Of the freight sent from Hinton in 1882, 95 percent came from New River, an increase over 1881 of 46 percent.

Of the freight received at Hinton in 1882, 43 percent went up the river. Twenty-four and a half percent increase on shipments from Hinton in 1882 over 1881. Nine percent increase on freight received at Hinton in 1882 over 1881.

In the same order as above, the percentage at Lowell and Hinton stations, Chesapeake and Ohio Railway, combined, were respectively, 92½, 46, 14, and 55.

The shipments from the various stations on the Norfolk and Western Railroad, tributary to the river, were not received from the auditor, owing to want of time to prepare them, which is much to be regretted, as it is desirable to have comparisons annually.

The tables show the details of the work for the past season, as well as the commercial statistics for the lower division.

3042 Three maps, on a scale of 100 feet to the inch, show the details of the work and surveys at two shoals and two falls on the Greenbrier division, and four maps, on a scale of 200 feet to the inch, show the work at eight shoals and ledges on the Middle or New River Bridge division. The gauge readings on each division were also plotted.

From Hinton, W. Va., to mouth of Wilson Creek, Virginia, the extent of this work is 191½ miles.

Lower Division, 86½ miles; improved, 26⅕ miles.
Middle Division, 43 miles; improved, 29¼ miles.
Upper Division, 62 miles; improved, 5⅓ miles.
Total, 191½ miles; total improved, 60.78 miles.

June 30, 1882, there was a channel 50 feet wide and 2 feet deep from Hinton Landing to Kidwell's Ripple, a distance by river of 25⅑ miles; at the close of the working season for 1882, there was a channel of the same width and depth to Wiley's Shoals, a distance of 26½ miles.

June 30, 1882, there was a channel from New River Bridge to the head of Jones' Ford, a distance of 21 miles, 12 miles 30 feet, 2½ miles 20 feet, and 7½ miles 10 feet wide, and 2 feet deep. During the season for work, 1882, this channel was extended 8¼ miles, to a point above the bridge, 29¼ miles, with a width of 10 feet, and 2 feet deep. No appropriation for the year ending June 30, 1884.

The tables give an exhibit of the commerce of the river in 1882, an increase of nearly 50 percent.

On the entire river there are twenty-five keel-boats and one small side-wheel steamboat.

Respectfully submitted.

Wm. Proctor Smith,
Assistant Engineer.

Lieut. Col. **Wm. P. Craighill,**
U. S. Engineers.

3043 TABLE NO. 1.—SHOWING THE DISTANCES FROM STEAMBOAT LANDING AT HINTON, WEST VIRGINIA, TO FOOT OF SHOALS OR LEDGES, THEIR LENGTH, AND DIFFERENCE OF LEVEL BETWEEN THE HEAD AND FOOT OF SAME; ALSO THE QUANTITY AND QUALITY OF MATERIAL EXCAVATED IN MAKING AND IMPROVING THE CHANNEL IN 1882

Shoal or ledge	Distance	Length	Fall	Solid rock and bowlders	Gravel	Total
	Miles	*Feet*	*Feet*	*Cu. yds.*	*Cu. yds.*	*Cu. yds.*
Hinton to head of Pennington's Shoals	25	46,745	86.15

REPORT OF THE CHIEF OF ENGINEERS, YEAR 1884

(pp. 149; 928)

16. New River, from the mouth of Wilson, in Grayson Count Virginia, to the mouth of Greenbrier River, in West Virginia.— Nothing was done on this river in the year ending June 30, 188 and the act of July 5, 1884, contained no further appropriatio for it. The balance, $3,079.08, reported as available, pertains b special designation in the law of August 2, 1882, to the portion o the river above Foster's Falls, which are not passable. Its ex penditure has seemed of very small benefit and has not been made

MONEY STATEMENT

July 1, 1883, amount available	$3,086.6
July 1, 1884, amount expended during fiscal year, exclusive of outstanding liabilities July 1, 1883	7.5
July 1, 1884, amount available	3,079.0
Amount (estimated) required for completion of existing project	169,000.0
Amount that can be profitably expended in fiscal year ending June 30, 1886	50,000.0

I 16

IMPROVEMENT OF NEW RIVER FROM THE MOUTH OF WILSON, IN GRAYSON COUNTY, VIRGINIA, TO THE MOUTH OF THE GREENBRIER RIVE IN WEST VIRGINIA

Nothing was done on this river in the year ending June 30, 188

MONEY STATEMENT

(Same as last money statement, supra.)

3051 *Government exhibit 41*

REPORT OF THE CHIEF OF ENGINEERS, YEAR 1885

(pp. 287–288; 1859)

3. New River, from the Mouth of Wilson, in Grayson County, Virginia, to the mouth of Greenbrier River, West Virginia.—As has been stated in previous reports, but is here repeated to save trouble in referring to other volumes, the appropriations have been made in such a manner as to divide this portion of the river into three sections, as follows:

	Miles
Upper, or Lead Mines	62
Middle, or New River Bridge	43
Lower, or Greenbrier	86½

Throughout this distance the navigable channel consisted of natural chutes through the ledges and shoals of varying widths, rarely over 1 foot in depth, in some places so tortuous as to render navigation extremely difficult and dangerous.

The original project adopted for the improvement of these natural channels was to widen them to 30 or 50 feet, as might be required, deepen them to 2 feet, and straighten such as needed it. This was for bateau navigation, the improvement, however, to be made in such a manner as to aid the work should a greater depth and width be required in the future.

A small steamboat, draught 12 inches when light, having been built at Hinton in the fall of 1878, rendered it necessary to make the channel in that section 50 feet wide at all points, and in many from 75 feet to 100 feet, the depth of 2 feet being retained. This steamboat was not adapted in dimensions and power to the navigation of the river, and has been withdrawn.

The original plan of improvement has been adhered to, except that the width of channels on the middle and upper divisions has been reduced to 20 feet, and on the former to 10 feet for several miles, to allow iron to be shipped from the furnaces above.

Nothing was done in the year ending June 30, 1884, nor in the year ending June 30, 1885, and the act of July 5, 1884, contained no further appropriation; neither was there an appropriation at the session of 1884–'85. The balance available, $3,000, pertains, by special designation of the law of August 2, 1882, to the portion of the river above Foster's Falls, which are not passable. 3052

Though some anxiety has been manifested by the people interested in that section of the river for the expenditure of this balance, it remains in the Treasury, as the need of it was not apparent until Foster's Falls could be passed. The difficulty about these falls will, however, considerably disappear when the railroad up Cripple Creek is completed, as boats could then ship to the railroad their freight at Porter's Ferry, above the Lead Mines and the falls.

The navigation of the river not being continuous as yet, it is practically a feeder to the railroads which cross it and run along portions of it. It has also been of much use in carrying materials and supplies to the railroads while in process of construction near it. It is probable that when the river is fully improved boats will transport one-third of the products of the fine agricultural country through which it flows, and seven-eighths of those of the mines, exclusive of coal.

MONEY STATEMENT

July 1, 1884, amount available	$3,079.08
July 1, 1885, amount expended during fiscal year, exclusive of outstanding liabilities July 1, 1884	79.08
July 1, 1885, amount available	3,000.00
Amount (estimated) required for completion of existing project	169,000.00
Amount that can be profitably expended in fiscal year ending June 30, 1877	25,000.00

Submitted in compliance with requirements of section 2 of river and harbor acts of 1866 and 1867.

DD3

IMPROVEMENT OF NEW RIVER FROM THE MOUTH OF WILSON IN GRAYSON COUNTY, VIRGINIA, TO THE MOUTH OF THE GREENBRIER RIVER, IN WEST VIRGINIA

Nothing done on this river during the year ending June 30, 1885.

(Same as last money statement, supra.)

3053 *Government exhibit 42*

REPORT OF THE CHIEF OF ENGINEERS, YEAR 1886

(pp. 281-282; 1599-1602)

3. New River, from the mouth of Wilson, in Grayson County, Virginia, to the mouth of Greenbrier River, West Virginia.—As has been stated in previous reports, but is here repeated to save trouble in referring to other volumes, the appropriations have been made in such manner as to divide this portion of the river into three sections, as follows:

	Miles
Upper, or Lead Mines	62
Middle, or New River Bridge	43
Lower, or Greenbrier	86½

Throughout this distance the navigable channel consisted of natural chutes through the ledges and shoals of varying widths, rarely over 1 foot in depth, in some places so tortuous as to render navigation extremely difficult and dangerous.

The original project adopted for the improvement of these natural channels was to widen them to 30 or 50 feet, as might be required, deepen them to 2 feet, and straighten such as needed it. This was for bateau navigation; the improvement, however, to be made in such a manner as to aid the work should a greater depth and width be required in the future.

A small steamboat, draught 12 inches when light, having been built at Hinton in the fall of 1878, rendered it necessary to make the channel in that section 50 feet wide at all points, and in many from 75 feet to 100 feet, the depth of 2 feet being retained. This steamboat was not adapted in dimensions and power to the navigation of the river, and has been withdrawn.

The original plan of improvement has been adhered to, except that the width of channels on the middle and upper divisions has been reduced to 20 feet, and on the former to 10 feet for several miles, to allow iron to be shipped from the furnaces above.

3054 There was no appropriation for this river in 1883, 1884, or 1885. July 1, 1886, there was a balance remaining unexpended of $3,000 from the appropriation of August 2, 1882. This pertained by special designation of the law to the portion of the river above Foster's Falls, which are not passable. The balance remained unexpended because of the impassibility of these falls. As the disconnection with routes of transportation caused by these falls would practically disappear on the completion of the railroad up Cripple Creek, and as boats could then ship to the railroad their freight at Porter's Ferry, above the lead mines and the falls, it was concluded to improve the condition of Williamson's Ledges and Shoals. This work was continued as late as the season allowed, a small balance of funds being left unexpended, but not large enough to justify the resumption of operations in the summer of 1886.

The navigation of the river not being continuous as yet, it is practically a feeder to the railroads which cross it and run along portions of it. It has also been of much use in carrying materials and supplies to the railroads while in process of construction near it. It is probable that when the river is fully improved boats will transport one-third of the products of the fine agricultural country through which it flows, and seven-eighths of those of the mines, exclusive of coal.

MONEY STATEMENTS

July 1, 1885, amount available	$3,000.00
July 1, 1886, amount expended during fiscal year, exclusive of liabilities outstanding July 1, 1885	2,533.43
July 1, 1886, amount available	466.57
Amount appropriated by act approved August 5, 1886	10,000.00
Amount available for fiscal year ending June 30, 1887	10,466.57
Amount (estimated) required for completion of existing project	159,000.00
Amount that can be profitably expended in fiscal year ending June 30, 1888	20,000.00

Submitted in compliance with requirements of section 2 of river and harbor acts of 1866 and 1867.

C C 3

Improvement of New River From the Mouth of Wilson, in Grayson County, Virginia, to the Mouth of Greenbrier River, in West Virginia

3055 July 1, 1885, there was a balance remaining unexpended of $3,000 from the appropriation of August 2, 1882. This pertained by special designation of the law to the portion of the river above Foster's Falls, which are not passable. Upon application from parties interested in the navigation of the upper part of the river, in view of the expected construction of a branch railroad up Cripple Creek, which would obviate the difficulty of the impassability of Foster's Falls, and enable the freights from the river to reach the Norfolk and Western Railroad, it was decided to ameliorate the condition of the river at Wilkinson's ledges and shoals as far as the available balance would allow.

Work was commenced September 1, 1885, and continued as long as the weather would permit work in the water. The law having left to the discretion of the Secretary of War to do this work by contract or otherwise, as it might seem most economical and advantageous to the United States, it was decided, in consideration of special circumstances, to dispense with formal contracts, to hire boats and other appliances, as well as the necessary labor.

In 1881 a channel 20 feet wide and 2 feet deep at ordinary low water of summer, was made from the lead mines in Wythe County to within 1,200 feet of Williamson's old forge in Carroll County, a distance by river of over 5 miles. In the autumn of 1885 the channel was continued of the same width and depth for a distance of 1.1 miles to a point 600 feet from the pool of Fowler's Ferry.

The actual cutting amounts to 926 linear feet; the material was made into wing-dams and sustaining walls, of which the combined length was 1,863 feet, with an average width and height of 5 feet and 3 feet, though some were 20 feet wide and 6 feet high. The total material removed amounted to 1,371 cubic yards, at a cost of $1,60 a yard.

The work was prosecuted very vigorously under the immediate superintendence of Col. W. Proctor Smith, formerly of the Corps of Topographical Engineers, United States Army.

MONEY STATEMENT

(Same as last money statement, supra.)

3056 **REPORT OF COLONEL W. P. SMITH, ASSISTANT ENGINEER**

UNITED STATES ENGINEER OFFICE,
Baltimore, Md., November 30, 1885.

COLONEL: I have the honor to make the following report of operations on the improvement of New River, Virginia, during the season of 1885.

In obedience to your instructions I went to Wytheville, Va., on the 21st, and to Ivanhoe Furnace on the 22d of August; on the 24th began preparations for improving Wilkinson's ledges and shoals, 3 miles above. The preparation consisted in building rock-boats and canoes, collecting tools, blacksmith supplies, powder, lumber for shelter for men, and to build turning-dams, and getting the same to the part of the river to be improved, making and putting up water-gauges, building blacksmith shop, making an examination of the ledges, and staking out enough of the channel to begin work, which took until the end of the month.

On the 1st of September the actual work in the river commenced, and continued without interruption until the 10th of October, with the loss of only one day from bad weather. On the 12th of October a hard rain set in, which caused the river to rise 3 feet, and the weather turning cool the work was stopped.

A survey of the part of the river which had been worked over was begun on the 14th, and finished on the 17th, which ended operations for the season in the field.

Wilkinson's shoals and ledges began about 4½ miles above the lead mines, and are 1¾ miles in length. They consist of series or groupes of ledges running entirely across the river, which, owing to bends in the stream, had, at points, to be followed in their general direction north 64° east, and at others crossed diagonally and at right angles. The ledges for the most part consist of blue and red slate, the latter often interspersed with iron pyrites and flint; some of them rise 5 or 6 feet above the surface of ordinary summer water. The fall in these ledges is 54.1 feet. The total fall from Fowler's Ferry, at the head of these shoals, to the lead mines is 79.12 feet in a distance of 6¼ miles.

3057 Between the ledges referred to, a great many bowlders of hard sandstone are found, with here and there small quantities of gravel and sand and a few loose rock.

In 1881 a channel, 20 feet wide and 2 feet deep, at ordinary summer water, was made from the Lead Mines Dam in Wythe County to within 1,200 feet of Wilkinson's old forge in Carroll County, a distance by river of a little over 5 miles. This forge was swept away by the great flood of September, 1878.

On September 1 work was commenced at the point of leaving off in 1881, continuing the channel, of the same width and depth, for a distance of $1\frac{1}{11}$ miles; to the upper or summit ledge, 600 feet from the Fowler's Ferry Pool, a point it was expected to reach this season, and which would have been done had the weather continued favorable one week longer.

In making the channel spoken of, thirty-nine groups, containing one hundred and forty-three distinct ledges, from 6 inches to to 15 feet in thickness, were encountered, as well as from eighty to one hundred bowlders, which, in the absence of a crane-boat, had to be blasted and then removed, as they were too large to be removed by rolling or lifting by hand.

The actual cutting through the ledges amounts to 926 linear feet, averaging 2 feet in depth, the material from which was made into wing-dams and sustaining walls, whose combined length amounts to 1,863 feet, with an average width and height of 5 feet and 3 feet, although some of them were 20 feet wide and 6 feet high. These walls contain 1,035 cubic yards of material and 336 cubic yards wasted; making the total amount of material removed equal to 1,371 cubic yards, at a cost of $1.60 per yard, which is very cheap, and is accounted for by the means used of hiring tools from the contractors of the Cripple Creek Railroad and the New River Mineral Company at a very low rate. No estimate of the cost of loose rock, gravel, and sand was attempted, as the quantity of each was insignificant.

The heaviest work of the season was found in the last 800 feet, where the channel had to be cut through nine groups of ledges, the fall over which is 13½ feet; over some of these ledges
3058 the water was very swift, rendering it difficult to make
turning-dams stay in their places. There were also some rock encountered about half way, where, as stated before, the ledges were full of pyrites and flint, making it very hard to drill.

To complete the work to the head of the ledges, a distance of 600 feet, there will be encountered ten small ledges over which the fall is very slight, which can be taken out at an estimated cost of $300.

The work occupied thirty-four days, with an average, all told, of thirty-two men, whose wages were $1 per day of ten hours until the 17th of September, when the time was reduced to nine hours, and still further to eight hours October 4, owing to cold weather and short days. The laborers boarded themselves and were sheltered in temporary sheds, and some occupied buildings found near the work.

The gauge-readings were below zero or ordinary summer water the whole time, the lowest being 0.95 feet below and the highest 3 feet above zero, the latter occurring during the survey after the work had stopped. For about ten days the water was muddy, which retarded operations somewhat, but on the whole the stage of the river and the weather were excellent. Five hundred holes were drilled to an average depth of 2.17 feet, 724 blasts were fired with an average charge of powder of 0.8 pounds, loosening about 1.7 cubic yards of material per blast. Six hundred pounds of powder were used, contained in 1,087 cartridges 8 inches long and 1¼ inches in diameter. The powder was Hercules No. 2, containing 40 per cent of nitro-glycerine, its lack of strength causing more to be used than heretofore, but the price being about half of that formerly used compensated for the greater quantity. Five thousand feet of double tape-fuze were consumed and 1,225 linear feet of holes drilled. Charcoal was used in the blacksmith shop, at a cost of 5 cents per bushel, purchased in the immediate vicinity of the work.

The month of November was consumed in getting up material for and preparing this report, and in plotting the notes of survey and making maps therefrom. Of the latter, two were made of the upper part of Wilkinson's ledges and shoals, showing the work in detail, and of scales, respectively, 200 feet and 800
3059 feet to the inch; one of the river from the Lead Mines down
to the head of Wilkinson's Shoals, at Fowler's Ferry, on a scale of 800 feet to the inch, showing the work in general throughout that distance, a tracing of which accompanies this report.[10] A graphic description of the guage readings for the season was also made for preservation in the office.

The Cripple Creek Railroad, which is partially built, starts from Martin's (now called Pulaski) Station, on the Norfolk and Western Railway, in Pulaski County, Virginia, strikes New River about 5 miles below the mouth of Red Island Creek, crosses soon after to the right bank and follows it to Jackson's Ford, when it crosses to the left bank and runs up to Snow Hill Branch, about 2¾ miles above the Lead Mines, which it follows, crossing the divide to Cripple Creek at Brown Hill Furnace, and thence up the creek, passing Ivanhoe Furnace, belonging to the New River Mineral Company, located on Snow Hill Branch, about 200 yards from New River at Porter's Ferry. The work on this road was temporarily suspended last June, but orders have been issued for its immediate resumption.

---

[10] Tracing omitted.—W. P. C.

Whilst the work of building the Cripple Creek Railroad was going on, the owners of two saw-mills, between 8½ and 9½ miles above the Lead Mines, with a capacity of 5,000 feet per day, hauled their lumber to the head of the channel just below the Forge and then shipped it by raft to different points along the river and railroad. Another saw-mill is also in existence up Crooked Creek, 9 miles above the mines, the lumber from which will be shipped by raft as soon as the railroad work gets in full operation. There is a large quarry on the river just below Porter's Ford, the stone from which was boated down the stream, through the channel, to the railroad, and will be again when the material is needed.

The channel made this season will benefit these rafts when a rise of about 1 foot occurs, but to do much good the balance of these shoals should be removed and the work carried on through Early's, Elley's, and the Gulf Shoals to a point near Grayson Sulphur Springs between 9 and 10 miles above the mines; in fact, for shipping lumber and minerals the channel should be made as projected, to the mouth of Wilson in Grayson County, 62 miles above the Lead Mines.

Hitherto the obstruction offered to navigation by Foster's
3060 Falls, about 6 miles below the mines, almost rendered it
useless to expend the money appropriated for the division under consideration. The construction of the Cripple Creek Railroad, however, abrogates this and puts this division on a par with those of Greenbrier and New River bridge, for its objective point is a railroad as well as that of the other two, and timber and minerals can just as easily be taken to market therefrom.

No bateaux in use on this part of the river as yet, and there will not be until the channel is made up the river a sufficient distance to make their use profitable. There are, however, one-half dozen large boats for carrying stone lying idle at the quarry referred to, ready for use as soon as times get more prosperous.

As the work stood June 30, 1882, there was a navigable channel 20 feet wide and 2 feet deep at ordinary low water above the Lead Mines Dam for a distance of a little over 5 miles. At the end of this season this distance has been increased to 6¼ miles.

It is not necessary to say anything about the other two divisions of New River, as there was no work done on them, nor were the channels examined; but from inquiries it is thought that the channel-way made in former years still keeps open, and bateaux are in constant use on them, iron having been shipped to New River bridge up to the time of the suspension of the furnaces by the prevailing hard times.

It is not thought necessary to give a description of the wonderful resources of this section of country in minerals, timber, and agricultural products, for the subject is thoroughly treated in your reports to the Chief of Engineers, United States Army, to be found in the annual report of that officer as follows: 1873, Appendix T; 1875, Appendix W; 1879, Appendix F.

Respectfully submitted.

WM. PROCTOR SMITH,
Assistant Engineer.

Lieut. Col. WM. P. CRAIGHILL,
United States Engineer Corps.

3061 *Government exhibit 43*

House Executive Documents, 1st Session, 52nd Congress, 1891–1892, Vol. 3

Report of the Secretary of War, Vol. 2—1891, Engineers, Part 1

(5) New River, from the mouth of Wilson, in Grayson County, Virginia, in the mouth of Greenbrier River, West Virginia. The appropriations have been made in such manner as to divide this portion of the river into three sections as follows:

	Miles
Upper, on Lead mines	62
Middle, on New River bridge	43
Lower, on Greenbrier	86½

throughout this distance the navigable channel consisted of natural chutes through the ledges and shoals of varying widths, rarely over one foot in depth, in some places so tortuous as to render navigation extremely dangerous and difficult.

The original project adopted for the improvement of its natural channels was to widen them to thirty or fifty feet, as might be required, deepen them to two feet, and straighten such as need it. This was for bateau navigation; the improvement, however, to be made in such a manner as to aid the work should a greater depth and width be required in the future.

A small steamboat, draft twelve inches when light, having been built at Hinton in the fall of 1878, rendered it necessary to make the length in that section fifty feet wide at all points, and in many from seventy-five feet to one hundred feet, a depth of two feet being retained. This steamboat was not adapted in dimensions and power to the navigation of the river and was withdrawn.

The original plan of improvement has been adhered to, except that the width and the length of the middle and upper divisions has been reduced to twenty feet, and on the former to ten feet for several miles, to allow the iron to be shipped from the furnaces above.

There was no appropriation for this river in 1883, 1884 3062 or 1885. July 1, 1886, there was a balance remaining unexpended of $3,000 from the appropriation of August 2, 1882. This pertained by special designation of the law to the portion of the river above Foster's Falls, which was not passable. The balance remained unexpended because of the impassability of these falls. As the disconnection with routes of transportation caused by these falls would practically disappear on the completion of the railroad up Cripple Creek, and as boats would then ship to the railroad their freight at Porter Ferry, above the lead mines and fields, it was concluded to improve the condition of Williamson Ledges and Shoals. This work was continued as long as the season allowed and small balance of funds being left unexpended, but not large enough to justify the resumption of operation in the summer of 1886.

There was an appropriation of $10,000 in the law of August 5, 1886, applicable only to the portion of the river above Leadmines. When the money became available it was too late to commence operation in 1886. For more than one reason it seemed inexpedient to expend this appropriation in the year ending June 30, 1888. The portion of the river to which it is applicable is above Foster Falls, and this can only be passed by one or two locks. There are also strong reasons for doubt whether, considering the present development of that section of the country, the construction of such locks would be justified, even if the money were available. The construction of railroads near this stream had diminished very much the importance of the improvement of the portion of reconnaissance of the river and its vicinity, and it was decided to postpone the expenditure of the appropriation until the will of Congress could be further ascertained.

In the River and Harbor Act of August 11, 1888, it was, however, directed that the balance be spent in improving the river between Ivanhoe Furnace, in the Wythe County, and the mouth of Wilson Creek. Operations in accordance with these directions were therefore commenced June 9, 1889, and continued until October 10, 1889.

In 1885 there was a channel two feet deep and twenty feet wide from Ivanhoe Furnace to within six hundred feet of the head of Wilkinson Shoals and Ledges, a distance of 3.9 miles.
3063 In 1889 this channel, with the same width, and depth was extended to the lower end of the approach to the Gulf, a distance of five miles from the initial point, with four-tenths

of a mile further up the river, partially improved. There were no operations on the river in the year ending June 30, 1891, and thereafter no expenditures in that fiscal year. The balance of $2,341.79 remains from the last appropriation, which was in August 1886.

In compliance with the recommendation of the local engineer, it was decided by the Secretary of War not to expend the existing balance at present.

MONEY STATEMENT

Up to June 30, 1891, the amount expended was	$109, 733. 21
July 1, 1890, balance unexpended	$2, 341. 79
July 1, 1891, balance unexpended	2, 341. 79
Amount (estimated) required for completion of existing project	159, 000. 00

Submitted in compliance with requirements of Section 2 of River and Harbor Acts of 1886 and 1887.

115

IMPROVEMENT OF NEW RIVER, VIRGINIA AND WEST VIRGINIA

After the suspension of the operations for some years for want of funds an appropriation of $10,000. was made August 6, 1886, applicable, however, only to the portion of the river above the Lead Mines in Wythe County, Virginia.

Doubt having arisen, in view of the changed condition of affairs on and near the river, as to the propriety of expending this appropriation at once, it was decided by proper authority to defer operations until the will of Congress could be further ascertained.

In the River and Harbor Act of August 11, 1888, it was directed that the balance should be spent in improving the river between Ivanhoe Furnace in Wythe County, and the mouth of Wilson Creek. Operations in accordance with this direction were commenced in June 1889 and continued until October 10, 1889.

The work done was in the neighborhood of Ivanhoe Furn-
3064 ace, and was continued until necessarily suspended by
high water. A balance of $2,341.79 was left, which still remains. The expenditure on this river up to 1886 were highly useful, but since that time the situation has changed. In a report of April 17, 1891, given below, it was recommended that the remaining balance be not spent at present. To this the Secretary of War agreed.

MONEY STATEMENT

(Same as last money statement, supra.)

House Documents, Vol. 3, No. 2

Reports of War Department, Engineers, Pt. 1, 55th Congress, 2nd Session, 1897

Page 379

NEW RIVER, VIRGINIA AND WEST VIRGINIA

In its original condition the navigable channel consisted
natural chutes through the ledges and shoals; the chutes were
varying widths and there was rarely over one foot of water
such points.

The original project was adopted in 1875 (report printed
the Annual Report of the Chief of Engineers for 1893, pp. 84
854) and provided for improving the stream from the lead min
in Wythe County, Virginia to the mouth of Greenbrier Rive
West Virginia, by widening the channels from 30 to 50 feet,
might be required, deepening them to 2 feet and straightenin
such as needed it for bateau navigation; the improvement, hov
ever, to be made in such manner as would aid the work shoul
greater depth and width be required in the future.

The extension of the improvements from the lead mines i
Wythe County, Virginia, up to the mouth of Wilson Creek i
Grayson County, Virginia, was provided for in the act of Con
gress of June 14, 1880. (Report on pp. 113–139, part 2 of th
Annual report, of the Chief of Engineers for 1875, and repor
on pp. 538–545, part 1, of the Annual report of the Chief o
Engineers for 1879.)

The sum of $109,691.06 was expended up to June 30, 1896, fo
open river navigation.

There were no expenditures during fiscal year ending June 3
1897. The unexpended balance is, by the act of Congress o
August 5, 1886, available for expenditure between the lead mine
and Wilson Creek. As conditions have changed in late year
the future improvements of that portion of the stream has bee
reported as entirely unnecessary, and the Secretary of Wa
3066 has decided not to expend the existing balance at presen

F. F. 7

Improvements of New River, Virginia and West Virginia (this work was in the charge of Col. Peter C. Hains, Corps of Engineers, until April 30, 1897).

The charge of the improvements of the New River was transferred to me on April 30, 1897, by Col. Peter C. Haines, Corps of Engineers, in accordance with instructions in letter of the Chief of Engineers to Colonel Hains, dated April 17, 1897.

The balance unexpended was furnished by the act of Congress on August 5, 1886, with the stipulation; "continuing improvements between the lead-mines, in Wythe County, and the mouth of Wilson's Creek in Grayson County." By letter dated April 17, 1891, it was reported to the Chief of Engineers that further improvements of that portion of the stream was wholly unnecessary, on account of changed conditions in late years. The Chief of Engineers, under date of April 23, 1891, stated that the Secretary of War had decided that the unexpended balance should be withheld from expenditure until further action is taken by Congress. Nothing has, therefore, been done toward improving the stream since that time.

62D Congress, 3d Session. House of Representatives. Document No. 1410

NEW RIVER FROM RADFORD, VA., TO HINTON, W. VA.

Letter from the Secretary of War, transmitting, with a letter from the Chief of Engineers, report on examination of New River, from Radford, Va., to Hinton, W. Va. February 20, 1913.—Referred to the Committee on Rivers and Harbors and ordered to be printed, with illustration.

WAR DEPARTMENT,
Washington, February 19, 1913.

SIR: I have the honor to transmit herewith a letter from the Chief of Engineers, United States Army, dated 17th instant, together with copy of a report from Maj. F. W. Altstaetter, Corps of Engineers, dated November 21, 1912, on preliminary examination of New River, from Radford, Va., to Hinton, W. Va., made by him in compliance with the provisions of the river and harbor act approved July 25, 1912.

Very respectfully,

HENRY L. STIMSON,
Secretary of War.

The SPEAKER OF THE HOUSE OF REPRESENTATIVES.

3069

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ENGINEERS,
Washington, February 17, 1913.

From: The Chief of Engineers, United States Army.
To: The Secretary of War.
Subject: Preliminary examination of New River from Radford, Va., to Hinton, W. Va.

1. There is submitted herewith, for transmission to Congress, report dated November 21, 1912, by Maj. F. W. Altstaetter, Corps of Engineers, on preliminary examination of New River, from Radford, Va., to Hinton, W. Va., called for by the river and harbor act approved July 25, 1912.

2. New River rises in western North Carolina and flows in a general northerly direction, uniting with the Gauley River to form the Kanawha River. Hinton is located 57 miles above the mouth and Radford 84 miles farther up. The river flows through a sparsely settled, rugged mountain country. From Hinton to

the head of slackwater in the Kanawha River, a distance of 64 miles, the fall is almost 750 feet. The whole section is unfavorable for navigation and the district officer states that the river above it could not be connected with navigation in the Kanawha by the expenditure of any reasonable amount. The stretch under consideration must therefore be considered independently. From the investigation made by the district officer, it appears that there is no demand for river improvement over this section, and that an improvement of value would require the construction of locks and dams at considerable cost. He is of opinion that the river between Hinton and Radford is not worthy of improvement by the United States, and in this opinion the division engineer concurs.

3. This report has been referred, as required by law, to the Board of Engineers for Rivers and Harbors, and attention is invited to the board's accompanying report of December 23, 1912, concurring with the views of the district officer and the division engineer.

4. After due consideration of the above-mentioned reports, I concur in general with the views of the district officer, the division engineer, and the Board of Engineers for Rivers and Harbors, and therefore, in carrying out the instructions of Congress, I report that the improvement by the United States of New River, from Radford, Va., to Hinton, W. Va., in the manner apparently desired by the interests concerned as described in the reports herewith, is not deemed advisable at the present time.

W. H. BIXBY,
Chief of Engineers, U. S. Army.

3070 REPORT OF THE BOARD OF ENGINEERS FOR RIVERS AND HARBORS

(Third indorsement)

BOARD OF ENGINEERS FOR RIVERS AND HARBORS,
December 23, 1912.

THE CHIEF OF ENGINEERS, UNITED STATES ARMY:

1. Hinton is located at the confluence of New River and the Greenbrier, 57 miles above the mouth of New River and 64 miles above the head of slack-water navigation on the Kanawha River. On this reach the fall is 750 feet, and navigation is therefore impracticable. Radford is 84 miles above Hinton, the fall on this reach being 348 feet, or over 4.1 feet per mile. The upper 54 miles of this reach—Glenlyn to Radford—is paralleled for most of

the way by two railroads. From Glenlyn to Hinton, 30 miles, the fall is 128 feet. There is no railroad along the banks of this portion of the stream, but the district officer states that no part of it is more than 15 miles from a railroad.

2. There is no navigation on the reach between Radford and Glenlyn and none is demanded by those in the vicinity who were given an opportunity of expressing an interest in the subject. Some indefinite expressions of interest were shown in regard to the reach between Glenlyn and Hinton, but these were vague and appeared to recognize the fact that the great fall in the river would preclude any form of continuous navigation, except through slack watering the stream.

3. The country adjacent is sparsely settled, and the chief occupation of the inhabitants is farming and stock raising. Just above Radford some iron ore is mined and there are some small lead mines in that vicinity.

4. About $110,000 has been expended on this river in improving the bars by building chutes or sluiceways through them. This afforded possible light-draft navigation and was used to some extent a number of years ago. But little has been done on this river since 1882. There is a very small commerce carried on in the lower part of the reach under consideration by the use of so-called keel boats, which are towed or poled. There being no connection with the river below, the commerce is local.

5. The district officer reports that between Glenlyn and Radford there is no particular need or demand for improvement, and that between Hinton and Glenlyn the commerce is small and the depth of the water now maintained is sufficient for present demands. He therefore reports that the river is unworthy of improvement, and in this view the division engineer concurs.

6. Interested parties were advised of the unfavorable report of the district officer and given an opportunity of presenting their views to the board, but no communications on this subject have been received.

3071 7. There is very little commerce on this river at present, and as there are no commercial or mining industries of importance, no material increase could be expected even if it were improved. Physical conditions are such that it could not be improved for useful navigation except at prohibitive cost. The board, therefore, reports, concurring with the views of the district officer and the division engineer, that it is not advisable for the United States to undertake the improvement of New River from Radford, Va., to Hinton, W. Va.

8. In compliance with law, the board reports that there are no questions of terminal facilities, water power, or other related sub-

jects which could be coordinated with the suggested improvement in such manner as to render the work advisable in the interests of commerce and navigation.

For the board:

Wm. T. Rossell,
Colonel, Corps of Engineers,
Senior Member of the Board.

PRELIMINARY EXAMINATION OF NEW RIVER FROM RADFORD, VA., TO HINTON, W. VA.

WAR DEPARTMENT,
UNITED STATES ENGINEER OFFICE,
Wheeling, W. Va., November 21, 1912.

From Maj. F. W. Altstaetter, Corps of Engineers.
To: The Chief of Engineers, United States Army (Through the Division Engineer).
Subject: Preliminary examination of New River from Radford, Va., to Hinton, W. Va.

1. In compliance with letter of August 3, 1912, from the department, the following report on the preliminary examination of New River from Radford, Va., to Hinton, W. Va., is submitted, as required by the river and harbor act approved July 25, 1912.

2. The New River rises in western North Carolina and flows in a general northerly direction, uniting with the Gauley River to form the Kanawha River. Hinton is located 57 miles above the mouth of New River, and Radford is 84 miles farther up, or 141 miles above the mouth. The drainage area above Hinton is 5,600 square miles and above Radford 2,725 square miles. Drawing K 12/51 (inclosed herewith) shows the river from Hinton and Radford and also its position with respect to the main lines of transportation in the vicinity.

3. The entire New River flows through sparsely settled rugged mountain country. There are no towns of any size between
3072 Hinton and Radford. According to the census of 1910,
the population of the adjacent counties was as follows:

Summers County, W. Va	18,420
Mercer County, W. Va	38,371
Monroe County, W. Va	13,055
Giles County, Va	11,623
Pulaski County, Va	17,246
Montgomery County, Va	17,268

The principal cities are Radford and East Radford, Va. (6,202); Pearisburg, Va. (646); Hinton and Avis, W. Va. (5,088). There is a small hamlet of Glenlyn, with a population of 52, situated 30 miles above Hinton, where the Norfolk & Western and Coal & Coke Railroads leave the river.

4. The inhabitants are engaged chiefly in farming and stoc raising. There is a small quantity of timber and staves marketed There is no underlying coal, the New River fields being some distance from the section under consideration. Just above Radford some iron ore is mined, and there are also some small lead mines in that vicinity.

5. From Hinton to the head of slack water in the Kanawha, a distance of 64 miles, the fall is almost 750 feet. There are many bridges and steep rapids along this portion, including Kanawha Falls, which is about 16 feet high. This whole section is unfavorable for navigation, and the river above it could not be connected with navigation in the Kanawha by the expenditure of any reasonable amount. The navigation between Hinton and Radford must therefore be considered as having no outside river connection. The Chesapeake & Ohio Railroad parallels the river from Hinton to its mouth and continues on down the Kanawha River.

6. Physical characteristics.—From Hinton to Radford the river is shown by seven drawings [11] (inclosed herewith), marked K 12/52, 53, 54, 55, 56, 57, and 58. A survey of this river was made in 1873, and maps of that survey with other information obtainable were used in preparing the above drawings. The river has a breadth varying from 500 to over 1,000 feet, with an average breadth of about 600 feet. The lowest published discharge measured at Radford is given as 1,830 cubic feet per second, but as the discharge in the Kanawha River has been measured as low as 1,100 cubic feet per second, that in the New River is probably lower than indicated above. From a study of the gauges at Radford and Hinton and other sources it appears that at extreme low water the controlling depths over the bars may drop to less than 1 foot. This is due to the great rapidity of the current, the drop between these two places being about 348 feet. The headwaters of the river being in some of the highest mountains east of the Rockies a good discharge is ordinarily maintained, and 2 feet found over the bars.

From Hinton to the vicinity of Glenlyn a boat drawing 2
3073 feet will have sufficient depth of water for navigation at
practically all times. Mean stage conditions give 3 feet over nearly all bars. The river, however, partakes of the characteristics of a mountain stream, with very rapid current and bad rapids, and therefore navigation is dangerous on it.

The drop of the surface of the water is shown in the profiles on the drawings. This whole country has outcroppings of rock over much of the area. The river bottom and banks are rock in many places, so that little change has taken place in years except that the iron-ore washings in the upper river have deposited sediment in the quieter and deeper reaches, and where improvements have been made at the bars loose stones placed there have been moved.

---

[11] Not printed.

The valley is generally narrow, with many steep bluffs frequently rising sheer from the water's edge. At places there is a narrow bench of fertile soil lying quite low, but most of it is well above flood stages.

The Weather Bureau reports 14 feet as a flood stage, both at Hinton and at Radford. At the Radford gauge the extreme variation of water recorded is 36 feet, while at Hinton it is 22.5 feet.

7. Previous examinations, etc.—The previous examinations and reports on this portion of the New River have been made as follows:

First. Survey of 54 miles of the river between Sinking Creek and Greenbrier River was made in 1819 by Moore and Griggs, under the auspices of the board of public works of the State of Virginia, with a view to connecting the waters of the James and Kanawha Rivers by that route.

Second. Examination for 128 miles from the lead mines in Wythe County to the mouth of the Greenbrier River at Hinton. (See Annual Report Chief of Engineers, 1873, pp, 78 and 842.)

Third. Examination of the New River, W. Va., at its confluence with the Greenbrier River. (See Annual Report Chief of Engineers for 1904, pt. 3, p. 2617.)

8. Work done.—The only work done in the past has been the improvement of some of the bars by building a channel chute or sluiceway across them. This channel was about 50 feet wide and 2 inches deep at extreme low water, and was made by cutting out rock where necessary and piling up stones along the sides of the chute to direct the water through it. The work extended from Hinton for a distance upstream of about 25 miles. About $110,000 was expended in this work. The last work was done in 1882, except for the expenditure of $10,000, and the chutes have deteriorated in the meantime due to the natural action of ice and the current.

3074 9. Commerce.—Above Glenlyn the river is paralleled most of the way by two railroads, and there is no river commerce. From Hinton to Glenlyn, a distance of 30 miles, there is some commerce, consisting of lumber, staves, sand, gravel, and also some grain, hay, farm products, and miscellaneous merchandise. No statistics are on hand, but I am informed that the commerce at Hinton amounts to about two railroad carloads per day, and, as Hinton is the only town on this 80-mile section, this is some measure of its amount. This estimate of two carloads a day is thought to be excessive and is believed to be true only at times. In 1883 there were about 17 keel boats in this traffic, and there are said to be 10 or 12 such boats now on the river. These keel boats, as they are called, are the popular boats for this traffic, having an average length of 60 feet, width of 6 to 8 feet, and carrying 20,000 to 27,000 pounds. Their draft is generally about 2 feet. The commerce is altogether local. During the winter season, from December 1 to April 1, the roads are in poor condition, and the inhabitants experience difficulty in transportation of supplies. The section from Glenlyn to Hinton lies almost entirely in Summers County and only traverses about one-half of it. Summers County had a population, at the last census, of 18,420. Probably no more than 2,000 or 3,000 people at most are in any way dependent upon this section of the river. The improvement of the river would probably cause a small increase in commerce, but not a very large one, as there is nothing to move.

10. Obstructions.—The following is a list of bridges, with principal span, and clearance above low water:

Norfolk & Western Ry. bridge at Radford:	
Principal span	130 feet
Clearance	31 feet 7 inches
Highway bridge at Radford:	
Principal span	114 feet.
Clearance	57 feet 2 inches.
Norfolk & Western Ry. bridge near Pepper:	
Principal span	140 feet.
Clearance (about)	33 feet.
Highway bridge at Eagleston:	
Principal span	225 feet.
Clearance	34 feet 5 inches.
Norfolk & Western Ry. bridge at Ripplemead (Big Stoney):	
Principal span	110 feet.
Clearance	32 feet.
Highway bridge at Ripplemead:	
Principal span	150 feet.
Clearance (estimated)	32 feet.
Highway bridge at Narrows, Va.:	
Principal span	216 feet 9 inches.
Clearance	27 feet 8 inches.
Virginia Ry. bridge at Glenlyn:	
Elevation extremely high. No data as to dimensions.	
Highway bridge at Hinton:	
Principal span	242 feet 6 inches.
Clearance (middle of second span)	53 feet 5 inches.

3075 There are no dams in this section of the river.

11. Improvement desired.—The inhabitants between Glenlyn and Radford seem to have no desire whatever to have the river improved. The following are quoted from statements made by some of the citizens in this section:

"Can see no advantage in the project, that part of the State being well provided for with railroads.

"Never heard of anyone who wanted any improvement of the river.

"Think the cost would be very excessive for the benefits that would be derived.

"The idea is entirely new to me; never heard it discussed.

"Do not know of any demand for an improvement.

"Do not think any use would be made of the slack water if provided.

"Do not know of any demand for river improvement.

"Regard this scheme as entirely impracticable; in fact, consider it foolish to contemplate.

"See no demand, either present or prospective, for slackwater navigation.

"Do not think it practicable to improve a short piece of the river without an outlet in the Ohio, which is, of course, impracticable."

From Glenlyn to Hinton inquiry among the inhabitants revealed no one who had heard anything about a possible improvement, but they were more favorably impressed with the idea than the inhabitants in the section from Glenlyn to Radford. Briefly, they favored some form of slack-water navigation, and thought that the river was not suitable for improvement except by slack water. The following are statements made by various prominent citizens of this section:

"Anxious to see something done that would open up the country.

"Consider it would be more advantageous for a pool of water from Narrows to Hinton.

"Think that section certainly needs something done to develop it.

"Think that section of river between Glenlyn and Hinton deserves an improvement.

"Think it probable that most of the timber adjacent to the river has been cut, but there remain great quantities of staves, ties, bark, etc., that will continue for years and that could profitably be shipped by water.

"The chutes made years ago by the Government are used by bateaux in shipping sawed lumber, etc.

"Consider this the worst tied-up country I ever saw."

12. Conclusions and recommendations.—Between Glenlyn and Radford there is no particular need for improvement of the river
and no particular demand for it. Between Hinton and
3076 Glenlyn there is no point more than 15 miles from the
railroad, and that is not an excessive distance to go by
wagon. The number of people and the amount of commerce to be benefited by improvement is small. The depth of water now maintained over this reach is sufficient for the present demands of commerce the principal objection being the swift current. This could be obviated only by slack-water improvement, which

would require 10 dams with a lift of 18 feet each, or their equivalent. It is not believed that the river between Hinton and Radford is worthy of further improvement and it is recomended that no survey be made.

ADDITIONAL SUBJECTS

13. Terminal facilities.—There are practically no terminal facilities for river traffic along this entire section and no mechanical appliances except a simple elevator at Hinton for loading crossties into railroad cars. This is owned by the Chesapeake & Ohio Railroad Co., is seldom used, and is available to the public. There being such little commerce, there seems to be no special demand for terminal facilities.

14. Water power.—Due to the great fall of the river, the narrow sparsely inhabited valley, and the large low-water discharge of the New River, the question of using the water power would merit considerable attention should the river ever be improved by means of locks and dams; in fact, water power could be developed in such large quantities that if a combined water power and navigation project should ever be carried out, navigation would probably be a secondary consideration. At Kanawha Falls, below Hinton, a water-power plant is now established, while above Radford water power is also being developed in the New River. As the total fall from Glenlyn to Hinton is 128 feet and the low-water discharge probably over 1,000 cubic feet per second, the amount of water power available is apparent. Above Glenlyn the presence of the railroads, which are quite near the water surface, would complicate the matter should high dams be built. Coal, however, is very cheap in this vicinity, so that water-power development may not be as attractive as appears on the surface.

15. Other subjects.—There are no other subjects deserving of consideration in this connection.

F. W. ALTSTAETTER.

(First Indorsement)

OFFICE DIVISION ENGINEER, CENTRAL DIVISION,
November 29, 1912.

The CHIEF OF ENGINEERS:

1. I concur in the views of the district officer, and do not consider it advisable to undertake the improvement of New River at this time.

3077 2. In addition to the examinations referred to by the district officer there have been the following:

Letter from the Secretary of War. April 21, 1913.—Referred to the Committee on Commerce and ordered to be printed.

War Department,
Washington, April 18, 1913.

The President of the Senate.

Sir: In response to Senate resolution dated April 8th instant, directing the Secretary of War "to furnish to the Senate, if consistent with public interests, copies of all documents and papers in his office or under his control relating to the building of dams or reservoirs by private interests in the Cheat and New Rivers, in the States of Virginia and West Virginia, and copies of all correspondence had with his department relating thereto, together with copies of all rulings or permits, if any, issued or made by his department authorizing the building of any such dams or reservoirs." I have the honor to transmit, herewith, photostat copies of all papers, correspondence, rulings, permits (without maps), etc., of record in the department pertaining to the construction of dams or reservoirs by private parties in Cheat and New Rivers, Va. and W. Va.

Very respectfully.

Lindley M. Garrison,
Secretary of War.

LYNCHBURG, VA., *November 7, 1899.*

SECRETARY OF WAR.

DEAR SIR: Will you please inform me whether the New River of Virginia is under your jurisdiction by reason of its navigability or not.

In other words, I desire to know respecting building dams; and hence if you have any control over such matter, 3079 kindly inform me between what points.

Your prompt attention to this will greatly oblige.

Yours, etc.,

PETER J. OTEY, *M. C.*

Can you not send me some publication regarding the matter?

(Second indorsement)

OFFICE CHIEF OF ENGINEERS,
UNITED STATES ARMY,
November 9, 1899.

Respectfully returned to the Secretary of War.

New River rises in North Carolina and crosses the line between that State and Virginia nearly at the mouth of Wilson Creek in Grayson County. After flowing in a general easterly direction from the mouth of Wilson Creek, it turns down again into Alleghany County, N. C., whence it soon recrosses into Virginia, thence into West Virginia, where it forms a junction with the Gauley.

The whole of the river from Wilson Creek to its mouth has been surveyed from time to time under the direction of Congress. In 1879 a survey of that portion in Grayson County was surveyed and projects for its improvement submitted. At the time this survey was made that portion of the river was not used for transportation purposes, only the ordinary canoe used for ferrying and fishing being seen; but it was stated by the officer who made the survey that a study of the regimen of the river showed that "there is an abundance of water for any system of navigation that may be inaugurated."

Projects were presented:

1. For keelboat navigation with a channel not less than 2 feet deep and 30 feet wide, by rock excavation, removal of bowlders, sand, and gravel, etc., $115,000.

2. For steamboat navigation with channel depths of 3 feet and 5 feet, at cost of $1,200,000 and $1,600,000, respectively.

By the rivers and harbors act of June 14, 1880, Congress
3080 appropriated $24,000, for improving the river from the
mouth of Wilson, in Grayson County, to the mouth of the
Greenbrier River, in West Virginia, and additional appropriations
were made in the acts of 1881, 1882, and 1886.

Work was carried on under these appropriations until 1889, when it was suspended on account of changed conditions which lessened the usefulness of the river as a means of transportation, such as the great development of the railroad systems paralleling the river.

The cost of canalizing this river would be very great and out of all proportion to the benefits to be derived now or in the near future, and at the present time this river is not considered worthy of further improvement by the General Government, but the country is rich in minerals and agricultural products, and as these become enlarged the importance of the river as a natural transportation route may increase to such an extent as to lead Congress to adopt a slack-water system of improvement.

While no work has been carried out on this river for the past 10 years and while there is not understood to be any actual navigation at the present time on the section of the river over which it is desired to construct a dam, it would appear that the action heretofore taken by Congress has indicated its opinion that the New River is a navigable water of the United States, and that under the existing laws the consent of Congress is necessary before a dam can be legally built thereon.

A pamphlet containing the laws on the subject is herewith.

A. MacKenzie,
Acting Chief of Engineers.

War Department,
Washington, November 10, 1899.

Sir: In response to the request contained in your letter of 7th instant, I have the honor to transmit herewith copy of a report of the Acting Chief of Engineers, United States Army, relative to the navigability of New River, Va., also a pamphlet containing the laws on the subject.

Very respectfully,

Elihu Root,
Secretary of War.

Hon. Peter J. Otey,
Lynchburg, Va.

3081 **LAWS FOR THE PROTECTION AND PRESERVATION OF THE NAVIGABLE WATERS OF THE UNITED STATES**

(Pamphlet containing excerpts on the River and Harbor Acts for 1899, 1902, 1894, 1900, and 1905 is omitted.)

(Scott & Staples, attorneys at law, 608–9–10, Terry Building.)

ROANOKE, VA., *November 7, 1899.*

DEAR SAM: Col. Fries, of Winston, wants to know whether or not New River in Grayson County is a navigable stream or under the dominion of the Federal Government. He is interested with a company which wants to build a dam across the river 6 miles above Grayson Springs on or near Chestnut Yards, on the Norfolk & Western Railroad. If the river is not navigable, the owners of the land on the bank of the river, or riparian owners, own to the middle of the stream. If the river is navigable, they own only to low-water mark. If the river is not navigable, they can get authority from the county court of Grayson County to put a dam across the river. If it is navigable, they have to get the consent of the Federal Government.

It is of the utmost importance that they should know about this matter before the 15th. Will you please go to the War Department and ascertain there all the information you can for me on the subject, and let me know. If you discover tomorrow that you cannot get the information yourself, please telegraph me, and if necessary I will go to Washington and get it.

All are as well as usual. Mary Kellogg is up and about again. Let me hear from you as soon as possible, and if necessary for me to get the information that I should go to Washington, telegraph me tomorrow and I will leave here tomorrow night or the next day.

Your affectionate brother,

ABRAM P. STAPLES,

WAR DEPARTMENT,
Washington, November 11, 1899.

SIR: Referring to the letter addressed to you by Abram P. Stables, of Roanoke, Va., expressing a desire to secure
3082 information relative to the navigability of New River, Va., I beg to invite attention to the accompanying copy of report of the Acting Chief of Engineers, United States Army, on the subject, which it is thought contains the information desired.

Very respectfully,

ELIHU ROOT,
Secretary of War.

DR. SAMUEL GRANVILLE STAPLES,
1416 Twentieth Street, NW., Washington, D. C.

HOUSE OF REPRESENTATIVES, U. S.,
Washington, D. C., March 13, 1900.

RETARY OF WAR.

EAR SIR: Will you kindly give me any information in your ession in regard to New River, Va., as a navigable stream. ase see inclosed letter and favor me by returning it with full wer, and oblige.

Yours, etc.

PETER J. OTEY.

(Second indorsement)

OFFICE CHIEF OF ENGINEERS,
UNITED STATES ARMY,
March 19, 1900.

espectfully returned to the Secretary of War.

ew River rises in North Carolina and crosses the line between t State and Virginia nearly at the mouth of Wilson Creek in yson County. After flowing in a generally easterly direction m the mouth of Wilson Creek, it turns down again into Alleny County, N. C., whence it soon recrosses into Virginia, thence West Virginia, where in forms a junction with the Gauley er.

he whole of the river from Wilson Creek to its mouth has been veyed from time to time under the direction of Congress.

y the river and harbor act of June 14, 1880, Congress approated $24,000 for improving the river from the mouth of Wilson

Creek in Grayson County, Va., to the mouth of Greenbrier
3 River in West Virginia, and additional appropriations
were made in 1881, 1882, and 1886.

Vork was carried on under these appropriations until 1889, en it was suspended on account of changed conditions which ened the usefulness of the river as a means of transportation, h as the great development of the railroad systems paralleling river. Radford, the locality mentioned in the within comnication, is between the mouth of Wilson Creek and the mouth the Greenbrier River, and consequently is on the stretch of river for the improvement of which Congress has made approations.

While no work has been carried out on this river for the past years, and while there is not understood to be any actual naviion on the section of the river over which it is desired to conict a dam, it would appear that the action heretofore taken Congress has indicated its opinion that New River is a navile water of the United States and, under the existing laws, the sent of Congress is necessary before a dam can legally be built reover.

A pamphlet containing the laws of Congress on the subject is herewith, and attention is invited to section 9 of the act of March 3, 1899.

JOHN M. WILSON,
Brig Gen., Chief of Engineers, U. S. Army.

WAR DEPARTMENT,
Washington, March 19, 1900.

DEAR SIR: Referring to previous correspondence on the subject, and especially to your letter of 18th instant requesting information respecting New River, Va., especially as to whether it is held to be a navigable stream, I beg to inclose herewith for your information a copy of a report of the Chief of Engineers of this date, together with the pamphlet therein referred to containing the laws of Congress on the subject, and inviting attention to section 9 of the act of March 3, 1899.

Very respectfully,

G. L. MICKLEJOHN,
Acting Secretary of War.

Hon. PETER J. OTEY,
House of Representatives.

3084 IN RE THE APPLICATION MADE TO CONGRESS BY F. H. FRIES AND W. C. RUFFIN, OF THE STATE OF NORTH CAROLINA, FOR PERMISSION TO ERECT A DAM ACROSS NEW RIVER, IN GRAYSON COUNTY, VA.

The following data and explanation thereof have been collected and arranged for consideration in connection with the above application:

Col. F. H. Fries and Mr. W. C. Ruffin propose to erect a cotton mill on the bank of New River, in Grayson County, Va., about 6 miles above Grayson Spring, and near the mouth of Stephens Creek, and contemplate the expenditure thereon of something over half a million dollars. To this end, they have made application to the authorities of the State of Virginia, as provided by law, for their permission to erect across the said river a dam to supply the water power for this enterprise. The State authorities have authorized the erection of the dam across said river at said point, the evidence of which is in the following records:

TO THE HONORABLE J. C. PADGETT,
Judge of the County Court of Grayson County, Va.:

Your undersigned commissioners, J. B. Waugh, H. W. Clark, R. L. Dickenson, T. L. Gwyn, and F. H. Ward, who were appointed by the order of your honorable court to meet on the site of the proposed mill and dam and canal on New River, on the 5th day of April, 1900, and inquire and ascertain whether the mansion house of any person or the outhouses, yards, gardens, or orchards thereto belonging will be overflowed or taken by the erection of the proposed dam or the construction of the proposed canal, and whether and in what degree ordinary navigation and the passage of fish will be obstructed thereby, whether by any, and if any, and by what means such obstruction might be prevented, and whether the health of the neighbors will be injured by the stagnation of waters or otherwise, and with directions to circumscribe so much of the lands not owned by the applicants as will be necessary for the canal, dam, or work to be constructed as aforesaid, not being (beyond what is in the bed of the watercourse) more than one acre for a dam, nor more than 100 feet in width for a canal, and to ascertain what will be a just compensation therefor, and the lands which will probably be overflowed or deprived of water, or otherwise injured by such canal or dam, or be injured by the construction of the work aforesaid shall likewise be examined by them, and they shall ascertain what will be a just compensation to the several owners thereof for the damages to the same, respectively, and to report their proceedings to court, beg leave to submit the following report:

On the 6th day of April 1900, your undersigned commissioners, having first been duly sworn according to law, assembled on the site of the proposed dam, mill, and canal. The certificate of their oath is attached to this report.

That the site of the proposed mill is on the north side of New River, near where Eagle Bottom Creek empties into the same, and not far from the residence of Alfred G. Bartlett, and on the lands of F. H. Fries and W. C. Ruffin.

They find that the site of the proposed dam is across New River, above the upper line of the Jones and Littrel tract, and below the mouth of Stephens Creek; and that the said F. H. Fries and W. C. Ruffin own the land on both sides of the river within the points above designated. They find that the proposed
3084-A canal will extend from the said dam to the said mill
site, and will lie exclusively within the boundaries of the lands of the said F. H. Fries and W. C. Ruffin.

Your commissioners further report that neither the mansion house nor the outhouses, yards, garden, or orchards of any person will be overflowed or taken by the erection of the proposed dam, or the construction of the proposed canal, provided the dam be not in excess of 30 feet in height.

They report that New River at this point is not navigable, and, therefore, the erection of a dam at this point will not in any way interfere with navigation.

They further report that the effect of the erection of the proposed dam will be to obstruct the passage of fish, unless a proper fish ladder is constructed, but if such fish ladder be constructed, then the obstruction by the erection of a dam will be prevented.

They report that the health of no one will affected by stagnant water or otherwise.

They report that no water raised or backed by the erection of the said dam will flood any lands except those owned by the said F. H. Fries and W. C. Ruffin, or the lands on which they have acquired water rights, and have liquidated and settled any contingent or possible damage.

They find that no one will be damaged by the erection of the said dam, or the backing or overflowing of water resulting therefrom.

They further report that there will be no deprivation of water to any person which will operate or interfere with the use of New River below the said dam for any mill purpose, or otherwise, and that no one will be damaged in any way by any deprivation of the water resulting from the erection of the dam, construction of the mill, or the operation.

J. B. WAUGH,
H. W. CLARK,
R. L. DICKENSON,
T. L. GWYN,
F. H. WARD.

VIRGINIA, *County of Grayson, to wit:*

I, T. C. Vaughan, a notary public in and for the county and State aforesaid, do hereby certify that J. B. Waugh, H. W. Clark, R. L. Dickenson, T. L. Gwyn, and F. H. Ward this day personally appeared before me in my State and county aforesaid and made oath that they will, each and every one of them, well and truly perform their duties as commissioners to examine into and report to the county court their findings as to damages in the matter of the application of F. H. Fries and W. C. Ruffin to erect a dam across New River, to construct a canal, and to build a mill, engines, and other machinery.

Given under my hand this the 5th day of April, 1900.

THOS. C. VAUGHAN, *Notary Public.*

VIRGINIA, *Grayson County Court, April 6, 1900:*

On motion of F. H. Fries and W. C. Ruffin for leave to build a dam across New River, and build a mill, and open a canal on the lands of the said F. H. Fries and W. C. Ruffin.

This day, April 6, 1900, came F. H. Fries and W. C. Ruffin by their attorneys and the commissioners heretofore appointed by an order of the county court of Grayson County, entered on the

3d day of April, 1900, upon the motion of said F. H. Fries and W. C. Ruffin, to go upon the lands and real estate set out in the application for the appointment of said commissioners, having returned their report to court on this day, and there being no exceptions to said report, and no one appearing to contest said application, and said report showing that no one will be damaged by the erection of the dam, the digging of the canal, and the erection of the mill for which leave is sought, and it appearing that said proposed canal is wholly upon the lands of said applicants, it is ordered that said report be, and the same is hereby, confirmed, and the said applicants are hereby authorized and empowered to erect, construct, and make the dam, canal, and mill as requested in said application.

And it is further ordered that the said applicants erect a suitable fish ladder for the passage of fish over and across said dam.

Virginia, *Grayson County, to wit:*

I, F. J. Lundy, clerk of the county court of Grayson County in the State of Virginia, do hereby certify that the foregoing is a true copy of the report of the commissioners made and returned under an order of the said county court of Grayson, on the 3d day of April, 1900, appointing them for the purposes contemplated by section 1347 of the Code of Virginia, 1887, and which is fully set out in the report aforesaid, together with a copy of the order of the said county court, confirming said report.

3084-B Given under my hand and seal of the said county court of Grayson County this 11th day of April, 1900.

[SEAL.]

F. J. Lundy,
Clerk Grayson County Court.

Virginia, *Grayson County, to wit:*

I, J. C. Padgett, judge of the county court of Grayson County, in the State of Virginia, do hereby certify that F. J. Lundy, whose name is signed to the foregoing certificate, is the duly elected and qualified clerk of the said court, and that due faith and credence should be given to his said certificate.

Given under my hand this 19th day of April, 1900.

J. C. Padgett,
Judge of the County Court of Grayson County, Va.

Virginia, *County of Grayson, to wit:*

I, F. J. Lundy, clerk of the county court of Grayson County, in the State of Virginia, do hereby certify that J. C. Padgett, whose name is signed to the foregoing certificate, is the duly commissioned and qualified judge of the county court of Grayson County, Va., and that due faith and credit should be given to his said certificate.

In testimony whereof, I have hereunto this 19th day of April 1900, affixed my hand and seal of the county court of Grayson County, Va.

[SEAL.]

F. J. LUNDY,
Clerk of the County Court of Grayson County, Va.

And since action was at one time taken by Congress looking to the improvement of New River in this section, for purposes of limited navigation, it is deemed advisable to secure from Congress permission to erect the dam across the said river at the locality mentioned.

The first action taken by Congress looking to the improvement of this section of New River is found in the river and harbor bill of June 23, 1876, volume 18, of the Statutes at Large, part 3, page 237, which directs the Secretary of War—

"to cause examinations or surveys or both to be made at the following points: On New River from the lead mines in Wythe County to the 'mouth of Wilson' in Grayson County, Va."

It does not appear from the report of the Chief of Engineers of the Army for the year 1876 (C. Appendix S, p. 4) that any report was made in reference to the matter of the improvement of the said river.

The next record appears in the river and harbor bill of June 18, 1878 (vol. 20, Stat. L., p. 153), which provides that—

"the Secretary of War is hereby directed at his discretion to cause examinations or surveys or both and estimates of the cost of improving the property to be made at the following points (p. 154): New River from the lead mines in Wythe County to the 'mouth of Wilson' in Grayson County, Va."

In the report of the Chief of Engineers of the Army for the year 1878 (Appendix F, p. 8) appears a synopsis of the plan of the improvement of New River, and on page 495 a full discussion of the said plan. The synopsis reports the adoption—

"of a plan for the improvement of this river, which contemplates a channel 30 feet wide and 2 feet deep below the lowest water, satisfactory for keel boats now in use, but at the same time capable of utilization and adaptation at some future time to a further improvement of the navigation and for light steamboats."

By river and harbor bill of June 14, 1880 (vol. 21, Stat. L., p. 180), there was appropriated for improving New River from the "mouth of Wilson" in Grayson County, Va., to the lead mines in Wythe County, the sum of $5,000, which is the first appropriation for the improvement of this section of New River.

3084-C In the report of the Chief of Engineers of the Army for the year 1879 (Appendix F, p. 530) is found a full statement of the topography of this section of New River, in which is included a report of the engineer in charge, from which the following is an extract:

"At present this portion of the river is not used at all for transportation purposes. Only the ordinary canoe is seen, and it is merely used for ferrying and fishing. For boat navigation a channel 2 feet deep and 30 feet wide, with tracking or tow-paths at the falls and rapids will answer all purposes. Rock excavation, removing bowlders, stone and gravel, and building lateral dams will cost for the 62 miles $115,000."

In the report of the Chief of Engineers of the Army for the year 1881 (p. 905, Appendix G), Col. W. P. Smith reports as follows:

"For 5 miles above the lead mines the obstructions in the river are about the same as described elsewhere, then the fall becomes very rapid, as the mountains are here reached. These extend for 14 miles, which will necessarily make the work very heavy for that distance. As Fosters Falls, 37 miles above the New River Bridge, offers such an obstruction as to prevent the lead mines and furnaces above from shipping their products down the river, it is respectfully recommended that a careful survey be made of them with a view to their improvement by locks and dams. The fall is about 18 feet over slate and limestone ledges in 2,300 feet, with a short pool and a succession of ledges."

And on page 907 Col. Smith increases the estimate which was made for a 30-foot channel 2 feet deep, at $115,000, to a modified plan for a 20-foot channel 2 feet deep, at a cost of $205,000.

River and harbor bill of October 3, 1881, carried no appropriations for this section of the river.

From the report of the Chief of Engineers for the year 1882 the following extract is taken:

"The work covers a space of 5½ miles from the lead mines to Wilkinson's Forge, passing over eight shoals and ledges, with a fall of 49.26 feet in that distance. The original plan of improvement has been adhered to, except the width of the channels on the middle and upper divisions has been reduced to 20 feet and on the former to 10 feet."

It seems that this work was done during the year 1881, and nothing done during the year 1882.

River and harbor bill of August 2, 1882 (vol. 22 Stat. L., p. 191), appropriates $5,000 for the improvement of this section of the river.

Being without the report of the Chief of Engineers of the Army for the year 1883, and referring to his report for the year 1884, it appears that something like $11,000 was expended over that entire section of the river extending from Greenbrier River in West Virginia to the "mouth of Wilson," in Grayson County, Va.

No work was done by the department on this section of the river in 1884, and there remained an unexpended balance of $3,079 during the year 1885, $2,500 of which was expended on the next mile immediately above the 5¼-mile point above the lead mines referred to in the last quotation.

The river and harbor bill of August 5, 1886 (vol. 24, Stat. L., p. 310), carried an appropriation of $10,000 for this improvement.

In the report of the Chief of Engineers of the Army for the year 1887 the following appears:

"The portion of the river to which it (the appropriation) is applicable is above Foster's Falls, and these can only be passed by one or two locks, at a cost much greater than Congress is likely to authorize. There is also a strong reason for doubt whether, considering the present developments of that section of the country, the construction of such locks would be justifiable, even if the money were available. The construction of railroads near this stream has for the present very much diminished the importance of the improvements to the portion above Foster's Falls."

3084-D And in that report the report of Col. Craighill is cited, as follows:

"While there is much development in progress, and more in prospect for the country on and near this upper section, yet the recent examination of Col. Smith would seem to indicate that while the rafting of timber would be facilitated by expending the available $10,000 in the method suggested by him that kind of navigation is already practicable, and the expenditure of the money would not be advantageous to any important extent to navigation by push boats. Under all the circumstances it seems unnecessary to spend $10,000 on the upper New River in 1887, and it is accordingly recommended that the money be held in reserve." (See Appendix L, p. 1926.)

On page 1927 the report of Col. William Proctor Smith, assistant engineer, states:

"It is thought that the $10,000 now under consideration will make such a channel 20 feet wide and 2 feet deep as far as the Grayson Sulphur Springs, 6.8 miles above the Ivanhoe furnace, into the timber region. Anyhow it will make it as far as the new mineral company's ferry at Cripple Creek; 5¾ miles above the initial point where timber can be had."

The point referred to is the Grayson Sulphur Springs, which it seems is the extreme distance over which the appropriations would *would* permit any improvement, and is between 6 and 7 miles below the point at which it is desired to erect a dam.

The report of the Chief of Engineers of the Army for the year 1886, after considering the report of Col. Smith cited above, says (Appendix M, p. 7):

"After a careful reexamination of the subject and a reconnoissance it was decided to postpone the expenditure of the appropriation until the will of Congress could be further ascertained."

And in the same appendix, page 1760, referring to the section of the river above the lead mines, Col. Craighill says:

"A doubt having arisen, in view of the changed condition of affairs on and near the river, as to the propriety of expending this appropriation at once, it was decided by proper authority to defer operations until the will of Congress could be ascertained."

From the report of the Chief of Engineers for the year 1889 (Appendix O, p. 1962) the following extract is taken:

"The shoals are composed of loose rock and gravel, and had filled up considerably since the formation of the project two years ago. * * * About 35 cubic yards of material was removed from these shoals and built into walls."

This appears to be all of the work that was done during that fiscal year.

From the report of the Chief of Engineers for the year 1890 it appears (Appendix P, p. 7) that—

"In 1885 there was a channel 2 feet deep and 20 feet wide from the Ivanhoe Furnace to within 600 feet of the head of Wilkinson's shoals and ledges, a distance of 3.9 miles. In 1889 this channel with the same width and depth was extended to the lower end of the approach to the gulf, a distance of 5 miles from the initial point, with four-tenths of a mile farther up the river partially improved. The amount expended during the year ending June 30, 1890, has been $6,394."

From the report of the Chief of Engineers of the Army for the year 1891 (Appendix Q, p. 2432), the following extract of Col. Craighill is taken:

"Here attention is called to the effect of the changed condition, which sometimes arises, and New River is a striking illustration of it. In a country rich in minerals and agricultural products a natural waterway may be of great value, especially if there be no competing railroads and the cost of its improvement be not very great. In course of time competing railroads are 3084-E built, the topography being favorable. If the expense of the improvement of the river be great and the available money little, the railroads will take the business, and the river becomes comparatively unimportant. This has for several years been the situation in the New River section of the country, especially the upper portion.

"This condition seems to have been recognized by Congress, from the fact that there were no appropriations for New River in 1883, 1884, and 1885.

* * * * * * *

"There was also considerable reason for doubt whether, considering the present development of that section of the country, the construction of such locks (referring to Fosters Falls) would be justifiable, even if the money were available. The construction of railroads near this stream has diminished very much the importance of the improvements of the portion above Fosters Falls.

* * * * * * *

"In 1889, the channel, with the same width and depth (20 feet, and 2 feet), was extended to the lower end of the approach to the gulf, a distance of 5 miles from the initial point (lead mines), with four-tenths of a mile farther up the river partially improved. This is obviously a very local improvement, made almost entirely of rock, at a great expense, and in my opinion of no value whatever.

"No work was done in the calendar year 1890, and none has been possible as yet in the year 1891, the water being too high and too cold."

From the report of the Chief of Engineers of the Army for the year 1892, it appears that there was no work done during that fiscal year. It appears that no work was done during the year 1893.

His report for the year 1894 shows a balance of $2,341.79 on hand remaining from the appropriations made by Congress for the improvement of this section of the river, and in his report for the year 1897 (Appendix V, p. 2567), the report of Maj. Craighill states:

"Any further improvement of that portion of the stream was apparently unnecessary on account of the changed conditions" and in his report for the year 1898 (Appendix W, p. XIV), the Chief of Engineers of the Army says:

"As conditions have changed in late years, the further improvement of that portion of the stream has been reported as entirely unnecessary, and the Secretary of War has decided not to expend the existing balance at present."

It is believed that this is the last report of the War Department referring to the section of New River above the lead mines in Wythe County and below the "Mouth of Wilson," in Grayson County, Va.

It will be seen that the original project for the improvement of this river had in contemplation character of navigation no more extensive than that which a channel 20 feet wide, and in places reduced to 10 feet wide, and 2 feet deep, could afford; and that this project was considered advisable in view of the conditions which existed in this section of the country at the time of its inception prior to the year 1876; which was a lack of any facilities whatever, other than those afforded by the river, for the transportation of ore and timber from this upper region down to where the railroad crossed the river. Since that time the Norfolk & Western Railroad has extended its lines up the bank of New River, past the points spoken of as lead mines, Fosters Falls, Ivanhoe Furnace, and Grayson Springs, and within 6 miles of the point where it is desired to erect a dam, and that this extension, in the opinion of the Chief of Engineers, removed the necessity for any further expenditure of money upon this section of the river.

The transportation facilities of the railroad, far surpassing those which it was intended to supply by the improvement of the river, have entirely removed the causes which prompted Congress to undertake a task so expensive and of such limited utility.

3084–F If the desired permission is granted and the dam and mills erected the railroad will, of necessity, be extended to that point, and since it was not contemplated by the Engineers of the Army or by Congress to make a continuous navigable waterway of this stream, but only to afford access by water to the railroad as it was then located, it will readily be seen that the primary cause has been removed, and if the plan were ever carried out it would be the expenditure of a large sum of money resulting in no practical benefit to anyone.

Office of the Chief of Engineers,
United States Army,
Washington, May 5, 1900.

Capt. H. F. Hodges,
Corps of Engineers, Cincinnati, Ohio.

Captain: The inclosed bill, H. R. No. 11281, Fifty-sixth Congress, first session, "A bill permitting building a dam across New River," is referred to you for report.

An early report from this office upon this bill is desired, and you are accordingly requested to report by telegraph whether there are, in your judgment, any objections to the bill in its present form.

By command of Brig. Gen. Wilson.

Very respectfully, your obedient servant,

A. MACKENZIE,
Lieutenant Colonel, Corps of Engineers.

(H. R. 11281, Fifty-sixth Congress, first session)

A BILL PERMITTING BUILDING A DAM ACROSS NEW RIVER

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the consent of Congress is hereby granted to F. H. Fries and W. C. Ruffin, of the State of North Carolina, their successors and assigns, to erect, construct, and maintain across New River, in Grayson County, Virginia, at any point within two miles of the mouth of Stephens Creek, a dam and all other works necessarily incident thereto for water-power purposes: Provided, That the said F. H. Fries and W. C. Ruffin, their successors and assigns, shall make at their own expense such change and modification of the said dam as the Secretary of War may from time to
30[illegible] time direct in the interests of the navigation of said river:
Provided further, That ladders suitable for the passage of fish over the said dam shall be constructed and maintained by the said parties, their successors and assigns, as may from time to time be required by the United States Fish Commissioner: Provided further, That in case any litigation arises from the obstruction of the channel by the said dam, or works appurtenant thereto, that the same may be tried in the courts of the United States having proper jurisdiction.

SEC. 2. That this act shall become null and void unless the dam herein authorized shall be commenced within two years and completed within five years of the date hereof.

SEC. 3. That the right to alter, amend, or repeal this act is hereby expressly reserved.

(Memo.—The committee call referred to below was returned and is not now of record in this office.)

OFFICE OF THE CHIEF OF ENGINEERS,
UNITED STATES ARMY,
Washington, May 8, 1900.

Hon. ELIHU ROOT, *Secretary of War.*

SIR: I have the honor to return herewith a letter, dated the 5th instant, from the Committee on Interstate and Foreign Commerce of the House of Representatives, inclosing for the views of the War Department thereon H. R. 11281, Fifty-sixth Conress, first session: "A bill permitting building a dam across New ₹iver," and, in reply to its reference to this office, I beg to recomnend certain amendments to the bill indicated on a copy of the ame herewith submitted. As thus amended I know of no objecion to the passage of the bill by Congress, so far as navigation nterests are concerned.

Very respectfully, your obedient servant,

JOHN M. WILSON,
Brig. Gen., Chief of Engineers, U. S. Army.

086 (Telegram)

CINCINNATI, OHIO, *May 9, 1900.*

CHIEF OF ENGINEERS, United States Army,
Washington, D. C.:

No objection known to passage in present form of H. R. 11281 uthorizing New River Dam.

HODGES, *Engineers.*

ENGINEER OFFICE, UNITED STATES ARMY,
Cincinnati, Ohio, May 10, 1900.

Brig. Gen. JOHN M. WILSON,
Chief of Engineers, United States Army, Washington, D. C.

GENERAL: I have the honor to state that, in reply to departnent letter of the 5th instant, directing telegraphic report on I. R. bill No. 11281, permitting building a dam across New River, I telegraphed the department yesterday as follows:

"No objection known to passage in present form of H. R. 11281 uthorizing New River dam."

Stephens Creek, in the vicinity of which the dam is to be built, s near the upper end of the part of New River covered by the roject for improvement and above the farthest point already eached by the work. It is not believed that any attempt will ver be made to carry the improvement so far upstream, operaions on the river having been suspended indefinitely.

There is no present or prospective navigation which would varrant any opposition to this dam, which, as I am informed, is lesired by the people of the locality.

Very respectfully, your obedient servant,

H. F. HODGES,
Captain, Corps of Engineers.

(Memo.—The committee call referred to below was returned nd is not on the records of this office.)

OFFICE OF THE CHIEF OF ENGINEERS,
UNITED STATES ARMY,
Washington, May 29, 1900.

3087 Hon. ELIHU ROOT, *Secretary of War.*

SIR: I have the honor to return herewith a letter, dated the 26th instant, from the Senate Committee on Commerce, inclosing for the views of the War Department thereon S. 4849, Fifty-sixth Congress, first session, "A bill permitting building a dam across New River," and, in reply to its reference to this office, I beg to state that I know of no objection to the passage of the bill by Congress, so far as navigation interests are concerned.

Very respectfully, your obedient servant,

JOHN M. WILSON,
Brig. Gen., Chief of Engineers, U. S. Army.

(S. 4849, Fifty-sixth Congress, first session)

A BILL PERMITTING BUILDING A DAM ACROSS NEW RIVER

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the consent of Congress is hereby granted to F. H. Fries and W. C. Ruffin, of the State of North Carolina, their successors and assigns, to erect, construct, and maintain across New River, in Grayson County, Virginia, at any point within two miles of the mouth of Stevens Creek, a dam and all other works necessarily incident thereto for water-power purposes: Provided, That the said F. H. Fries and W. C. Ruffin, their successors and assigns, shall make, at their own expense, such change and modification of the said dam as the Secretary of War may from time to time direct in the interests of the navigation of said river: Provided further, That ladders suitable for the passage of fish over the said dam shall be constructed and maintained by the said parties, their successors and assigns, as may from time to time be required by the United States Fish Commissioner: Provided further, That in case any litigation arises from the obstruction of the channel by the said dam, or works appurtenant thereto, that the same may be tried in the courts of the United States having proper jurisdiction.

SEC. 2. That this act shall become null and void unless the dam herein authorized shall be commenced within two years and completed within five years of the date hereof.

3088 SEC. 3. That the right to alter, amend, or repeal this act is hereby expressly reserved.

EXECUTIVE MANSION,
Washington, June 2, 1900.

MY DEAR SIR: The President directs me to submit the accompanying bills, H. R. 11281 and H. R. 9884, for your examination, with the request that you will inform him at the earliest practicable date whether you know of any objections to their approval.

Very truly yours,

GEO. B. CORTELYOU,
Secretary to the President.

Hon. ELIHU ROOT, *Secretary of War.*

(Second indorsement)

OFFICE CHIEF OF ENGINEERS,
UNITED STATES ARMY,
June 2, 1900.

Respectfully returned to the Secretary of War.

I know of no objection to the approval by the President of the accompanying H. R. 11281, Fifty-sixth Congress, first session, "An act permitting building a dam across New River."

JOHN M. WILSON,
Brigadier General, Chief of Engineers,
United States Army.

WAR DEPARTMENT,
Washington, D. C., June 2, 1900.

The PRESIDENT:

In returning herewith House bill 11281, Fifty-sixth Congress, first session, being an act permitting building a dam across New River, I have the honor to state that there is no objection on the part of the department to the approval of the bill.

Very respectfully,

ELIHU ROOT, *Secretary of War.*

3089 OFFICE OF THE CHIEF OF ENGINEERS,
UNITED STATES ARMY,
Washington, December 20, 1901.

Hon. ELIHU ROOT, *Secretary of War.*

SIR: I have the honor to return herewith a letter, dated the 17th instant, from the Senate Committee on Commerce, inclosing for the views of the War Department thereon S. 1719, Fifty-seventh Congress, first session, a bill permitting the building of a dam across New River.

This bill is identical with an act approved June 4, 1900, which is still in full force and effect, and the necessity for the passage of the bill is not apparent.

Section 2 of the aforesaid act provides that it shall become null and void unless the dam therein authorized shall be commenced by June 4, 1902, and completed by June 4, 1905. It may be the intention of the proponent of the bill under consideration to provide for an extension of the time for the commencement and completion of the dam. If this is the object, it, in my opinion, will be better accomplished by a simple amendment to the original act.

Favorable consideration of the bill is not recommended.

Very respectfully, your obedient servant,

G. L. **Gillespie**,
Brigadier General, Chief of Engineers,
United States Army.

(Memo.—The above-mentioned call of committee was returned; is not now on file.)

(S. 1719, Fifty-seventh Congress, first session)

A BILL PERMITTING THE BUILDING OF A DAM ACROSS NEW RIVER

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the consent of Congress is hereby granted to F. H. Fries and W. C. Ruffin, of the State of North Carolina, their successors and assigns, to erect, construct, and maintain across New River, in Grayson County, Virginia, at any point within two miles of the mouth of Stevens Creek, a dam and all other works necessarily incident thereto for water-power purposes: Provided, That
3090 the said F. H. Fries and W. C. Ruffin, their successors
and assigns, shall make, at their own expense, such change and modification of the said dam as the Secretary of War may from time to time direct in the interests of the navigation of said river: Provided further, That ladders suitable for the passage of fish over the said dam shall be constructed and maintained by the said parties, their successors and assigns, as may from time to time be required by the United States Fish Commissioner: Provided further, That in case any litigation arises from the obstruction of the channel by the said dam, or works appurtenant thereto, that the same may be tried in the courts of the United States having proper jurisdiction.

Sec. 2. That this act shall become null and void unless the dam herein authorized shall be commenced within two years and completed within five years of the date hereof.

Sec. 3. That the right to alter, amend, or repeal this act is hereby expressly reserved.

(Second indorsement)

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ENGINEERS,
Washington, May 5, 1908.

1. Respectfully returned to the Secretary of War, inviting attention to an amended draft of the bill which reaches the original purpose and also embodies certain instructions received by the Chief of Engineers.

2. It is recommended that the amended draft be transmitted to the committee with the approval of the War Department.

A. MACKENZIE,
Brigadier General, Chief of Engineers,
United States Army.

(Third indorsement)

WAR DEPARTMENT, *May 6, 1908.*

Respectfully returned to the chairman Committee on Commerce, United States Senate, inviting attention to the foregoing report of the Chief of Engineers, United States Army, and to the accompanying copy of amended bill referred to.

3091 The department concurs in the views of the Chief of Engineers.

ROBERT SHAW OLIVER,
Acting Secretary of War.

(Fourth indorsement)

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ENGINEERS,
Washington, May 20, 1908.

1. Respectfully returned to the Secretary of War.

2. The Chief of Engineers has no further suggestions to make and recommends that all papers be transmitted to the Senate Committee on Commerce.

A. MACKENZIE,
Brigadier General, Chief of Engineers,
United States Army.

(Memo.—The above-mentioned call of the committee was returned and is not now on file.)

A [illegible]L PERMITTING THE BUILDING OF A DAM OR DAMS ACROSS NEW RIVER

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That J. J. Mott, a resident of Radford, in the State of Virginia, his heirs, executors, and assigns, be, and he is hereby authorized to construct and maintain a dam or dams across the New River, extending from Burton Station, a point in Giles County on New River in said State, through Pulaski and Montgomery Counties in said State, to Hiwassa, on New River, Pulaski County, including Fall Branch Falls, Ingle Falls, Pepper Falls, Barretts Falls, and Dry Branch Falls, and all works incident thereto, in accordance with the provisions of an act entitled "An act to regulate the construction of dams across navigable waters," approved June first, nineteen hundred and six: Provided, That in acting upon plans for the structures herein authorized, consideration shall be given by the War Department to the bearing of the said structures upon a comprehensive plan for the improvement of the New River, and the full development of water power: And provided further, That the Secretary of War and the Chief of Engineers shall, in accordance with the aforesaid act of June twenty-first, nineteen hundred and six, as a part of the conditions and stipulations therein contemplated, provide for improving and developing navigation, and fix such charge or charges for the
3092 privilege granted as they deem necessary for the present
and future interests of the United States, the proceeds of such charge or charges to be applied to the improvement of navigation: And provided further, That, in pursuance of the provisions of sections four and six of said act, the Secretary of War is authorized and directed, in case the grantees at any time fail to comply with any of the requirements of this act, or of the aforesaid act of June twenty-first, nineteen hundred and six, or with any of the stipulations or conditions prescribed in pursuance of these acts, to revoke the privileges herein granted and to declare the grant void, without prejudice to the equities of the grantee at the time of revocation, and in addition thereto, the right to revoke by act of Congress at any time after fifty years the rights, privileges, and benefits conferred by this act, is hereby expressly reserved, but in the event of such revocation by Congress, the United States shall pay to the owners of said dam and appurtenant works, as full compensation, the reasonable value thereof, exclusive of the value of the franchise hereby conferred, such reasonable value to be determined by mutual agreement between the Secretary of War and the owners of said

properties, and in case they can not agree, then by proceedings instituted in the United States Circuit Court for the condemnation of such properties.

SEC. 2. Unless extended by act of Congress, all the rights and privileges hereby conferred shall terminate at the end of ninety-nine years from the date of approval of this act, unless sooner revoked as hereinbefore provided, and in the event of such termination, unless renewed by Congress, payment shall be made in the manner and to the amount provided as aforesaid.

(Memo.—The committee call referred to below was returned and is not now on file.)

(Second indorsement)

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ENGINEERS,
Washington, May 5, 1908.

1. Respectfully returned to the Secretary of War, inviting attention to the accompanying draft of a bill which reaches the original purpose and also embodies certain instructions received by the Chief of Engineers.

3093 2. It is recommended that the amended draft be transmitted to the committee with the approval of the War Department.

(H. R. 20246, Sixtieth Congress, first session)

A BILL PERMITTING THE BUILDING OF A DAM OR DAMS ACROSS NEW RIVER, VIRGINIA

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That J. J. Mott, a resident of Radford, in the State of Virginia, his heirs, executors, and assigns, be, and he is hereby, authorized to construct and maintain a dam or dams across the New River, extending from Burton Station, a point in Giles County, on New River, in said State, through Pulaski and Montgomery Counties, in said State, to Hiwassa, on New River, Pulaski County, including Fall Branch Falls, Ingle Falls, Pepper Falls, Barretts Falls, and Dry Branch Falls, and all works incident thereto in accordance with the provisions of an act entitled "An act to regulate the construction of dams across navigable
3094 waters," approved June first, nineteen hundred and six: Provided, That in acting upon plans for the structures herein authorized, consideration shall be given by the War Department to the bearing of the said structures upon a comprehensive plan for the improvement of the New River and the full development of water power: And provided further, That the Secretary of War and the Chief of Engineers shall, in accordance with the aforesaid act of June twenty-first, nineteen hundred and six, as a part of the conditions and stipulations therein contemplated, provide for improving and developing navigation, and fix such charge or charges for the privilege granted as they may deem necessary for the present and future interests of the United States, the proceeds of such charge or charges to be applied to the improvement of navigation: And provided further, That, in pursuance of the provisions of sections four and six of said act, the Secretary of War is authorized and directed, in case the grantees at any time fail to comply with any of the requirements of this act, or of the aforesaid act of June twenty-first, nineteen hundred and six, or with any of the stipulations or conditions prescribed in pursuance of these acts, to revoke the privileges herein granted and to declare the grant void, without prejudice to the equities of the grantee at the time of revocation; and in addition thereto, the right to revoke by act of Congress at any time after fifty years the rights, privileges, and benefits conferred by this act, is hereby expressly reserved, but in the

event of such revocation by Congress, the United States shall pay to the owners of said dam and appurtenant works, as full compensation, the reasonable value thereof, exclusive of the value of the franchise hereby conferred, such reasonable value to be determined by mutual agreement between the Secretary of War and the owners of said properties, and in case they can not agree, then by proceedings instituted in the United States Circuit Court for the condemnation of such properties.

SEC. 2. Unless extended by act of Congress, all the rights and privileges hereby conferred shall terminate at the end of ninety-nine years from the date of approval of this act, unless sooner revoked as hereinbefore provided, and in the event of such termination, unless renewed by Congress, payment shall be made in the manner and to the amount provided as aforesaid.

3095 UNITED STATES ENGINEER OFFICE,
Wheeling, W. Va., April 18, 1908.

Brig. Gen. A. MACKENZIE,
Chief of Engineers, United States Army, Washington, D. C.

GENERAL: 1. I have the honor to submit the following report in compliance with first indorsement on E. D. 67022.

2. The smallest known discharge of the New River at the point referred to is about 700 cubic feet per second. The minimum discharge available for eight months of the year is about 1,880 cubic feet per second. Assuming an efficiency of 78 percent for the wheels and no allowance for locking or leakage, there would be about 167 horsepower available for eight months and a minimum of 62 horsepower during the remaining months for each foot of head.

3. There are a number of falls in this part of the river, ranging up to about 8 feet in height, and the general slope of the river is about 4½ feet per mile. No estimate of the actual horsepower is possible without some knowledge of the number and height of the proposed dams.

Very respectfully,

F. W. ALTSTAETTER,
Captain, Corps of Engineers.

(S. 6409. Sixtieth Congress, first session)

A BILL PERMITTING THE BUILDING OF A DAM OR DAMS ACROSS NEW RIVER

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That J. J. Mott, a resident of Radford, in the State of Virginia, his heirs,

executors, and assigns, is hereby authorized to construct and maintain a dam or dams across the New River, extending from Burton Station, a point in Giles County on New River in said State, through Pulaski and Montgomery Counties in said State, to Hiwassa, on New River, Pulaski County, including Fall Branch Falls, Ingle Falls, Pepper Falls, Barretts Falls, and Dry Branch Falls, and all works incident thereto, including deflection of water from main channel and return to the channel where desired in the utilization of the power to be thereby developed, in accordance with the provisions of an act entitled "An act to regulate the construction of dams across navigable waters,"
3096 approved June first, nineteen hundred and six.

HOUSE OF REPRESENTATIVES,
Washington, D. C., March 26, 1912.

SECRETARY OF WAR, *Washington, D. C.*

DEAR SIR: I would like to know whether the records of your department show if during the present administration, or any prior administration, the right to dam New River was given to one Dr. Mott, or the Appalachian Power Co., or to any other person.

New River runs into my district, and certain large dams are now being constructed thereon. I understand that it is claimed on the part of the persons constructing these dams that they have some sort of license, or permit, from the Secretary of War.

Some years ago a bill was introduced in Congress for the purpose of giving Dr. Mott the exclusive right to dam New River between Burton in Giles County, to Hiawassie, in Pulaski, but this bill was defeated in the committee.

Any information along the above line will be appreciated.

Yours very truly,

E. W. SAUNDERS.

(Second indorsement)

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ENGINEERS,
Washington, April 1, 1912.

1. Respectfully returned to the Secretary of War.

2. It does not appear from the records of this office that authority has been granted by Congress for the construction of a dam in New River, Va., by Dr. Mott or the Appalachian Power Co.

3. By acts of Congress, approved June 4, 1900 (34 Stats. L., 264), authority was granted F. H. Frees and W. C. Ruffin to

construct a dam across New River in Grayson County, Va., and by acts approved February 28, 1911, authority was granted the Virginia Iron, Coal & Coke Co. (36 Stats. L., 921) and the Ivanhoe Furnace Corporation (36 Stats. L., 992), to erect dams near Fosters Falls and at Ivanhoe, Wythe County, Va., respectively.

3097 4. I recommend that Mr. Saunders be so informed with the further information that since New River is an interstate stream, the authority of Congress must, under the law, be obtained for construction of a dam therein, and that the plans therefor must receive the approval of the Chief of Engineers and Secretary of War before the work of construction is begun, but such approval has not been obtained in the cases mentioned.

W. H. Bixby,
Chief of Engineers, United States Army.

War Department,
Washington, April 4, 1912.

Dear Sir: Referring to your letter of 26th ultimo, asking to be advised whether War Department records show that Dr. Mott or the Appalachian Power Co. have ever secured permission to dam New River, Va., I beg to inform you that the Chief of Engineers, United States Army, to whom the matter was referred, reports under date of 1st instant as follows:

"By acts of Congress approved June 4, 1900 (34 Stats. L., 264), authority was granted F. H. Frees and W. C. Ruffin to construct a dam across New River in Grayson County, Va., and by acts approved February 28, 1911, authority was granted the Virginia Iron, Coal & Coke Co. (36 Stats. L. 921), and the Ivanhoe Furnace Corporation (36 Stats. L., 992), to erect dams near Fosters Falls and at Ivanhoe, Wythe County, Va., respectively."

As New River is an interstate stream, the authority of Congress must, under the law, be obtained for the construction of a dam therein, and plans therefor must receive the approval of the Chief of Engineers, United States Army, and the Secretary of War before any work of construction is begun. Such approval has not been obtained in either of the cases above referred to Dr. Mott or the Appalachian Power Co.

Very respectfully,

Robert Shaw Oliver,
Assistant Secretary of War.

Hon. E. W. Saunders,
House of Representatives.

3098

War Department,
United States Engineer Office,
Wheeling, W. Va., November 23, 1912.

From: Maj. F. W. Altstaetter, Corps of Engineers, U. S. A.
To: The Chief of Engineers, U. S. Army, Washington, D. C.
Subject: Water-power dams, New River.

1. In the laws of the United States relating to the improvement of rivers and harbors, published in 1907 at the Government Printing Office, in volume 2, page 909, is an act authorizing the construction of a dam across the New River, with the requirement that the dam should be built within five years. There is nothing on record in this office to indicate that there was ever any correspondence with the Chief of Engineers concerning this act.

2. In 1908 a bill for water-power dam on the upper New River was passed and referred by the Chief of Engineers to this office for remark, in first indorsement dated March 4, 1908 (E. D. 67022). This office made a few remarks about the amount of water power available, after which there was no further correspondence with the Chief of Engineers in the matter.

3. A third bill was passed authorizing a dam across the upper New River, and was referred by the Chief of Engineers to this office for report, in first indorsement dated June 7, 1910 (E. D. 76304), after which there was no further correspondence with the department.

4. There is an Appalachian Power Co. which has the project for six power dams in this upper river, two of which are already completed.

5. This office is exercising no form of supervision over any of these dams; nor is it known whether any other office is doing so. It is quite possible that no supervision is required by this or any other district office, but it was thought best to call the attention of the Chief of Engineers to the matter.

F. W. Altstaetter.

(First indorsement)

Office Chief of Engineers,
December 5, 1912.

To Maj. Altstaetter:

1. It appears from the records of this office that the only acts authorizing the construction of dams across New River, Va.
3099 and W. Va., are one approved June 4, 1900, authorizing the erection of such structures by F. H. Fries and W. G. Ruffin, and two approved February 18, 1911, giving similar privilege to the Ivanhoe Furnace Corporation and to the Virginia Iron, Coal & Coke Co.

2. Plans for these dams have not been submitted to nor received the approval of the department, nor have they been for any other similar structures. By reference to the aforesaid act of June 4, 1900, it will be noted that no duty in connection with the original plans appears to have been committed to the department, but it is considered that under the provisions of section 9 of the river and harbor act of March 3, 1899, approval of the plans should have been obtained from the department prior to beginning the work of construction.

3. The act of June 4, 1900, expired by limitation on June 4, 1905, and any dam built under authority thereof prior to the latter date would be illegal for the reason that plans were not presented to and approved by the department in accordance with section 8 of the act of March 3, 1899. Any dam built subsequent to June 4, 1905, would, of course, be illegal for the same reason and for the additional reason that the act of authorization had become null and void.

4. The two acts approved February 18, 1911, provide that the dams shall be constructed, maintained, and operated in accordance with the general dam act of June 23, 1910, which requires the submission of plans to the department for examination and approval, and also fixes a time limit of one year for commencing the structures. These acts have, therefore, apparently expired by limitation, and any structures built thereover would be unlawful for the reasons above stated.

5. It is not known whether the project of the Appalachian Power Co., to which Maj. Altstaetter refers, has any relation to the aforesaid acts, but if it has, its prosecution is clearly without authority of law. It may be that this company is proceeding on the theory that the upper river being unnavigable the consent of Congress for the building of its projected dams is not required. This, of course, is a question that would ultimately
3100 require judicial determination, and the legal right of this company would depend upon the facts as to whether the dams interfered with navigation or injuriously affected the navigable condition or capacity of the stream.

6. In the absence of approval by the department on plans for the structures no duty in connection with supervision of construction would be assigned to the district officer; but when operations of this character are known by the district officer to be in progress, he should make a careful investigation with a view to ascertaining all the facts and of deciding whether action against the company should be instituted.

By order of the Acting Chief of Engineers.

E. N. Johnston,
Captain, Corps of Engineers.

(Second indorsement)

UNITED STATES ENGINEER OFFICE,
Wheeling, W. Va., March 7, 1913.

To the CHIEF OF ENGINEERS, United States Army.

1. This office has had some correspondence with the Appalachian Power Co. since the above letter was written, and I have had a conference with one of their representatives. While very courteous in their dealings with this office, this company seems desirous of taking up the matter in Washington. A recent letter from this company to this office contains the following:

"Because the basic principles as to which there is contention have country wide application and affect other properties, this matter has been taken up congressionally and with the Office of Chief Engineers, United States Army, our representative being Gen. Geo. H. Harries, vice president of H. M. Byllesby & Co.

"Gen. Harries (who has just returned from Washington), informs me that consideration is now being given to a suggestion that by friendly litigation, carried to the Supreme Court of the United States, there be secured a definite judicial determination of all the questions at issue. This procedure is essential because there are now no decisions sufficiently definite to afford sure guidance either to the Government or the investor."

2. It is assumed that this matter for the present is being handled by the department direct, and no further action will be taken by this office in this case unless further instructions are received.

F. W. ALTSTAETTER,
Major, Corps of Engineers.

3101 (Third indorsement)

OFFICE CHIEF OF ENGINEERS,
March 22, 1913.

To Maj. ALTSTAETTER.

1. The matter referred to in second indorsement hereon has not been taken up with the department by the company except in an informal way.

2. The only way to get it before the Supreme Court is to take action on some concrete case, and action in accordance with the instructions in first indorsement hereon should be taken regardless of any statement made to the district officer by the company.

By command of the Chief of Engineers.

E. N. JOHNSTON,
Captain, Corps of Engineers.

(House of Representatives, Committee on Accounts, Washington)

HUNTINGTON, W. VA., *August 10, 1908.*

SECRETARY OF WAR, *Washington, D. C.*

SIR: I inclose you letter from H. F. Staley, at Bluefield, W. Va. I will be glad if you can give him the information asked for in this letter, and return me this letter when you have done so.

Very truly yours,

J. A. HUGHES.

(Inclosure returned and not on file.)

(Second indorsement)

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ENGINEERS,
Washington, August 26, 1908.

1. Respectfully returned to the Secretary of War.

2. New River being a navigable water not wholly within the limits of a single State, authority to construct a dam across the navigable portions thereof must be obtained from Congress and the plans and location of the structure approved by the Chief of Engineers and the Secretary of War before construction is begun, as required by the provisions of section 9 of the river and harbor act of March 3, 1899.

3. The provisions of this section of law apply to the portion of the river in the vicinity of Lurich.

3102 4. I recommend that Mr. Hughes be so advised for the information of his correspondent, and that the inclosure be returned as requested within.

W. L. MARSHALL,
Brig. Gen., Chief of Engineers,
United States Army.

WAR DEPARTMENT,
Washington, August 29, 1908.

DEAR SIR: I have the honor to acknowledge the receipt of your letter of the 10th instant, inclosing a communication addressed to you by Mr. H. F. Staley, of Bluefield, W. Va., requesting information regarding the water rights of New River, from Lurich about 2 miles downstream; also with reference to damming said river for the purpose of securing power.

Replying thereto I beg to inform you that New River being a navigable water not wholly within the limits of a single State the authority to construct a dam across the navigable portions thereof must be obtained from Congress and the plans and location of the structure approved by the Chief of Engineers, United States Army, and the Secretary of War before construction is begun, as required by the provisions of section 9 of the river and harbor act of March 3, 1899. The provisions of this section of the law apply to that portion of the river in the vicinity of Lurich.

The letter of your correspondent is returned herewith, as requested.

Very respectfully,

Luke E. Wright,
Secretary of War.

Hon. J. A. Hughes,
Huntington, W. Va.

Graham, Va., *December 12, 1910.*

Mr. Frank Pierce,
Acting Secretary, Department of the Interior,
Washington, D. C.

Dear Sir: Please accept my thanks for your favor of November 30, in reference to the New River water power, with papers of the Geological Survey.

3103 My object in writing was chiefly to learn the Government's attitude in such matters, supposing the New River to be under Government control, and the requirements to be met in obtaining the right to develop a water-power plant on New River.

Will you please inform me as fully as possible the requirements of the Government in this connection, and oblige,

Yours, respectfully,

Walter Graham.

Department of the Interior,
Washington, December 15, 1910.

Mr. Walter Graham, *Graham, Va.*

Dear Sir: In reply to your letter of December 12:

The Interior Department has no control over streams outside of the public land States. I am therefore unable to furnish the information desired in regard to New River.

The Chief of Engineers, United States Army, has control over the navigable rivers of the country and if the portion of New River in which you are interested has been designated as navigable, it would come under his jurisdiction. Your letter has been referred to the Chief of Engineers for reply.

Very respectfully,

R. A. Ballinger, *Secretary.*

War Department,
Office of the Chief of Engineers,
Washington, December 20, 1910.

Mr. Walter Graham, *Graham, Va.*

Sir: 1. Your letter of the 12th instant addressed to the Secretary of the Department of the Interior, in reference to construction of a water-power plant on New River, Va., has been referred to this office for reply.

2. There is inclosed herewith for your information a pamphlet
of laws enacted by Congress for the preservation and pro-
3104 tection of navigable waters, your attention being invited
to section 9 of the river and harbor act of March 3, 1899,
also to the accompanying copy of a general dam act approved June 23, 1910. There is also inclosed a rule of the department to be observed by parties making application for approval of plans for a bridge, which is applicable to similar requests relating to dams except that the plans for such structures should be submitted in quadruplicate instead of in triplicate.

By direction of the Chief of Engineers.

Very respectfully,

E. N. Johnston,
Captain, Corps of Engineers.

(Second indorsement)

War Department, Chief of Engineers,
Washington, January 13, 1910.

1. Respectfully returned to Mr. Hill, inviting attention to section 9 of the river and harbor act of March 3, 1899, printed in the accompanying pamphlet, relative to constructing dams over navigable waters; also to a copy of a general dam act enacted by Congress and approved June 21, 1906.

2. There is also inclosed for your information a rule of the department, to be observed by parties making application for approval of plans for a bridge, which is applicable to similar requests relating to dams, except that the plans for such structures should be submitted in quadruplicate instead of triplicate.

By direction of the Chief of Engineers.

J. B. Cavanaugh,
Major, Corps of Engineers.

(Above letter of Mr. Geo. H. Hill returned and not now on file.)

(Second indorsement)

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ENGINEERS,
Washington, January 19, 1910.

1. Respectfully returned to the Secretary of War.

2. The accompanying bill, H. R. 17848, Sixty-first Congress, second session, to authorize the construction of a dam across New River near Foster Falls, Wythe County, Va., is in
3105 the usual form, and its provisions are believed to be satisfactory so far as the interests of navigation are concerned.

3. At the location named in the bill, New River is capable of little navigation, and its future improvement is not likely to be attempted by the United States. While surveys have been made, and some portions of the river have been improved by authority of Congress, operations were indefinitely suspended many years ago, and there is no present or prospective navigation that would be injured by the passage of the bill.

4. As the question of fixing a time limit and exacting the payment of a royalty to the United States for the exercise of a privilege of this kind has been extensively considered by Congress during recent sessions, it is deemed appropriate to invite attention to the fact that provision is not made for these requirements in this bill, and it is understood that provision for imposing such requirements is not contained in the general dam act of June 21, 1906. Without venturing any opinion on the merits of the proposition or the propriety of its adoption, I beg to suggest that if Congress considers such requirements desirable they should be provided for in express terms in the bill, or appropriate amendment should be made to the aforesaid general dam act.

W. L. MARSHALL,
Chief of Engineers, United States Army.

(The call of committee referred to herein returned and not on file.)

(H. R. 17848, Sixty-first Congress, second session)

A BILL TO AUTHORIZE THE VIRGINIA IRON, COAL AND COKE COMPANY TO BUILD A DAM ACROSS THE NEW RIVER NEAR FOSTER FALLS, WYTHE COUNTY, VIRGINIA

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Virginia Iron, Coal and Coke Company, a corporation organized under the laws of the State of Virginia, its successors and assigns, be, and they are hereby, authorized to construct, main-

tain, and operate a dam across the New River at a point near Foster Falls, Wythe County, in the State of Virginia, in accordance with the provisions of the Act entitled "An Act to regulate the construction of dams across navigable waters," ap-
3106 proved June twenty-first, nineteen hundred and six: *Provided*, That the actual construction of said dam shall be begun within two years and completed within five years from the date of the passage of this Act.

SEC. 2. That the right to alter, amend, or repeal this Act is hereby expressly reserved.

(Second indorsement)

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ENGINEERS,
Washington, January 19. 1910.

1. Respectfully returned to the Secretary of War.

2. The accompanying bill, S. 5248, Sixty-first Congress, second session, to authorize the construction of a dam across New River near Foster Falls, Wythe County, Va., is in the usual form, and its provisions are believed to be satisfactory so far as the interests of navigation are concerned.

3. At the location named in the bill, New River is capable of little navigation, and its future improvement is not likely to be attempted by the United States. While surveys have been made, and some portions of the river have been improved by authority of Congress, operations were indefinitely suspended many years ago, and there is no present or prospective navigation that would be injured by the passage of the bill.

4. As the question of fixing a time limit and exacting the payment of a royalty to the United States for the exercise of a privilege of this kind has been extensively considered by Congress during recent sessions, it is deemed appropriate to invite attention to the fact that provision is not made for these requirements in this bill, and it is understood that provision for imposing such requirements is not contained in the general dam act of June 21, 1906. Without venturing any opinion on the merits of the proposition or the propriety of its adoption, I beg to suggest that if Congress considers such requirements desirable they should be provided for in express terms in the bill, or appropriate amendment should be made to the aforesaid general dam act.

W. L. MARSHALL,
Chief of Engineers, U. S. Army.

(The above-mentioned call of committee was returned and is not on file.)

3107 (S. 5248, Sixty-first Congress, second session)

A BILL TO AUTHORIZE THE VIRGINIA IRON, COAL AND COKE COMPANY TO BUILD A DAM ACROSS NEW RIVER NEAR FOSTER FALLS, VIRGINIA.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Virginia Iron, Coal and Coke Company, a corporation organized under the laws of the State of Virginia, its successors and assigns, be, and they are hereby, authorized to construct, maintain, and operate a dam across the New River at a point near Foster Falls, Wythe County, in the State of Virginia, in accordance with the provisions of the act entitled "An act to regulate the construction of dams across navigable waters," approved June twenty-first, nineteen hundred and six: Provided, That the actual construction of said dam shall be begun within two years and completed within five years from the date of the passage of this act.

Sec. 2. That the right to alter, amend, or repeal this act is hereby expressly reserved.

(Second indorsement)

War Department,
Office of the Chief of Engineers,
Washington, February 11, 1911.

1. Respectfully returned to the Secretary of War.

2. The accompanying bill, S. 10676, Sixty-first Congress, third session, to authorize the construction of a dam across New River near Foster Falls, Va., is similar to a bill, S. 5248, Sixty-first Congress, second session, concerning which I had the honor to make report under date of January 19, 1910.

3. At the location named in the bill, New River is capable of little navigation, and its future improvement is not likely to be attempted by the United States. While surveys have been made, and some portions of the river have been improved by authority of Congress, operations were suspended many years ago, and there is no present or prospective navigation that would be injured by the passage of this bill.

4. Moreover, the measure provides that the dam shall be built in
accordance with the provisions of the general dam act of
3108 June 23, 1910, and as that act is understood to contain all
the provisions considered by Congress and the Executive
necessary to safeguard navigation and other interests of the United

States, I see no objection to favorable consideration of the bill by Congress.

W. H. Bixby,
Chief of Engineers, United States Army.

(Memo.—The committee call referred to above was returned and is not now on file.)

(S. 10676, Sixty-first Congress, third session)

A BILL TO AUTHORIZE THE VIRGINIA IRON, COAL AND COKE COMPANY TO BUILD A DAM ACROSS THE NEW RIVER, NEAR FOSTER FALLS, WYTHE COUNTY, VIRGINIA.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Virginia Iron, Coal and Coke Company, a corporation organized under the laws of the State of Virginia, its successors and assigns, be, and they are hereby, authorized to construct, maintain, and operate a dam across the New River, at a point suitable to the interests of navigation, at a point near Foster Falls, Wythe County, in the State of Virginia, in accordance with the provisions of the act approved June twenty-third, nineteen hundred and ten, entitled "An act to amend an act entitled, 'An act to regulate the construction of dams across navigable waters,' approved June twenty-first, nineteen hundred and six."

Sec. 2. That the right to alter, amend, or repeal this act is hereby expressly reserved.

(Second indorsement)

War Department,
Office of the Chief of Engineers,
Washington, February 18, 1911.

1. Respectfully returned to the Secretary of War.

2. I know of no objection to the President's approval of the accompanying H. R. 31922, Sixty-first Congress, third session, "An act to authorize the Virginia Iron, Coal & Coke Co. to build a dam across the New River, near Foster Falls, Wythe County, Va."

W. H. Bixby,
Chief of Engineers, United States Army.

3109 WAR DEPARTMENT,
Washington, February 18, 1911.

The PRESIDENT:

In returning herewith H. R. 31922, Sixty-first Congress, third session, being an act to authorize the Virginia Iron, Coal & Coke Co. to build a dam across the New River near Foster Falls, Wythe County, Va., I have the honor to state that there is no objection on the part of this department to the approval of the act.

Very respectfully,

J. M. DICKINSON,
Secretary of War.

(Memo.—The call of committee referred to below was returned and is not on file.)

(Second indorsement)

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ENGINEERS,
Washington, June 18, 1910.

1. Respectfully returned to the Secretary of War.

2. The object of the accompanying bill H. R. 26411 is to authorize the construction of a dam across New River at Ivanhoe, Va., a point where the river is not navigable.

3. So far as the interests of commerce, present or prospective, are concerned, I know of no objection to favorable consideration of the bill by Congress; but I suggest that it be amended to conform to the usual form which Congress has adopted for such measures. The suggested amendments have been indicated in red on the bill.

W. H. BIXBY,
Chief of Engineers, United States Army.

(H. R. 26411, Sixty-first Congress, second session)

A BILL ANTHORIZING THE IVANHOE FURNACE CORPORATION, OF IVANHOE, WYTHE COUNTY, VIRGINIA, TO ERECT A DAM ACROSS NEW RIVER

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Ivanhoe Furnace Corporation, of Ivanhoe, Wythe County, Virginia, be, and hereby is, authorized to construct and maintain a dam across New River at Ivanhoe, Wythe County, Virginia, in accordance with the provisions of an act entitled "An act

3110 to regulate the construction of dams across navigable waters" approved June twenty-first, nineteen hundred and six.

SEC. 2. That the right to alter, amend, or repeal this act is hereby expressly reserved.

(First indorsement)

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ENGINEERS,
Washington, June 7, 1910.

Respectfully referred to Capt. F. W. Altstaetter, Corps of Engineers, for early report.

By command of the Chief of Engineers:

E. N. JOHNSTON,
Captain, Corps of Engineers.

(Second indorsement)

UNITED STATES ENGINEER OFFICE,
Wheeling, W. Va., June 13, 1910.

1. Respectfully returned to the Chief of Engineers, United States Army.

2. So far as is known to this office, the Government has never made any improvement on the New River above Ivanhoe, nor is there any commerce on that part of the river. It is, in fact, in the nature of a mountainous stream in that vicinity and would be difficult to make navigable for any depth.

3. I am informed that there is a fixed dam at Fries, 18 miles up the New River from Ivanhoe.

4. I do not know of any valid objection to building a dam at Ivanhoe, as provided in the bill herewith.

F. W. ALTSTAETTER,
Captain, Corps of Engineers.

(Second indorsement)

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ENGINEERS,
Washington, February 18, 1911.

1. Respectfully returned to the Secretary of War.

2. I know of no objection to the President's approval of the accompanying H. R. 31931, Sixty-first Congress, third session—"An act authorizing the Ivanhoe Furnace Corporation, 3111 of Ivanhoe, Wythe County, Va., to erect a dam across New River."

W. H. BIXBY,
Chief of Engineers, United States Army.

WAR DEPARTMENT,
Washington, February 18, 1911.

The PRESIDENT:

In returning herewith H. R. 31931, Sixty-first Congress, third session, being an act authorizing the Ivanhoe Furnace Corporation, of Ivanhoe, Wythe County, Va., to erect a dam across New River, I have the honor to state that there is no objection on the part of this department to the approval of the act.

Very respectfully,

J. M. DICKINSON,
Secretary of War.

DECLARATION OF INTENTION TO CONSTRUCT A DAM AND OTHER PROJECT WORKS

Curtis, Mallet-Prevost, Colt & Mosle, Counsellors at Law, 30 Broad Street, New York

3116 NEW RIVER DEVELOPMENT COMPANY,
31 NASSAU STREET,
New York, June 25, 1925.

DECLARATION OF INTENTION TO CONSTRUCT A DAM AND OTHER PROJECT WORKS

New River Development Company, a public service corporation organized and existing under and by virtue of Chapter 150 of the Code of Virginia, intending to construct a dam and other project works across, along, over and in New River in the County of Pulaski, State of Virginia, hereby makes and files declaration of its intention so to do, pursuant to the provisions of Section 23 of the Federal Water Power Act and respectfully requests the Federal Power Commission to cause an immediate investigation of such proposed construction to be made.

In compliance with Regulation 7 of the Regulations of the Federal Power Commission, this Declaration of Intention is accompanied by exhibits which are hereby referred to and made a part hereof, as follows:

Exhibit A: Sketch maps showing the stream to be utilized and the approximate location of the project, as follows:

1. Map of Viele, Blackwell & Buck, Engineers, No. A-6836, showing general location of Project on New River;
2. Map of Viele, Blackwell & Buck, Engineers, No. R-7652, showing portion of river immediately affected by Project;
3. Map of Viele, Blackwell & Buck, Engineers, No. R-7656, showing general plan of proposed development.

Exhibit B: A brief description of the Project and its purpose, including data with respect to proposed height of dam, 3117 storage capacity of reservoir, power capacity of the Project and probable effect on present or prospective navigation;

Exhibit C: A statement as to whether, if the Commission finds that the Project will affect the interests of interstate or foreign commerce, the applicant proposes to apply for a permit or a license.

In witness whereof the applicant has caused its corporate name to be hereunto affixed by George N. Tidd, its Vice-President, and its corporate seal to be hereunto affixed and attested by Frank B. Ball, its Secretary, thereunto duly authorized this 25th day of June 1925.

NEW RIVER DEVELOPMENT COMPANY,
By GEO. N. TIDD, *Vice-President.*

Attest:
[SEAL] FRANK B. BALL, *Secretary.*

3118 Exhibit B

DESCRIPTION OF PROJECT OF NEW RIVER DEVELOPMENT COMPANY IN NEW RIVER, VIRGINIA

Under this Project it is proposed to develop for the purpose of generating hydro-electric power the fall in New River from the Norfolk & Western Railroad bridge at Hiawassia, Virginia, to a point near the mouth of Little River, a distance of approximately 20 miles with a fall of 110 feet. The dam is to be located about one mile above Little River or approximately seven miles above the town of East Radford. The development will be formed by a dam across the New River, with the power house in front of the dam fed by short steel penstocks. The dam will be constructed of Cyclopean concrete on solid rock foundations and abutment, and provided with ample flood gates and spillway.

The principal elevations and data pertaining to the project are as follows:

Drainage area	2396 sq. mi.
Water surface at dam site	El. 1730 ±.
High water over dam	El. 1841.
Top of retaining section and intake	El. 1850.
Top of flood gates and flashboards	El. 1840.
Sill of flood gates	El. 1810.
Crest of Spillway	El. 1835.
Height of Spillway section at deepest point	115 ft.
Height of intake section at deepest point	128 ft.
Pond formed by dam about	4,000 acres.
Storage with 10 ft. draft, about	40,000 acre ft.
Installed capacity	60,000 KW or 80,000 HP.
Yearly output	200,000,000 KWH ±.

Eighty percent of all lands and water rights required for the development have already been purchased by or for the Company.

3119 There is no navigation in this section of the River, except ferry travel which will not be interfered with by the development, nor is there any navigation for approximately 160 miles below the proposed development. The proposed Project will be constructed and operated so as not to impair the navigable capacity of the stream below, nor to affect the interests of interstate or foreign commerce.

The foregoing description of Project of New River Development Company is a part of the Declaration of Intention made by the undersigned this 25th day of June 1925.

NEW RIVER DEVELOPMENT COMPANY,
By GEO. N. TIDD, *Vice-President.*

Attest:
[SEAL] FRANK B. BALL, *Secretary.*

Exhibit C

STATEMENT WITH REFERENCE TO APPLICATION FOR PERMIT OR LICENSE

If the Commission should find that the Project will affect the interests of interstate or foreign commerce the Board of Directors of the Declarant Company, immediately upon receipt of advice to such effect, will consider and determine whether
3120 the Declarant proposes to apply for a permit or for a license.

This statement is a part of the Declaration of Intention made by the Undersigned this 25th day of June 1925.

NEW RIVER DEVELOPMENT COMPANY,
By GEO. N. TIDD, *Vice-President.*

Attest:
[SEAL] FRANK B. BALL, *Secretary.*

3121 *Government exhibit No. 89*

1926, Aug. 30—Assignment of Declaration of Intention of New River Development Co. to Appalachian Electric Power Co. (Original Exhibit.)

3122 *Government exhibit No. 90*

APPALACHIAN ELECTRIC POWER COMPANY

APPLICATION TO FEDERAL POWER COMMISSION FOR LICENSE (UNDER ACT OF JUNE 10, 1920) FOR DEVELOPMENT NO. 6, NEW RIVER A MAJOR PROJECT IN THE STATE OF VIRGINIA

1. Appalachian Electric Power Company, a corporation organized and existing under and by virtue of the laws of the State of Virginia, and having its office and principal place of business at

the City of Richmond, in the State of Virginia, does hereby make application to the Federal Power Commission for a license for a project described herein and shown on general and detailed maps signed by applicant on the 30th day of August, 1926, which maps are filed herewith and made a part hereof, said license to authorize the construction, operation and maintenance of certain project works, the principal ones of which are designated as follows on said maps:

(a) Dam and Reservoir.—Concrete dam, height 110 feet, across
New River. Reservoir approximately 19 miles long cre-
3123 ated by dam. Surface area of Reservoir approximately
4,000 acres.

(b) Water Conduits.—Turbines will be connected to intakes by steel penstocks imbedded in retaining section of dam.

(c) Power House.—Power House will be a brick and steel structure containing 4 and possibly 5—15,000 K. W. alternating current generators.

(d) Transmission lines.—Power is generated at 13,200 volts 60 cycles, and is conducted into the transmission system already in operation located outside of project boundary about 500 feet from Power House.

2. The location of the project applied for is as follows:

(a) In the State of Virginia;

(b) In the County of Pulaski;

(c) On the following named stream: New River. Navigable and carrying commerce to the following extent: None, but tributary to the Kanawha River, which is navigable and carrying commerce up to Montgomery, W. Va., 155 miles below the project.

(d) In the region of the following named cities and towns: Radford, Virginia; Pulaski, Virginia.

3. The proposed scheme of development for project is as follows:

A concrete dam across New River 1627 feet long made up as follows:

	Length	Max. height
	Feet	*Feet*
South retaining section	240	100
Intake section	210	128
Spillway section	715	115
Flood gate section	282	72
North retaining section	180	42

South of the main dam a small dyke will be required about 300 feet long and 30 feet high.

The spillway allows for 6 feet overflow for a length of 675 feet and the gate section contains 4 flood gates 30′ x 50′.

3124 Power house is adjacent to and below south end of dam and will comprise 4 or possibly 5, 20,000 H. P. vertical shaft turbines driving 15,000 K. W. 60 cycle generators. Turbines will have steel scroll cases connected to intakes by steel penstocks imbedded in retaining section of dam. The operating head will range from 100 to 110 feet.

4. The proposed market for the power to be developed is as follows:

All power which can be generated will be fed to an interconnected transmission system now in operation, which passes the proposed project site, and is connected with an operating network which is already generating approximately 300,000 K. W. by steam and water power and rapidly increasing. Network is interconnected from Ohio down to North Carolina.

All power generated can be utilized as soon as available.

5. The location and capacity of all power projects owned or operated by the applicant, the markets supplied thereby and the relation thereof to the Project applied for, are briefly described as follows:

	Location	Capacity
Glen Lyn Steam Plant	Glen Lyn, Virginia	85,000 K. W.
Cabin Creek Steam Plant	Cabin Creek, West Va	83,200 K. W.
Logan Steam Plant	Logan, West Va	40,000 K. W.
Kenova Steam Plant	Kenova, West Va	16,750 K. W.
Back Water Creek Steam Plant	Lynchburg, Virginia	3,000 K. W.
Walnut Avenue Steam Plant	Roanoke, Virginia	7,000 K. W.
Slack Street Steam Plant	Charleston, West Va	8,450 K. W.
Hazard Steam Plant	Lothair, Kentucky	16,000 K. W.
Sprigg Steam Plant	Sprigg, West Va	7,500 K. W.
Byllesby Hydro Plant	Byllesby, Virginia	18,000 K. W.
Buck Hydro Plant	Buck, Virginia	6,210 K. W.
Reussens Hydro Plant	Lynchburg, Virginia	4,500 K. W.
Niagara Hydro Plant	Roanoke, Virginia	2,926 K. W.
Total		298,536 K. W.

The foregoing include all the plants of the applicant and its subsidiary companies.

Applicant, together with its subsidiary companies, supplies electric energy to the western portion of Virginia, the southern half of West Virginia and the eastern portion of Kentucky.

The total K. W. H. output of applicant's system for the year 1925 was approximately 860,000,000 K. W. H. This output
3125 of electric energy was used in the various industrial communities in Virginia and West Virginia and Kentucky, a large proportion of the coal in this region being mined thereby and many chemical works being operated thereby, in addition to the service of light and power to many cities and communities.

The project applied for will, upon completion, become part of the above described system and will supply additional electric energy which is demanded by the territory served.

6. The following exhibits are filed herewith and are hereby made a part of this application:

Exhibit A: Certified copy of Organization papers;

Exhibit B: Other evidence that Applicant is qualified to proceed with the Project applied for;

Exhibit C: Statement re field notes of Project boundary;

Exhibit D: Statement re applicant's compliance with requirements of laws of State of Virginia;

Exhibit E: Statement of nature, extent and ownership of water rights;

Exhibit F: Statement of nature, extent and ownership of lands;

Exhibit G: Statement concerning financial ability of applicant to carry out project applied for;

Exhibit H: Statement of effect of Project on stream flow;

Exhibit I: Estimate of power capacity of project;

Exhibit J: General map covering the entire project area;

Exhibit K: Detail map covering entire project area;

Exhibit L: General design drawings of principal structures and appurtenant works;

Exhibit M: General descriptions and specifications of mechanical, electrical and transmission equipment;

Exhibit N: Estimate of cost of developing project;

Exhibit O: Statement of time desired for completing construction of project works.

In witness whereof the applicant has caused its name and corporate seal to be hereunto signed and affixed by N. M. 3126 Argabrite, its Vice-President thereunto duly authorized, this 30th day of August, 1926.

APPALACHIAN ELECTRIC POWER COMPANY,

APPLICATION FOR LICENSE—APPALACHIAN ELECTRIC POWER COMPANY

CERTIFIED COPY OF ORGANIZATION PAPERS

Organization papers of the applicant are submitted herewith, as Exhibit A, as follows:

1. Copy of Articles of Association of Appalachian Electric Power Company, filed in the office of the Secretary of the Commonwealth of Virginia, March 4, 1926, certified by the Secretary of the Commonwealth of Virginia.

2. Copy of Merger Agreement, Appalachian Electric Power Company, Appalachian Power & Light Company and Appalachian Power Company, filed in the office of the Secretary of the Commonwealth May 1, 1926, certified by the Secretary of the Commonwealth of Virginia.

This statement is a part of the application for license made by the undersigned this 30th day of August, 1926.

APPALACHIAN ELECTRIC POWER COMPANY,
By (S) N. M. ARGABRIT, *Vice-President.*

3164 Exhibit D—Pursuant to Regulation 4, Section 4

APPLICATION FOR LICENSE—APPALACHIAN ELECTRIC POWER COMPANY

STATEMENT RE APPLICANT'S COMPLIANCE WITH REQUIREMENTS OF LAWS OF STATE OF VIRGINIA

Applicant is a corporation duly organized and existing under the laws of the State of Virginia, with powers to construct, maintain and operate works, including all kinds of water, electric and other power plants, to be used for public service in the business of a general electric lighting and power corporation, with all the rights, powers, and privileges of such corporations under the laws of the State of Virginia. Such rights and powers include statutory right and power to acquire by condemnation, in the event the applicant cannot agree with the owners upon terms of purchase, all lands and rights, including rights as to bed and banks of the stream, necessary to construct, maintain and operate the project applied for.

There are no other requirements of the laws of the State of Virginia with respect to bed and banks and with respect to the right to engage in the developing, transmitting, and distributing of power and in any other business necessary to effect the purposes of the license applied for, which need be complied with by the applicant.

This statement is a part of the application for license made by the undersigned this 30th day of August 1926.

APPALACHIAN ELECTRIC POWER COMPANY,
By N. M. ARGABRITE, *Vice-President.*

Exhibit E—Pursuant to Regulation 4, Section 5

APPLICATION FOR LICENSE—APPALACHIAN ELECTRIC POWER COMPANY

3165 STATEMENT OF NATURE, EXTENT AND OWNERSHIP OF WATER RIGHTS

Under Virginia law water rights pertain to the riparian owners, on nonnavigable streams such as New River. Applicant and its predecessors in interest have been engaged for many years past in negotiation for the purchase of riparian lands and appurtenant water rights required for the project applied for and has acquired by purchase approximately eighty percent (80%) of the necessary riparian lands, with appurtenant water rights. It has proceeded, as far as practicable, in perfecting its rights to use sufficient water for proper operation of the project works and has found that it will be necessary to institute condemnation proceedings to acquire the balance of the necessary water rights.

There exists in Virginia no State agency authorized or empowered to give a certified statement setting forth the extent and validity of the applicant's water rights.

No approval or permission of any State agency is required by Virginia law as a condition precedent to the applicant's right to take or use water for the operation of the project works.

This statement is a part of the application for license made by the undersigned this 30th day of August 1926.

APPALACHIAN ELECTRIC POWER COMPANY,
By N. M. ARGABRITE, *Vice-President.*

Exhibit F—Pursuant to Regulation 4, Section 6

APPLICATION FOR LICENSE—APPALACHIAN ELECTRIC POWER COMPANY

STATEMENT OF THE NATURE, EXTENT AND OWNERSHIP OF LANDS

Approximately 80% of the total acreage of lands required for the construction and operation of the project, includ-
3166 ing all land within the project area, has already been acquired by the Applicant. The Applicant plans to acquire the balance of the necessary lands by condemnation proceedings under the laws of the State of Virginia and or under the Federal Water Power Act.

The applicant at the time of filing this application has acquired the right to occupy and use lands owned by others as follows:

Acquired from	Date	Nature of right	Term	Expiration of term
S. T. Rigney, et ux	4/12/24	To submerge lands	Perpetual	
Bruce Clark, et ux	3/11/25	To submerge lands	Perpetual	
F. E. Roope	9/19/23	Railroad right-of-way	Perpetual	
H. L. Flagg, et ux	9/19/23	Railroad right-of-way	Perpetual	
W. C. Flinchun, et ux	9/19/23	Railroad right-of-way	Perpetual	
W. A. Earhart	9/21/23	Railroad right-of-way	Perpetual	
Bd. Supervisors, Pulaski County	6/22/25	To submerge lands	Perpetual	

This statement is part of the application for license made by the undersigned this 30th day of August, 1926.

Exhibit G—Pursuant to Regulation 4, Section 7

APPLICATION FOR LICENSE—APPALACHIAN ELECTRIC POWER COMPANY

STATEMENT CONCERNING FINANCIAL ABILITY OF APPLICANT TO CARRY OUT PROJECT APPLIED FOR

Applicant is a going concern, owning and operating, directly and through subsidiary corporations, extensive electric light and power properties in the States of Virginia, West Virginia, and Kentucky.

Applicant's capitalization is substantially as follows:

	Outstanding with public
Funded Debt:	
Underlying Divisional Bonds	$23,991,000
3167 First and Refunding Mortgage Gold Bonds 5% Series of 1956	35,000,000
Appalachian Power Company 6% Gold Debentures	4,000,000
6% Note due on or before April 1, 1929	5,000,000
Capital Stock (no par value):	
Preferred Stock, $7 Cumulative	225,000 Shares
Second Preferred Stock, $7 Cumulative	100,000 Shares
Common Stock	5,000,000 Shares

Earnings for the twelve months ending February 28, 1926 derived from properties now owned by the applicant and its subsidiary corporations were substantially as follows:

Gross Earnings	$15,380,631
Operating Expenses, Maintenance and Taxes	7,474,502
Net Earnings	$7,906,129
Annual Interest Requirements on Underlying Divisional Bonds held by the Public	$1,249,550
$35,000,000 First and Refunding Mortgage Gold Bonds	1,750,000
	2,999,550
Balance available for other charges, renewals and replacements reserves, dividends, etc	$4,906,579

It has recently marketed an issue of $35,000,000 First and Refunding Mortgage Gold Bonds (included in the capitalization above set forth) on a 5.20% yield basis. Its financial resources are deemed sufficient to finance the project applied for, which is designed to form one of the production units of applicant's system, the development of which is in response to the growth of an already existing consumers' demand for electric energy.

This statement is a part of the application for license made by the undersigned this 30th day of August 1926.

3168 Exhibit H—Pursuant to Regulation 4, Section 8

APPLICATION FOR LICENSE—APPALACHIAN ELECTRIC POWER COMPANY

STATEMENT OF EFFECT OF PROJECT ON STREAM FLOW

Proposed reservoir will back up water for approximately 19 miles above dam. Surface area of reservoir about 4,000 acres. Storage with 10 foot draft on reservoir 40,000 acre feet.

The minimum flow proposed to be released during periods of low water shall be such amount as shall be required for the purposes of power, navigation, flood control and municipal water supply. The proposed ponding of water will tend to equalize seasonal variations, to increase the minimum flow during low water periods and reduce flood peaks below the project.

This statement is a part of the application for a license made by the undersigned this 30th day of August 1926.

APPLICATION FOR LICENSE—APPALACHIAN ELECTRIC POWER COMPANY

ESTIMATE OF POWER CAPACITY OF PROJECT

Estimate of power capacity of the project is the continued product of:

A. The factor, 0.08.

B. The average static head in feet, viz, 106 feet; and

C. The water supply in cubic feet per second and not in excess of the hydraulic capacity of the approved project works, estimated (from duration curve) to be available from net flow or from storage, or from both, for 90% of the time, viz, 1,200, equals 10,176 H. P.

3169 Data upon which such estimate is based is attached hereto and submitted herewith, viz: Duration curve, marked Exhibit I-A. (for static head, see Exhibit L-4).

A list of all sources of power for the system of which the project will be a part is set forth in Exhibit A-5, hereto attached, to which reference is hereby made.

This statement is a part of the application for license made by the undersigned this 30th day of August 1926.

SIXTH ANNUAL REPORT OF THE FEDERAL POWER COMMISSION

FISCAL YEAR ENDED JUNE 30, 1926

3177 Seventy-seventh meeting, held in the office of the Secretary of War, March 2, 1926

Meeting called to order at 3.45 p. m.

Present: Secretary Davis, chairman, Secretary Work and Secretary Jardine, members of the commission; O. C. Merrill, executive secretary; Maj. Glen E. Edgerton, chief engineer; Maj. Paul S. Reinecke and D. J. Guy, assistant engineers; Maj. Lewis W. Call, chief counsel; and William V. King, chief accountant.

The meeting was devoted in part to a public hearing on the declaration of intention of the New River Development Co. to construct a power project on New River about 7 miles above East Radford, Va. Attorneys for the declarant were heard by the commission in appeal from the tentative conclusion of the executive secretary that the project would affect the interests of interstate or foreign commerce. The Attorney General and the counsel for the corporation commission of the State of Virginia also appeared in opposition to the assumption of jurisdiction over the project by the Federal Power Commission.

A report of the hearing made by Douglas O. Morgan, shorthand reporter, is in the files of the commission.

At the conclusion of the hearing, the commission took up the regular order of business in executive session.

Seventy-eighth meeting, held in the office of the Secretary of War, March 26, 1926

Meeting called to order at 4.15 p. m.

Present: Secretary Davis, chairman; Secretary Work and Secretary Jardine, members of the commission; O. C. Merrill, executive secretary; Maj. P. S. Reinecke, assistant chief engineer; Maj. Lewis W. Call, chief counsel; J. F. Lawson, assistant attorney; and William V. King, chief accountant.

The commission then took up the regular order of business in executive session.

The record of the proceedings of February 27, 1926, and March 2, 1926, was approved.

The executive secretary presented a list of three applications, Nos. 697, 698, and 699, received since the meeting of March 2, 1926, and stated that three projects had been advertised.

Authorization for license—Declaration of intention

The executive secretary submitted the following statement: The New River Development Co., of New York City, organized under the laws of Virginia, on June 26, 1925, submitted a declaration of intention to the Federal Power Commission under the provisions of section 23 of the Federal water power act, covering the proposed construction of a dam and water power project across New River, in Pulaski County, near Radford, Va.

The New River rises in North Carolina, flows through Virginia and West Virginia, and 155 miles below the proposed dam in conjunction with the Gauley River forms the Kanawha River, a navigable waterway of the United States. The proposed power project includes a concrete dam about 115 feet high with provision for raising its crest 5 feet by means of flashboards. The reservoir formed by the dam will be about 20 miles long, 3178 will have an area of 3,500 to 4,000 acres, and will have a storage capacity of more than 100,000 acre-feet of water.

The declaration of intention was referred to the Chief of Engineers for investigation and report. A report unfavorable to the contentions of the declarant was made, and at its request the papers were returned to the Chief of Engineers for the consideration of additional data furnished by the declarant. After reconsideration of the question, the Chief of Engineers reported that "so far as can be predicted from available data and records it would not be possible to operate the proposed project so as to adversely affect navigation on the Kanawha River under the existing project."

After study of the case by the commission's staff and the consideration of additional data not before the Chief of Engineers the declarant was informed that it was proposed to recommend to the commission that it find that the proposed project would affect the interests of interstate and foreign commerce. The attorneys for the declarant thereupon requested a hearing before the commission, which hearing was held on March 2. No new data were presented at the hearing, but arguments were made and briefs filed covering not only legal considerations but also the facts upon which the staff of the commission had reached its tentative conclusions.

The matter now comes before the commission for action, and the following review is submitted:

The greater part of the report of the Chief of Engineers is taken up with a discussion of whether New River is or is not a navigable stream. He concludes that it is not. In view of the fact that the navigability of the stream is at least doubtful is denied by the declarant, and in consequence a declaration of intention has been filed, the commission need not pass upon the question of navigability, over the determination of which it has been given no specific authority under the law, but may proceed to act upon the declaration as such under the duty imposed upon it by section 23 of the Federal water power act.

The second paragraph of section 23 of the act, respecting declarations of intention is as follows:

That any person, association, corporation, State, or municipality intending to construct a dam or other project works across, along, over, or in any stream or part thereof, other than those defined herein as navigable waters, and over which Congress has jurisdiction under its authority to regulate commerce between foreign nations and among the several States, may in their discretion file declaration of such intention with the commission, whereupon the commission shall cause immediate investigation of such proposed construction to be made, and if upon investigation it shall find that the interests of interstate or foreign commerce would be affected by such proposed construction, such person, association, corporation, State, or municipality shall not proceed with such construction until it shall have applied for and shall have received a license under the provisions of this act. If the commission shall not so find, and if no public lands or reservations are affected, permission is hereby granted to construct such dam or other project works in such stream upon compliance with State laws.

Before the enactment of the Federal water power act authority to construct dams on navigable streams could be secured only by an act of Congress. There was no means of determining prior to actual erection and operation whether a dam on other streams would or would not affect the interests of commerce. Protection could be had, therefore, only by applying for legislative authority. It was to cure this situation that the provisions of section 23 as above quoted were included in the act. These provisions had two purposes: (1) To protect the interests of navigation by controlling the erection and operation of structures which might otherwise be injurious, rather than by abating the structures or compelling modification in their operation after they are 3179 erected; and (2) to protect applicants by providing a means whereby they can have an authoritative ruling before investment is made.

In the case of United States v. Rio Grande Dam & Irrigation Co. (178 U. S. 770), the Supreme Court said:

> The jurisdiction of the general Government over interstate commerce and its natural highways vests in that Government the right to take all needed measures to preserve the navigability of the navigable water courses of the country.

In discussing the act of September 19, 1890 (26 Stat. 454), subsequently amended in March, 1899, which prohibits "the creation of any obstruction, not affirmatively authorized by law, to the navigable capacity of any waters in respect to which the United States has jurisdiction," the court said:

> It is not a prohibition of any obstruction to navigation, but any obstruction to the navigable capacity, and anything, wherever done or however done, within the limits of the jurisdiction of the United States, which tends to destroy the navigable capacity of one of the navigable waters of the United States is within the terms of the prohibition.

When Congress, through the medium of the Federal water power act, fixed the conditions under which dams might be erected under its jurisdiction and empowered the Federal Power Commission to authorize such erection, it by so doing placed upon the commission the responsibility of taking "all needful measures to preserve the navigability of the navigable water courses of the country" in such cases. Where the stream was not navigable, or the effect upon navigation was in doubt, Congress gave prospective developers the option of having the relation of the project to navigation determined before construction by filing a declaration of intention with the commission, or of having such relation determined after construction through proceedings which might be instituted by the United States. But Congress did not give the Commission the option of directly or indirectly authorizing the erection of a dam with intent of having its effect upon navigation determined by other agencies after construction instead of by the commission before construction. The language of the act itself and the discussions upon it in Congress evidence the intent of Congress to place upon the commission and upon nobody else the duty of determining, when declarations of intention are filed, the effect of the proposed construction upon navigation, and to authorize the commission to waive the requirements of a license only when it is convinced that the project will not, in fact, either in its construction or in its operation affect the interests of interstate or foreign commerce.

There is no merit in the contentions made by the representatives of the declarant in their briefs and arguments that the commission is bound by the report and conclusions of the Chief of Engineers, on the ground either that the War Department is the authority to which the development and protection of navigable waters have been confined by Congress, or that the War Department is the sole investigating arm of the Federal Power Commission in matters affecting navigation. As stated above, whatever may be the provisions of other or earlier legislation, Congress in the Federal water power act placed upon the commission the responsibility of determining the effect of power dams on interstate and foreign commerce, a responsibility which it can not legally pass on to some other agency. If this were not so, there would have been no occasion for the declarant's appearance before the commission.

The act provides that "the work of the commission shall be performed by and through the Departments of War, Interior, and Agriculture, and their engineering, technical, clerical, and other personnel, except as may be otherwise provided by law." It does not provide that any particular work shall be performed by any specified agency. The commission may, if it wishes, make its investigations of the effect of dams on navigation through individuals in the Agricultural or Interior 3180 Departments. Furthermore, the act provides for the detail by the President to the commission of an officer from the Engineer Corps to serve the commission as engineer officer. If the opinion on an engineer question of any individual were to be binding upon the commission, it would appear to be that of the officer detailed as its engineering adviser.

Since the close of the hearing representatives of the declarant have advanced the contention that since they failed to present at the hearing any evidence in support of their position other than the revised report of the Chief of Engineers, the commission in reaching its decision can give no consideration to any information or opinion from any other source. Even if the record before the commission did not contain data and conclusions other than this report of the Chief of Engineers, it would be competent for the commission, if it were not satisfied with the information before it, to secure any other or further information it might wish, whether or not presented at the hearing, and whether or not in the record of the case. The declarant was given a hearing. It was for the declarant to make its own case and to present whatever evidence it might wish. The hearing was ex parte. The declarant can not, by failure to produce evidence in rebuttal of what it knew the record contained, cause that evidence to be excluded from consideration by the commission. Furthermore, evidence other than the revised report of the Chief of Engineers is considered and argued in the briefs filed by the declarant as part of the record of the hearing.

Proceeding to a consideration of the reports and facts in the case which bear upon the question of the effect of the proposed power development upon navigation: In his first report of August 20, 1925, the Chief of Engineers said:

> This river is one of the principal tributaries of the Kanawha River, which has been improved for about 90 miles by the construction of 10 locks. It is really the Kanawha River under another name, and the flow if not properly regulated could have an adverse effect on navigation during low water stages in the Kanawha River. * * *
>
> To fully protect the interests of interstate or foreign commerce any license granted should be made subject to the following conditions:
>
> 1. That the licensee shall permit a continuous flow past its dam not less than the low-water flow of the stream as determined by the records of the stream gauging stations required by the preliminary permit, subject to such modifications as the Secretary of War may prescribe in the interests of navigation, and shall

not at any time interfere with the natural flow of the river to such an extent as to interfere with or impede navigation.

2. That the operations of the licensee, in so far as they affect the use, storage, and discharge of the river shall be controlled by such reasonable rules and regulations as the Secretary of War may prescribe in the interests of navigation.

Subsequently, the chief of engineers reported:

So far as can be predicted from available data and records it would not be possible to operate the proposed project so as to adversely affect navigation on the Kanawha River under the existing project.

The opinion of the Chief of Engineers with respect to lack of effect of the New River project upon navigation appears to be based upon two considerations: (1) That the drainage area below the proposed dam would alone supply "the necessary water for navigation on the Kanawha River under the existing project," and (2) that the character of the stream bed is such "that any periodic fluctuations in flow due to normal operations of the project works would be so attenuated by the time they had reached the Kanawha River 155 miles distant as to preclude the probability of any adverse effect upon navigation on that river."

With respect to the first consideration named: From records received and published by the United States Geological Survey, it
appears that the monthly mean flow past the proposed dam,
3181 which controls 27.5 per cent of the total drainage area
above lock 2 on the Kanawha, has ~~been in~~ times of low
water 40 per cent or more of the total available at lock 2, with the percentage greater as the aggregate flow is less. Leakage alone through the locks and dam at lock 2 is estimated at 700 cubic feet per second, an amount greater than would be available in certain months were the water from the area above the proposed dam shut off. It is the opinion of the district engineer in charge of the Kanawha that approximately 1,100 cubic feet per second is needed for satisfactory operation of the Kanawha locks and dams. This amount might not be available for periods of two or more months, should the declarant fill its reservoir for the first or subsequent times under such run-off conditions as prevailed in September and October of 1902. This, however, is not the primary consideration in the possible effect of the use of storage capacity upon navigation. The most serious effects are likely to be caused by variations in river discharge during critical river stages.

In his revised report of December 29, 1925, the Chief of Engineers says, "There is no known method of computing with any degree of accuracy the effect of fluctuations in flow at the dam on the stage of the river at various distances below the dam." He concludes, however, that under the conditions which it is assumed will obtain on the New River there is no probability of adverse effect on the Kanawha arising from variations in discharge from the power plant.

No actual data have been presented by representatives of the declarant to support their position. They have stated that the operation of existing plants on the New River does not show that variations in power plant discharge cause material variation in flow in the river; but they have submitted no data to support the statement. Their reliance is placed wholly upon the theoretical computations, which the Chief of Engineers correctly says have no value, upon the personal opinion of their own engineers supported by no data, and upon the statement of the Chief of Engineers that "so far as can be predicted from available data and records" there would be no adverse effect on navigation. The only evidence of real value would be actual measurements of variation upon the New River itself or upon some other comparable stream.

Subsequent to the receipt of the Chief of Engineer's revised report the staff of the commission secured detailed records showing the effect of variations in power plant discharge upon the flow of the Pit and Sacramento Rivers in California. The records cover a distance of 125 miles from the Pit No. 3 plants of the Pacific Gas & Electric Co. to Red Bluff on the Sacramento River 71 miles below the mouth of the Pit.

The data plotted on a uniform scale for four gauging stations show conclusively that quantitative variations in river discharge persist over long distances. The data were submitted to representatives of the declarant for their information and they have attempted to reply to them in their brief with the claim that the only portion of the stream covered by the diagram which is comparable with the New River is the 80-mile section from the Ydalpom gauge on the Pit to the Red Bluff gauge on the Sacramento. Of these 80 miles, 71 are on the main Sacramento River having a flatter slope than the New River. An examination of the diagram will show that for the 41 miles on the Pit between plant No. 3 and Ydalpom the quantitative variations in discharge are practically unchanged, and that in the 80 miles on the lower Pit and Sacramento 70 per cent of the variations still persist at Red Bluff.

If daily fluctuations of considerable magnitude are created in the Kanawha they will require at low stages of the river frequent operation of the movable dams, a use for which the dams are not intended, thereby increasing the difficulty and expense of maintaining conditions suitable for navigation, if not making it impracticable.

A plant producing 60,000 kilowatts (the proposed installation, at a head of 100 feet) with an efficiency of 85 per cent will require a maximum flow of about 8,300 cubic feet per second.
3182 If operated on a "normal" load factor, the minimum flow used would be about one-third of the maximum, or 2,800 cubic feet per second, a daily variation of 5,500 cubic feet per second. If, on the other hand, as is becoming more frequently the practice, and as the proposed installation in the New River plant indicates, the plant should be operated as a "peak load" plant in connection with steam installation, it might be closed down entirely during certain periods of the day, causing an extreme variation in daily discharge of the full 8,300 cubic feet per second. If these variations are quantitatively reduced in the degree indicated on the Sacramento River—that is, with about one-third of the variation at the head of each 80-mile section disappearing in that section—the amount of the variation which would persist at the first lock on the Kanawha might vary from 2,000 to 4,000 cubic feet per second, according as the plant was operated on "normal" load factor or on "peak." Even if only one-third of the variation remains, the daily variations at lock 2 might still be from 1,500 cubic feet per second to 2,800 cubic feet per second.

The movable dams on the Kanawha River are usually kept up until the flow reaches approximately 6,000 cubic feet per second and then lowered. Should daily variations of from 1,000 cubic feet per second to 2,000 cubic feet per second be caused when the normal flow is in the vicinity of 6,000 cubic feet per second, constant raising and lowering of the dams would be involved, and serious interference with navigation would be caused. Furthermore, navigators are accustomed to note the stage of the stream as they pass a river gauge and to rely on there being no unusual change in the river stage until another gauge is reached. If variations in the flow, such as appear possible from unregulated operation of the storage on the New River should be of sudden and frequent occurrence, considerable damage to tows and to floating plant might readily result.

Experience on the Kanawha River has shown that no depletion of water supply in a dry season can be made without materially increasing the difficulty of maintaining conditions suitable for navigation. The proposed works have ample capacity not only to decrease the flow in the Kanawha River in considerable amount over long periods in the low-water season, but to cause such variation in daily river discharge as seriously to interfere with operation of the navigation facilities. Under such circumstances it is believed to be the duty of the commission "to take all needed measures to preserve the navigability" of the Kanawha River; and that these measures can be taken only by requiring the dam to be constructed under a license containing such condition as will avoid the possibility of serious interference with navigation.

The commission, after discussion, directed that the case with the additional data collected be returned to the Chief of Engineers for further consideration.

3183 FISCAL YEAR ENDED JUNE 30, 1927

3184 Eighty-eighth meeting, held in the Office of the Secretary of War, June 1, 1927

Meeting called to order at 9.25 a. m.

Present: Secretary Davis, chairman; Secretary Work, member of the commission; O. C. Merrill, executive secretary; Maj. Glen E. Edgerton, chief engineer; Maj. Lewis W. Call, chief counsel; J. F. Lawson, assistant counsel; and William V. King, chief accountant.

Decisions on declarations of intention

The executive secretary presented two declarations of intention submitted under section 23 of the Federal water power act upon which action was taken as follows:

1. The executive secretary made the following statement: The New River Development Co., of New York City, organized under the laws of Virginia, submitted on June 26, 1925, a declaration of intention covering the proposed construction of a power development on the New River in Pulaski County, near Radford, Va. Under date of September 2, 1926, Appalachian Electric Power Co., as successor in interest to New River Development Co., submitted an application for license for the project with the request that action upon the declaration of intention be deferred for consideration at the same time as the application for license. Since the investigation of the application for license is now complete and final action now awaits only the applicant's determination of the exact location for the dam, it is recommended that the commission proceed to make finding with respect to the declaration of intention.

The declaration of intention was referred to the Chief of Engineers in the usual manner who reported on August 20, 1925 that the project, if not properly regulated, could have an adverse effect on navigation during the low-water stages in the Kanawha. Subsequently, after reviewing the case at the request of the applicant, the Chief of Engineers reported that "so far as can be predicted from available data and records it would not be possible to operate the proposed project so as to adversely affect navigation on the Kanawha River under the existing project." In reviewing the report of the Chief of Engineers the engineers of the commission had the advantage of certain studies made upon the Pit River in California showing the effect on the discharge of that river of irregular release of water from Pit No. 3 power plant of Pacific Gas and Electric Co. It was the conclusion of the engineers of the commission that these data clearly indicated the probability that adverse effects upon navigation on the Kanawha would be produced by intermittent discharges of water from the proposed power plant of New River Development Co. It was accordingly recommended to the commission that it find that the proposed project would affect the interests of interstate and foreign commerce, and in support of this recommendation a memorandum was submitted which appears at page 133 of the sixth annual report of the commission.

On account of the different conclusions of the executive secretary and the Chief of Engineers, the commission at its meeting of March 26 directed that the case, with the additional data collected, be returned to the Chief of Engineers for further consideration. On July 23, 1926, General Deakyne, Acting Chief of Engineers, reported as follows:

* * * * *

"The previous report of this office, dated December 29, 1925, on the effect the proposed project would have on the navigation in the Kanawha River was based on records of stream flow from 1909 to 1916, inclusive. These records showed that during
3185 the period in question the drainage area below the proposed plant would provide sufficient water to meet the needs of navigation in the Kanawha River. The summer of 1925 was exceptionally dry, and considerable difficulty was experienced in maintaining navigation in the Kanawha River. It appears, therefore, that at long intervals there may be seasons in which the stream flow is smaller than that covered by the years 1909–1916 and during which the run-off from the area below Radford might be inadequate for navigational purposes.

"I therefore report that there is reason to believe that in the future exceptionally dry seasons may occasionally occur during which the proposed project near Radford, if unregulated, might adversely affect the navigable capacity of the Kanawha River."

In view of the importance to navigation interests of determining to what extent variations in river discharge produced by irregular power-plant operation may persist on the stream below the power plant, as was clearly indicated from the records of Pit River, the commission undertook to have studies made on other streams. A report under date of May 2, 1927, from the commission's representative in California of studies made on the Klamath River in that State bears out in full the conclusions reached from the Pit River records. Quantitative variations in river discharge on the Klamath River were reproduced in full 64 miles below the power plant and to approximately 75 percent at a distance of 132 miles.

For the reasons presented by the Chief of Engineers in the above-quoted report, and for the further reason of effect of irregular power-plant discharge as set forth in the memorandum presented to the meeting of March 26 and as confirmed by the report above referred to, it is concluded that the proposed project of New River Development Co. would affect the interests of interstate or foreign commerce, and it is recommended that the commission so find.

The commission thereupon took action as follows:

In the matter of the declaration of intention, under the provisions of section 23 of the Federal water power act, of New River Development Co., a corporation organized under the laws of the State of Virginia, to construct a dam and other structures across and in New River in the vicinity of Radford, Pulaski County, State of Virginia, said dam and other structures being part of a power project proposed to be constructed for the purpose, inter alia, of the development and utilization of power, said declaration having been submitted to the commission under date of June 26, 1925: The commission having caused investigation of such proposed construction to be made and it appearing from such investigation and from reports submitted thereon that said project, unless operated in the interests of interstate or foreign commerce in accordance with the requirements of said act, would have an adverse effect on such interests, but if operated in accordance with such requirements would materially benefit such commerce, thereupon found that said river in the part thereof involved in said declaration is not "navigable waters" within the definition thereof in said act, but that the interests of interstate or foreign commerce would be affected by such proposed construction.

2. The executive secretary stated that S. A. Lawrence, of Cleveland, Ohio, has declared his intention to construct a dam approximately 25 feet high across the North Fork of New River about 248 miles above Kanawha Falls and near Weaversford, in the

County of Ashe, State of North Carolina; that the Chief of Engineers has reported that the proposed project is on a tributary to the Kanawha River, a navigable waterway of the United States, but due to the small capacity of the proposed reservoir and the distance above the head of navigation he believes the project will have no adverse effect on the navigable capacity of the Kanawha River. The executive secretary recommended that the commission find that the interests of interstate or foreign commerce would not be affected by construction of the proposed project.

3186 The commission thereupon took action as follows:

In the matter of the declaration of intention of S. A. Lawrence, of Cleveland, Ohio, to construct a dam across and in North Fork of New River in the vicinity of Weaversford, in Ashe County, N. C., for the purpose of developing power: The commission having caused investigation of such proposed construction to be made and it appearing upon such investigation that said North Fork of New River in said vicinity is not "navigable waters" as defined in the Federal water power act, and that such proposed construction would not affect the interests of interstate or foreign commerce, it was voted that the commission finds that the interests of interstate or foreign commerce would not be affected by such proposed construction.

3187 FISCAL YEAR ENDED JUNE 30, 1928

3188 Ninety-third meeting, held in the office of the Secretary of War, May 28, 1928

Meeting called to order at 11 a. m.

Present: Secretary Davis, chairman; Secretary Work and Secretary Jardine, members of the commission; O. C. Merrill, executive secretary; Maj. Glen E. Edgerton, chief engineer; Maj. Paul S. Reinecke, assistant chief engineer; Maj. Lewis W. Call, chief counsel; J. F. Lawson, assistant counsel; and William V. King, chief accountant.

The record of the proceedings of March 26, 1928, was approved.

The executive secretary presented a list of 19 applications, Nos. 5, 497, 663, 862, and 887 to 901, inclusive, received since the meeting of March 26, 1928; and stated that nine applications had been advertised and two declarations of intention had been received.

* * * * *

Licenses confirmed—Miscellaneous

Secretary Jardine called attention to a request that had been received from Appalachian Electric Power Co. for a reference to the Attorney General of certain questions of law respecting the applicability of the Federal water power act and of the standard form of license issued thereunder to projects on nonnavigable streams. The request in the form of a letter of April 26, 1928, addressed to the commission and inclosing copy of a previous letter of March 1, 1928, is as follows:

APRIL 26, 1928.

(Identical with draft of April 12, 1928)

Hon. DWIGHT F. DAVIS, *Secretary of War;* Hon. HUBERT WORK, *Secretary of the Interior;* Hon. WILLIAM M. JARDINE, *Secretary of Agriculture*, constituting Federal Power Commission.

Subject: Project 739, Virginia Appalachian Electric Power Co.

SIRS: Appalachian Electric Power Co. proposes to construct a waterpower development near Radford, Va., on New River, a stream held by the War Department and the Federal Power Commission to be nonnavigable. The project would be located entirely within the State of Virginia and the nearest navigable waters, those of the Kanawha River to which the New River is a tributary, are in the State of West Virginia and more than 150 miles down-stream from the proposed power site. No land nor other property of the United States is involved.

Under date of March 1, 1928, this company addressed to the Federal Power Commission a request, a copy of which is inclosed herewith, that it issue for this project a license containing provisions limited to those which are relevant for the protection of navigation on the Kanawha River. Discussion of that letter with the executive secretary of the commission has left counsel for the company with the impression that the commission can not accede to the request of the company, in respect at least of the major points thereof.

The company is unwilling to surrender its property and constitutional rights to the extent of accepting a license such as the commission can or proposes to issue; yet it is desirous of commencing the construction of the project at the earliest possible date. Unless, therefore, it is feasible for the commission to
3189 issue a license the terms of which relate solely to naviga-

tion, the company proposes to proceed with the construction of the project without obtaining a license from the Federal Power Commission.

However, the company desires to make it clear that as regards the construction and operation of its proposed development, it is willing to accept all conditions which are reasonably designed to protect the navigability of the waters of the United States and, specifically, is willing to subscribe to, and at all times to be controlled by, any reasonable rules and regulations which the Secretary of War may prescribe in the interests of navigation.

The legal aspects of this case are exceedingly important from the standpoints both of prospective developers of water power on nonnavigable streams and likewise of the commission itself.

The company assumes that it is the policy of the commission to promote and to cooperate with legitimate business and developments of water power. Consequently it appears reasonable that the commission should seek and utilize opinions as to the legal phases of the problem from the Attorney General of the United States.

Under the circumstances, therefore, the company believes that it would be appropriate, and hereby respectfully and earnestly requests, that the commission obtain from the Attorney General of the United States an opinion on the pertinent points, including the following:

1. When under the Federal water power act

(a) A corporation has under section 23 made a declaration of intention;

(b) The commission, upon investigation, has found that the interests of interstate or foreign commerce would not be affected by such proposed construction;

(c) Permission is thereby granted by the commission to construct the project;

(d) At some later time, due either to the construction or operation of the project, there is created an obstruction to the navigable capacity of waters of the United States;

does there remain to the Federal Government a remedy to prevent or regulate the obstruction by proceeding against the company for a violation of the act of March 3, 1899 (30 Stat. L. 1151)?

2. With specific reference to all the facts in the case of Appalachian Electric Power Co., when in the case of a declaration of intention under section 23 of the Federal water power act, the Chief of Engineers of the Army finds in essence that it is problematical and at least uncertain whether the proposed project could or would adversely affect the interests of interstate or for-

eign commerce, may the Federal Power Commission lawfully make a finding that the project (positively) would affect (adversely) the interests of interstate or foreign commerce?

3. With specific reference to all the facts in the case of Appalachian Electric Power Co., the major facts of which are

(a) The company has made a declaration of intention under section 23 of the Federal water-power act;

(b) The commission, upon investigation, has found that "the interests of interstate or foreign commerce would be affected by such proposed construction";

(c) The company has applied for a license;

(d) The commission has tendered to the company a draft of license which it proposed to issue to the company;

(e) The company thereupon has requested that the provisions of the license be limited to such as are reasonable, relevant and appropriate for the protection of navigation;

(f) The commission has notified the company that it can not or is unwilling to issue a license so limited;

in event the company should now proceed with the con-
3190 struction of the project without a license from the Federal
Power Commission, what procedure against the company would then be legally and practically available to the commission and/or the War Department, with special reference to the Federal water power act of June 10, 1920, the act of March 3, 1899, and any other pertinent law?

4. When under section 23 of the Federal water power act a declaration of intention has been filed to construct a project in a stream other than one defined as "navigable waters" by the act, and upon investigation of the proposed construction it is found to be difficult to ascertain in advance and therefore not certain whether the interests of interstate or foreign commerce would be affected by such proposed construction, could the commission refrain from making any finding as to whether the proposed construction would or would not affect the interests of interstate or foreign commerce and thereby leave the jurisdiction of the project to the War Department under the act of March 3, 1899?

In case the commission or the Secretary of War should request such an opinion from the Attorney General, the company respectfully requests that, in certifying any facts of the case to the Attorney General, there be included the above-mentioned letter of the company to the commission dated March 1, 1928, and also that part at least of the letter of the Acting Chief of Engineers of the Army to the executive secretary of the Federal Power Commission, dated July 23, 1926, which reads as follows:

"4. I therefore report that there is reason to believe that in the future exceptionally dry seasons may occasionally occur during which the proposed project near Redford, if unregulated, might adversely affect the navigable capacity of the Kanawha River."

Respectfully yours,

APPALACHIAN ELECTRIC POWER CO.,
By CURTIS, MALLET-PREVOST, COLT & MOSLE.

MARCH 1, 1928.

Hon. DWIGHT F. DAVIS, *Secretary of War;* Hon. HUBERT WORK, *Secretary of the Interior;* Hon. WILLIAM M. JARDINE, *Secretary of Agriculture,* constituting the Federal Power Commission, Washington, D. C.

Subject: Project 739, Virginia Appalachian Electric Power Co.

DEAR SIRS: The engineering and geological investigations which have been carried on for more than a year at the proposed dam and reservoir site for this project have progressed to the point where it seems advisable to consider the license which the Federal Power Commission proposes to issue to Appalachian Electric Power Co.

June 1, 1927, the Federal Power Commission took the following action on the declaration of intention filed by the New River Development Co.:

"In the matter of the declaration of intention, under the provisions of section 23 of the Federal water power act, of New River Development Co., a corporation organized under the laws of the State of Virginia, to construct a dam and other structures across and in New River in the vicinity of Radford, Pulaski County, State of Virginia, said dam and other structures being part of a power project proposed to be constructed for the purpose, inter alia, of the development and utilization of power, said declaration having been submitted to the commission under date of June 26, 1925: The commission having caused investigation of such proposed construction to be made and it appearing from such investigation and from reports submitted thereon that said project, unless operated in the interests of interstate or foreign commerce in accordance with the requirements of said act, would have an adverse effect on such interests, but if operated in accordance with such requirements would materially benefit such commerce, thereupon found that said river in the part thereof involved in said declaration is not 'navigable waters' within
3191 the definition thereof in said act, but that the interests of interstate or foreign commerce would be affected by such proposed construction."

This finding was made even though the project is located on the New River entirely within the confines of the State of Virginia and the nearest navigable waters, those of the Kanawha River to which the New River is tributary, are in the State of West Virginia and more than 150 miles downstream from the proposed power site.

The original declaration of intention was filed by the New River Development Co. June 26, 1925. In a letter dated September 2, 1926, addressed to the Federal Power Commission by Curtis, Mallet-Prevost, Colt & Mosle, attorneys for Appalachian Electric Power Co., there was inclosed a formal assignment to Appalachian Electric Power Co. of the declaration of intention filed by New River Development Co. In the same letter there was also inclosed an application by Appalachian Electric Power Co. for a license for the proposed project. This letter stated that the application for a license was submitted on the understanding that such application could be withdrawn if it should develop that a Federal license would not be required.

On July 1, 1927, the Federal Power Commission forwarded to the office of Curtis, Mallet-Prevost, Colt & Mosle, duplicate copies of the license which it is proposed to issue to this company for a power project in the New River near Radford, Pulaski County, Va.

After careful examination of the provisions of this proposed license, and upon advice of counsel, Appalachian Electric Power Co. has come to the conclusion that the proposed form of license in the present instance either is not authorized by a proper construction of the Federal water power act or, if the construction be proper, is predicated upon an act which is, at least in part, unconstitutional. Appalachian Electric Power Co. is advised that where a license is to be issued under section 23 of the act and where the project is located entirely on nonnavigable waters and utilizes no public lands of the United States, the commission is not authorized to insert in the license any provisions, whether specified by section 10 of the act or not, which go beyond what is reasonable and appropriate to protect the navigable waters of the United States.

The company is not in this case concerned with the validity of the act in so far as it may be applicable to projects on Government lands, upon navigable waters or in the organized territories of the United States. But the company submits that the only authority of Congress, and the only authority which would be deemed to be conferred validly upon the commission in this case, is to protect the navigable capacity of the waters of the United States and that the limit of the commission's power, if it has any power in the premises, is to impose conditions and regulations reasonable and appropriate for that purpose. The insertion of any other provision is, in the company's judgment and in any view of the act, unauthorized or, if it could be deemed as specifically authorized, unconstitutional.

The company submits that the only possible interpretation of the Federal water power act which could in any view be regarded as consistent with its constitutional validity, and which would permit the commission to issue a license to it, would be that such a license should embody neither such provisions or conditions as those which are set forth in section 10 of the act and which have no bearing upon the protection of navigation nor the recapture provision of section 14 of the act. That is to say, the only valid requirement or authority for a license in this case would be for a license the provisions and conditions of which would insure protection of the navigable capacity of the Kanawha River.

Appalachian Electric Power Co. will accept a license containing conditions reasonably and appropriately designed for the protection of the navigable waters of the United States, but it can not accept a license containing terms which are beyond
3192 the authority of the commission to impose. The company
submits that the tendered license contains many provisions wholly unauthorized by any admissible construction of the act in view of constitutional limitation.

In the light of the foregoing, the company desires to call the attention of the commission to certain provisions in the proposed license which has been tendered to Appalachian Electric Power Co.:

The last clause of the preamble and the granting clause found on page 3 of the proposed license are as follows:

"Whereas the licensee, on the day of ____________, pursuant to an authorization of its board of directors, a copy of the record thereof being hereto attached, accepted in writing all the terms and conditions of the act and of this license.

"Now, therefore, the commission hereby issues this license to the licensee for the purpose of constructing, operating, and maintaining certain project works necessary or convenient for the development and improvement of navigation and for the development, transmission, and utilization of power across, along, from, or in said New River and constituting a part of the project hereinafter described; said license, including the period thereof, being subject to all the terms and conditions of the act and of the rules and regulations of the commission pursuant thereto as amended and made effective on the 1st day of April, 1924, as though fully set forth herein, which said rules and regulations are attached hereto and made a part hereof and being subject also to the following express conditions and limitations, to wit:"

Under the proposed wording, the company would be required to place itself in a position where it might be urged that the company would be bound by all the terms and conditions of the act and of the proposed license; moreover, the license contains the statement that the license would be "subject to all the terms and conditions of the act and of the rules and regulations of the commission pursuant thereto." For reasons hereinbefore and hereinafter stated, the company can accept neither all the conditions of the act nor all the rules and regulations of the commission pursuant thereto nor all the conditions of the proposed license. The company is willing, however, to accept such conditions of the act, such rules and regulations of the commission, and such conditions of a license as are reasonable and appropriate for the protection of the navigability of the waters of the United States.

Article 1.—That part of article 1 which reads: "in consideration of such license and the benefits and advantages accruing thereunder to the licensee it is expressly agreed by the licensee that the entire project, project area, and project works as hereinafter designated and described, whether or not located in, on, or along said New River or upon lands of the United States, shall be subject to all the terms and conditions of the act and of the rules and regulations of the commission pursuant thereto and made a part of this license," the company is unwilling to accept. The commission in the present case has no authority to impose this condition, because it would mean, for example, that the company would thereby agree to the recapture provisions of section 14 of the act and other provisions clearly inappropriate and unconstitutional as applied to the project here involved.

Article 2.—It is not apparent that all the conditions of this article are reasonable and appropriate for or relevant to the protection of navigation. Nevertheless, the company raises no objection to this article.

Articles 3 to 5, inclusive.—To the extent that the requirements of these articles are reasonable and appropriate for or relevant to the protection of navigation, the company is willing to accept them.

3193 Article 6.—The company is willing to accept the conditions of this article.

Article 7.—The terms of this article appear to go beyond that which is reasonable and appropriate for the protection of navigation. Nevertheless, the company is willing to accept this article, provided there be omitted from the fourth sentence thereof, the following: "and the ownership or possession, or the right of use and occupancy, of which are subject to acquisition by the United States under the provisions of section 14 of the act."

The company submits that any conditions providing for or referring to the recapture of this project by the United States are wholly unauthorized by the act and beyond the constitutional power of Congress.

Articles 8 to 12, inclusive.—The company is willing to accept the conditions of these articles.

Articles 13, 15, and 16.—Those conditions of these articles which pertain to navigation facilities appear to be relevant only in the case of a project located on a navigable stream, but in the present case, inasmuch as New River in the part thereof involved in this proposed project is not navigable, appear to be irrelevant, inappropriate, and unauthorized. Nevertheless, the company is willing to accept the said conditions.

Article 14.—The company is willing to accept any conditions which are reasonably designed to protect the navigability of the waters of the United States. However, there are certain conditions in this article which appear not to fall in that category.

The first condition of the article, namely: "The United States specifically retains and safeguards the right to use water in such amount to be determined by the Secretary of War as may be necessary for the purposes of navigation," appears to be relevant only in the case of a project on a navigable stream, and therefore, in the present case, appears to be irrelevant, inappropriate, and unauthorized. Nevertheless, the company is willing to accept the said condition.

The company is willing to accept the condition that "the operations of the licensee so far as they affect the use, storage, and discharge from storage of waters affected by this license shall at all times be controlled by such reasonable rules and regulations as the Secretary of War may prescribe in the interests of navigation."

However, the company wishes to point out that the condition reading: "Provided, That the licensee shall discharge at least 9,000 acre-feet of water per week over or through the dam, and whenever the flow at Lock No. 2, Kanawha River, falls below 1,400 cubic feet per second, the licensee shall, unless otherwise authorized by the Secretary of War, discharge in each 24 hours the natural flow of the river entering the reservoir during the same period, such weekly and daily discharges being subject to the reasonable rules and regulations hereinbefore mentioned," seems unreasonable and more stringent than the needs of navigation require.

The condition that "the operations of the licensee. * * * shall at all times be controlled by such reasonable rules and regulations * * * as the Federal Power Commission may prescribe in the interests of flood control" is construed by the company as having reference merely to the protection of navigation and a license containing this condition would be accepted only with such understanding.

The condition of this article in which there is an attempted reservation of authority in the commission to prescribe rules and regulations in the interest "of the fullest practicable use of said waters for power purposes" appears to be irrelevant, 3194 inappropriate, and unauthorized for the protection of navigation. However, inasmuch as the company is in sympathy with any requirement which will provide for the fullest practicable use of the river for power purposes, it is willing to accept the said condition of this article.

Article 17.—The company, like the commission, is desirous that the higher portions of the reservoir area be properly cleared and hence is willing to accept the conditions of this article.

Article 18.—The company can not accept the conditions of this article. It is advised that the commission has, under the circumstances, no authority to impose such conditions and earnestly submits that they should be omitted from any license which the commission issues for this project.

Article 19.—Although the company is advised that there is doubt as to the authority of the commission to require such conditions in a license for this project, the company is sympathetic with the principle that there should be compensation for beneficial storage and hence is willing to accept the conditions of this article.

Article 20.—The company is willing to accept the conditions of this article, but it is suggested that the technical determination of the power capacity be discussed between the engineers of the commission and those of the company. In passing, however, it is desired to point out that the second item of charge specified in the first sentence of this article is irrelevant and without application for the reason that no "lands or other property" of the United States are involved in the project.

Article 21.—The company can not accept the provisions of this article. It is advised that the commission has, under the circumstances, no authority to impose such conditions and earnestly submits that they should be omitted from any license which the commission issues for this project.

Article 22.—The company is willing to subject itself to such of the conditions of this article as are necessary and appropriate for the protection of navigation, but is unwilling to accept such a condition as that which requires that any lease which it may make of the project property shall be subject to "all the conditions of * * * the act and of said rules and regulations of the commission."

Article 23.—The company is willing to subject itself to such of the conditions of this article as are reasonable and appropriate for the protection of navigation, but is unwilling to accept any conditions which are not reasonable or appropriate for the foregoing purpose and instead are predicated upon and refer to the so-called recapture provisions of sections 14 and 15 of the act.

Article 24.—The company is willing to accept that part of article 24 which reads:

"The licensee shall abide by such reasonable regulation of the services to be rendered to customers or consumers of power, and of rates and charges of payment therefor, as may from time to time be prescribed by any duly constituted agency of the State in which the service is rendered or the rate charged."

The rates and services rendered by the company are at this time being regulated by the State of Virginia, and the power of the State to do so has never been doubted. The remainder of article 24 the company is unwilling to accept, for the reason that the commission has no authority to regulate the services, rates,
3195 or securities of this company, whether or not the State should have a commission or other authority for such regulation and control.

Article 25.—The company is willing to accept the conditions of this article.

Article 26.—The company objects to any implication that in accepting a license (in the modified form as proposed herein) it would accept also such provisions of the act and such rules and regulations of the commission as are not relevant, appropriate, or authorized for the protection of navigation.

Despite the foregoing enumeration of specific provisions of the tendered license to which the company has objection, it desires to assure the commission that it is willing to accept every provision which may be reasonable and appropriate for the protection of the interests of the Federal Government in the navigable waters of the United States. At the same time the company insists that there shall be eliminated from the license provisions which are unreasonable and inappropriate to that end. The company trusts that the commission will be willing to cooperate with it and is therefore desirous that it be informed by the commission which, if any, of the objectionable provisions the commission is willing to eliminate, in order that the company may consider the tendered license as modified by such eliminations.

This communication and the expression of the company's willingness to accept a license upon the terms which have been stated are without prejudice to the company's right, in case this proposal is not accepted, to urge the invalidity of the authority claimed by the commission upon any and all grounds including the construction or constitutionality of the act.

Respectfully yours,

APPALACHIAN ELECTRIC POWER CO.,
By CURTIS, MALLET-PRÉVOST, COLT & MOSLE.

After discussion, it was voted that reference of such questions to the Attorney General would not be appropriate and that the commission was of the opinion that modification of the form of license as requested in the letter of March 1 would be in violation of the provisions of the Federal water power act.

At 11.30 a. m. the meeting was adjourned.

O. C. MERRILL, *Executive Secretary.*

3196 FISCAL YEAR ENDED JUNE 30, 1931

3197 One hundred and eighth meeting held in the office of the Secretary of the Interior, November 25, 1930

Meeting called to order at 4.10 p. m.

Present: Secretary Wilbur, acting chairman; Secretary Hyde, member of the commission; F. Trubee Davison, Acting Secretary of War, acting member of the commission; F. E. Bonner, executive secretary; Lieut. Col. M. C. Tyler, chief engineer; J. F. Lawson, acting chief counsel; Chas. A. Russell, solicitor; Maj. F. K. Newcomer, assistant chief engineer; E. C. Bebb, F. F. Henshaw, N. B. Keeler, and R. R. Randell, engineers; Maj. R. Y. Stuart, forester, United States Forest Service; B. F. Heintzleman, assistant regional forester, Alaska,

The executive secretary presented a list of 22 applications, Nos. 863 and 1113 to 1133, inclusive, received since the meeting of August 27, 1930.

* * * * *

Authorizations for licenses

The executive secretary presented applications for licenses, with reports and recommendations thereon, upon which action was taken as follows:

1. The executive secretary stated that a minor-part license application of the Appalachian Electric Power Co. for a development near Radford on New River, a nonnavigable stream, project 739, Virginia, was ready for consideration and that in accordance with the opinion of the Attorney General of September 22, 1930, the commission has full authority to exercise its dis-

cretion in waiving certain provisions under section 10 (i) of the act in connection with any license issued in this case.

After due consideration the commission declined to take action on the application, favorable or adverse. It was concluded that in view of the importance of the questions of jurisdiction as between the United States and the State of Virginia involved in this case a court adjudication is desirable.

One hundred and fifteenth meeting, January 26, 1931

Present: Commissioners Draper, Garsaud, McNinch, Williamson, and Chairman Smith.

Discusssion—Application of Appalachian Electric Power Co.

Col. F. W. Scheidenhelm and Mr. Graham Claytor, representing the Appalachian Electric Power Co., having application for a power project, No. 739, on the New River, appeared before the commission informally urging early action and decision upon their application for a minor-part license.

These gentlemen briefly surveyed the history of their efforts to procure a license and stated that approximately $1,750,000 had been expended in the preliminary work on New River in rebuilding roads, purchasing lands, establishing quarters, and for engineering expenses, and that no further progress could be made until the Federal Power Commission had definitely decided its position in regard to the application.

Reference was made to previous information furnished by Mr. William E. Carson, chairman of the Virginia State Commission on Conservation and Development, to the effect that one 3198 town in the vicinity of this work, and within 3 or 4 miles of the proposed construction, was at the present time, and had been for some weeks, feeding at public expense 500 families; that deaths are actually occurring in the vicinity due directly or indirectly to the inability of the community to care for the people who are out of employment; that the construction work on this project would relieve that situation; and that action upon the application, even through it were adverse to the company's request for license, would improve local conditions.

Individual members of the commission expressed their realization of the importance of early action on the application, but expressed also the opinion that the decision in this case involved so fundamentally the underlying principles of interpretation of the Federal water power act that any action upon the part of the commission would act as a precedent guiding the future acts of the commission and, therefore, due to the extreme importance of the legal questions involved, expressed the view that a public hearing should be had at which time the attorneys for the power company, or any State interested, or any other interested party, would have an opportunity to present, either upon written brief or orally, or both, any arguments which they might desire involving the interpretation of the Federal water power act affecting the granting of minor-part licenses or affecting the jurisdiction of the Federal Power Commission.

It was the consensus of opinion that such hearing, if had, should be held at as early a date as possible and was tentatively set for Monday, February 16, 1931, subject to change at the convenience of the parties interested.

One hundred and sixteenth meeting, January 28, 1931

Present: Commissioners Draper, Garsaud, McNinch, Williamson, and Chairman Smith.

Order for public hearing

The following order was unanimously approved:

It is hereby ordered that a public hearing be held before the Federal Power Commission at 10 a. m., room 5243, Interior Building, February 16, 1931, at which time parties interested can present by oral argument or written brief, or both, any arguments touching upon the request for a license now pending before the Federal Power Commission by the Appalachian Electric Power Co. in connection with its proposed power development upon New River, Va.

It is further ordered that notice of this hearing be immediately sent by wire to the Appalachian Electric Power Co. and also to the governors of the following States who have registered with the commission by letter indications of their interest in this question: Virginia, West Virginia, Tennessee, and Akransas.

One hundred and twenty-third meeting, February 25, 1931

Present: Commissioners Draper, Garsaud, McNinch, Williamson, and Chairman Smith.

The chairman reported that Mr. Judson King had informally requested extension of time for filing his brief in the New River case.

It was voted that Mr. King be told that as February 28 is the limit fixed for the filing of briefs and it is now too late to notify other interested parties of any extension of time, no formal extension is possible, but that his brief will be considered by the commission when received.

3199 One hundred and twenty-sixth meeting, March 10, 1931

Present: Commissioners Draper, Garsaud, McNinch, Williamson, and Chairman Smith.

The chairman reported that supplemental briefs following the public hearing on project 739–Virginia were received before the close of business February 28 from the Appalachian Electric Power Co. by Curtis, Mallet-Prevost, Colt & Mosle; the State of Pennsylvania, by Geo. W. Woodruff, personal counsel to Governor Pinchot, concerning utility matters, and the State of Virginia, by William E. Carson, chairman Virginia Conservation and Development Commission; also, that the brief submitted by Judson King, as director of the National Popular Government League, was received on March 9, the other brief, purporting to come from the same organization and received on February 25, having immediately thereafter been declared by Mr. King as unauthorized and mailed through inadvertence.

One hundred and thirty-fourth meeting, April 3, 1931

Present: Commissioners Draper, Garsaud, McNinch, Williamson, and Chairman Smith.

Opinion and order

In the matter of the Appalachian Electric Power Co., project No. 739, Virginia:

On June 26, 1925, the New River Development Co., predecessor of the Appalachian Electric Power Co., filed a declaration of intention to construct a proposed dam and power project on New River near Radford in the State of Virginia. The declaration of intention was filed under the provisions of section 23 of the Federal water power act (41 Stat. 1063).

On September 2, 1926, the successor company filed formal application for a license for said project, "upon the understanding that such application can be withdrawn if it should develop that a Federal license is not required."

Pursuant to hearings held by the commission on March 2, 1926, and on October 28, 1926, at which time evidence was introduced by the interested parties, the Federal Power Commission, on June 1, 1927, adopted and entered in its minutes the following order:

"In the matter of the declaration of intention, under the provisions of section 23 of the Federal water power act, of New River Development Co., a corporation organized under the laws of the State of Virginia, to construct a dam and other structures

across and in New River in the vicinity of Radford, Pulaski County, State of Virginia, said dam and other structures being part of a power project proposed to be constructed for the purpose, inter alia, of the development and utilization of power, said declaration having been submitted to the commission under date of June 26, 1925; the commission having caused investigation of such proposed construction to be made and it appearing from such investigation and from reports submitted thereon that said project, unless operated in the interests of interstate or foreign commerce in accordance with the requirements of said act, would have an adverse effect on such interests, but if operated in accordance with such requirements would materially benefit such commerce, thereupon found that said river in the part thereof involved in said declaration is not 'navigable waters' within the definition thereof in said act, but that the interests of
3200 interstate or foreign commerce would be affected by such proposed construction."

And, pursuant to said order, on July 1, 1927, tendered to the said applicant a license in standard form.

On February 4, 1930, the applicant company, having previously refused said license, requested the commission to reconsider the finding as made to the effect that the proposed project would affect the interests of interstate or foreign commerce, or in the alternative to issue a minor-part license for this project.

On October 6, 1930, the applicant company applied to the Federal Power Commission for a minor-part license for this project.

On November 25, 1930, the minutes of the Federal Power Commission at it final meeting prior to its reorganization show that—

The executive secretary stated that a minor-part license application of the Appalachian Electric Power Co. for a development near Radford on New River, a nonnavigable stream, project No. 739, Virginia, was ready for consideration, and that in accordance with the opinion of the Attorney General of September 22, 1930, the commission has full authority to exercise its discretion in waiving certain provisions under section 10 (i) of the act in connection with any license issued in this case.

After due consideration the commission declined to take action on the application, favorable or adverse. It was concluded that in view of the importance of the questions of jurisdiction as between the United States and the State of Virginia involved in this case a court adjudication is desirable.

The present Federal Power Commission, organized on December 22, 1930, set a hearing on the matter, and, on February 16 and 17, 1931, the applicant appeared and was duly heard and filed brief.

At the same time Hon. E. Lee Trinkle, for the region in which project is proposed to be constructed in Virginia; William E. Carson, Esq., chairman, Virginia Conservation and Development Commission; E. W. Caffee, Esq., mayor of Pulaski, Va.; F. M. Livezey, Esq., for Public Service Commission of West Virginia; C. R. Luker, Esq., representing Governor of Kentucky; Hon. Roy H. Beeler, representing State of Tennessee; Hon. John H. Caldwell, assistant attorney general of Arkansas; and Hon. Edwin H. Gibson, assistant attorney general of Virginia, appeared and several of said parties submitted briefs in support of the protests of their respective States theretofore filed with the Federal Power Commission objecting to the said commission taking jurisdiction on the said application.

Also there were filed with the commission briefs by George W. Woodruff, personal counsel to Hon. Gifford Pinchot, Governor of the State of Pennsylvania, and by Herbert S. Ward and other counsel for the National Popular Government League in support of the jurisdiction of the commission in the specific instance covered by this application and like instances.

Commissioner McNinch proposed, and Commissioner Draper supported, such proposal, that this commission should reconsider and reverse the finding of the former commission, "that said river in the part thereof involved in said declaration of intention is not 'navigable waters' within the definition thereof in said act."

The majority of the commission is of the opinion that the suggestion does not involve the question of the jurisdiction of this commission over New River, but merely the question of the ground upon which such jurisdiction shall be predicated, and that the ultimate determination of what is "navigable waters" under the Federal water power act in any case is one for the courts and that any finding made by this commission as to what are navigable waters in law would not be binding upon the courts.

It is the judgment of a majority of the commission, in view of the conflicting evidence and opinion as to New River being "navigable waters within the definition of the act," that jurisdiction is more properly based upon section 23 of the act,
3201 applicable to streams of this character where the authority of the commision is clearly defined, leaving to the

courts the determination of the question of "navigable waters as defined in the act."

It is the unanimous opinion of the commission that the evidence clearly sustains the finding that the proposed construction would affect the interests of interstate and foreign commerce. New River is the principal tributary of the Kanawha River and as such in low-water periods supplies the principal part of the flow of the Kanawha River, a navigable stream presently used in interstate and foreign commerce, and the Kanawha River is one of the principal tributaries of the Upper Ohio River, a navigable stream presently used in interstate and foreign commerce. These facts, together with others in the record, support such finding. It is the opinion of this commission that such finding when so based upon valid evidence is conclusive in view of the authority conferred upon this commission by section 23 of the act.

Now, therefore, this commission having reviewed the evidence, records, and files of this office, bearing upon the issues hereinbefore set forth, having heard argument and carefully read the briefs above referred to, and being fully advised in the premises, hereby orders:

1. That the motion of the applicant company to reconsider the finding of June 1, 1927, "that the interests of interstate or foreign commerce would be affected by such proposed construction" be, and the same is hereby, denied;

2. That the application, dated October 6, 1930, for a minor-part license for this project be, and the same is hereby, denied; and

3. That the applicant shall be tendered a standard form license under the act, and it is hereby ordered that it shall not proceed with construction until it shall have received and accepted such license.

Approval of form of license

Commissioner McNinch submitted a form of license for the Appalachian Electric Power Co., project 739–Virginia, and moved its adoption. The motion to adopt was seconded by Commissioner Williamson and approval of the form was unanimously voted.

Commissioner Garsaud was of the opinion that the full text of the findings of the commission of June 1, 1927, should be inserted in the license.

One hundred and fifty-first meeting, May 5, 1931

Present: Commissioners Draper, Garsaud, McNinch, Williamson, and Chairman Smith.

3202 FISCAL YEAR ENDED JUNE 30, 1932

3203 Two Hundred and Third Meeting, October 26, 1931

Present: Commissioners Draper, Garsaud, McNinch, and Chairman Smith.

Resolution

On motion of Commissioner Draper, the following resolution was unanimously adopted:

Resolved, The commission by letter of October 21, 1931, having authorized the Attorney General to raise the issue of navigability of New River in the Appalachian Electric Power Co. case and Assistant Attorney General Seth W. Richardson in a letter to the commission dated October 23, 1931, having requested the commission to proceed without delay in obtaining available evidence upon this issue, the commission hereby delegates to Commissioner McNinch the duty of cooperating with the Department of Justice in discovering and preparing in usable form all evidence obtainable for presentation to the court in support of the Government's contention and in the performance of this task Commissioner McNinch is authorized to use such portion of Acting General Counsel Lawson's time as may be found necessary and all or such part of the time of Attorney Gatchell as he may think necessary. If further assistance is deemed necessary by him from time to time he shall make know such further requirements to the commission with his recommendations in regard thereto.

A Declaration of the Navigability of New River

(Project No. 739)

On October 12, 1932, the following resolution, offered by Commissioner McNinch, and seconded by Commissioner Draper, was adopted by unanimous vote:

Whereas, it has been brought to the attention of the Federal Power Commission that plaintiff, in its brief and on oral argument in the United States District Court before Mr. Justice Luther B. Way, at Norfolk, Va., on July 19, 1932, in the case of the Appalachian Electric Power Co. against George Otis Smith et al., Equity No. 494, stated that the defendants, as members of the Federal Power Commission, did on April 3, 1931, reaffirm and adopt a finding of the predecessor commission dated June 1, 1927, that New River was nonnavigable; and

Whereas it appears from said brief and oral argument of plaintiff's counsel that the position and action of this commission in respect to the said finding of June 1, 1927, by a predecessor commission of the nonnavigability of New River has been misunderstood and the purpose and effect of the action taken by this commission on April 3, 1931, has been construed by plaintiff's counsel contrary to the intent and understanding of this commission of its said action, and this commission desiring to correct such misinterpretation and misunderstanding and to clarify its position in regard thereto;

Does hereby declare that neither this commission, as constituted on April 3, 1931, nor the members of the commission, by the action taken on said April 3, 1931, either adopted or reaffirmed, or intended its action to be understood or interpreted as an adoption or reaffirmation of the finding of the predecessor commission on June 1, 1927, to the effect that New River was non-
navigable, but that on the contrary, as the record of this
3204 commission's action plainly shows, this commission made
no finding as to the navigability or nonnavigability of said New River, as it was of the opinion that it was not required to make any finding upon such question;

That, as a further evidence that this commission did not adopt or reaffirm the finding of nonnavigability of New River by the predecessor commission on June 1, 1927, and did not intend that its action taken April 3, 1931, should be so construed, this commission after plaintiff's bill had been filed did on October 21, 1931, by letter to the Attorney General of the United States authorize the Attorney General to submit the question of the navigability of New River to the courts and expressed its readiness to furnish the Attorney General with such facts and evidence as are obtainable upon this question; that pursuant to authority given in said letter, the first answer of the members of the commission traversed the allegation of plaintiff company to the effect that the present commission had reaffirmed and adopted the finding of the predecessor commission that New River was nonnavigable; and the second answer of the members of the commission averred that said river is navigable, which averment of navigability had the approval of this commission and the members thereof;

And this commission further declares that, in view of the misunderstanding and misinterprtation of the action taken by this commission on April 3, 1931, and of the authority subsequently given to the Attorney General to submit the question of the navigability, of the New River to the courts, and of the answers filed by the Attorney General on behalf of the commission and the members thereof, and upon the whole record and evidence before the commission in this matter on April 3, 1931, including the doctrine of navigability as laid down in numerous cases by the United States Supreme Court, and the records of surveys of New River authorized by Congress, appropriations by Congress for the improvement of New River, official reports to Congress recommending improvement of New River, reports of improvements made upon said river, the report of the Board of Engineers appointed to examine the James River and the Kanawha Canal project, reports by the Chief of Engineers relative to the navigability of New River and the effect of the proposed project on interstate commerce; also reports by the Secretary of War and the Chief of Engineers on the survey of New River, the report of Moore and Briggs upon the survey and navigability of said river, the acts of Congress authorizing construction of dams across New River, permits by the Secretary of War for construction of bridges across said river, and numerous statutes by the States of Virginia and West Virginia recognizing the navigability of the said river;

The commission finds and declares that New River, from the mouth of Wilson Creek, Va., north, is navigable waters within the definition thereof, as set forth in section 3 of the Federal water power act.

Commissioner Williamson concurring:

The action of the commission on April 3, 1931, as given in its written decision, was designed to express the fundamental basis upon which Federal jurisdiction was predicated.

The commission by that action took jurisdiction over New River for the purposes of the Federal water power act. This jurisdiction having been declared and the provisions of the Federal water power act made operative upon the applicant, the commission action was complete, regardless of the reasons given as justification therefor.

Thereafter, action was instituted by the applicant company, after refusal of the tendered license, questioning the jurisdiction of the United States in the premises.

The statement of the former commission, "that said river in the part thereof involved in said declaration is not 'navigable waters' within the definition thereof in said act," can not, in my opinion, be considered as a finding of fact. It was in form, as well as content, merely a conclusion of law. In fact, the present commission did not consider such finding as one of fact, nor
3205
pertinent to the decision of the case, and as not binding upon the courts.

Economy Light & Power Co. v. United States, 256 U. S. 113.

No attempt was made by this commission to pass upon the question of navigability in fact of New River, nor in my opinion was the question of navigability of New River necessarily before either the former commission, or this commission, the statute having been engaged upon a Declaration of Intention by the applicant company filed pursuant to the provisions of section 23 of the act.

The question was as to whether interstate and foreign commerce was affected. Prior to the passing of the Federal water power act the power to make this determination vested exclusively in Congress and its exercise was a function of that body.

Congress has the supreme power to regulate commerce with foreign nations, and among the several States, and with the Indian tribes by virtue of clause 3, section 8, Article I of the Constitution of the United States, and its declarations as to what is or is not necessary to its exercise of this power are beyond the jurisdiction of the courts to question.

In section 23 of the act this power is delegated to the Federal Power Commission, and in the exercise of that authority its decision, lawfully made, as to what will or will not affect interstate commerce, is subject to the same conclusiveness as pertains to Congressional action.

In the instant case there was evidence in the record supporting the commission's finding that the proposed project would affect interstate and foreign commerce and this is sufficient, in my opinion, to protect the finding of the commission against attack.

Crowell v. Benson, 285 U. S. 22.

It not only gives to the commission ample ground upon which to assert its jurisdiction, regardless of navigability in fact, but brings that determination within the body of decision law defining the dignity of such administrative action.

This being the view of the commission, the decision of April 3, 1931, should not be construed as a finding for or against navigability in fact of New River, nor can the existence of the finding of the former commission on June 1, 1927, be legitimately construed as an indication of this commission's view upon the question of navigability in fact.

It was my opinion then, and it is my opinion now, that the ground stated by this commission on April 3, 1931, is not only the strongest legal position the Government can take in support of the jurisdiction of the Federal water power act in this particular case, but is otherwise advantageous to the Government's interest. However, that New River has been navigated and that it is navigable water within tests applied by the court in many cases is clear.

The commission having asserted its jurisdiction and its position now being apparently misunderstood, the issue of navigability so far as it is pertinent to the Government's position should not, in my opinion, be encumbered by any misunderstanding or misconstruction of this commission's former action.

For these reasons I concur in this action.

3206 *Government exhibit No. 92*

1925, Aug. 20—Report of General Taylor, Chief of Engineers on Declaration of Intention for project No. 739.

3207 War Department,
Office of the Chief of Engineers,
Washington, August 20, 1925.

Refer to File No. 7495 (New River Developt. Co.)—3

The Executive Secretary,
Federal Power Commission,
Washington, D. C.

Dear Sir: 1. In reply to your request of July 1, 1925, the following report is submitted on the declaration of intention by the New River Development Company, to construct a power development in the New River, Va., near the town of Radford, Pulaski County, Va.

2. New River rises in the northwestern corner of North Carolina, near the Tennessee line, and flows northeasterly through and between spurs and branches of the Blue Ridge until it reaches the lead mines in Wythe County, Va. From this point it flows in the same general northeasterly direction between and parallel to the main divides of the Blue Ridge and the Alleghenies, cutting alternately through spurs, from the one to the other, until in the fifty-fifth mile of the survey at what is known as the Horseshoe, it turns abruptly to the northwest and breaks through the five ranges into which the Alleghenies are here divided, keeping the same direction to the mouth of the Greenbrier, 73 miles beyond.

3. Commencing at the lead mines with a width of 350 feet and an average depth of 5 feet, the river gradually expands to a width of 900 feet and an average depth of 6 feet, just above the Greenbrier, subject to expansions and contractions normally found in natural watercourses.

4. On its course, between the lead mines and the Greenbrier, New River receives several tributaries of varying size. Among them in the east are Big Reed Island and Big Stony Creeks and Little and Indian Rivers; on the west, Cripple, Reed, Walker's, and Wolfe Creeks and East and Blue Stone Rivers. All of these are mountain streams, furnishing from 50 to 200 c. f. s. of water at ordinary stages.

3208 5. (a) The original project was adopted in 1876, and provided for improving the stream from the Lead Mines in

Wythe County, Virginia, to the mouth of the Greenbrier River in West Virginia, by widening the channel from 30 to 50 feet as might be required, deepening it to two feet and straightening as needed for bateau navigation, the improvement however, to be made in such manner as would aid the work should greater depth and width be required in the future. The sum of $109,691.06 was expended up to June 30, 1898, for open river navigation.

(b) The declaration of intention involves the so-called New River bridge or Middle Division.

(c) Moore & Briggs, in 1819, surveyed 54 miles of the river between Sinking Creek and Greenbrier River under the auspices of the Board of Public Works of the State of Virginia. In their report the statement appears that "not withstanding it was represented to us as being remarkably low it afforded (July, 1819) a superabundance of water for every purpose of internal navigation." They also stated they ascended all the principal falls with their boat.

6. In the report submitted by Major W. P. Craighill, covering a distance of 128 miles of the river, dated Baltimore, Md., December 17, 1872, observations and measurements during unusually low water stages indicated a discharge at the dam of the Wythe Union & Lead Company in Wythe County, Va., of 2,000 c. f. s. and 3,000 c. f. s. at Sifford's Falls, 65 miles downstream, which the report states would indicate that the stream affords abundant water at all seasons for any scheme of navigation improvement that might be adopted.

7. On page 915, Annual Report, Chief of Engineers, for 1882, the following statement appears:

Miles of River Improvement

	1881	Previous	Total
Greenbrier Division	9	17½	26½
New River Bridge Division	10	12	22
Lead Mines Division	5⅓	0	5⅓
	24⅓	29½	53⅚

3209 8. The amount expended during the fiscal year 1881-82, exclusive of outstanding liabilities July 1, 1882, was $28,398.07 (See page 919, Annual Report, C. of E., 1882). On page 702, Annual Report, C. of E., 1883, the following is taken from the report of Lieut. Col. W. P. Craighill, dated Baltimore, Md., May 21, 1883:

Greenbrier, or Lower Division.....Improved 26⅛ miles.
New Bridge, or Middle Division.....Improved 29¼ miles.
Lead Mines, or Upper Division.....Improved 5⅓ miles.

9. At the close of the working season of 1882 there was a channel 50 feet wide and 2 feet deep from Hinton Landing to Wiley's Shoals, a distance by river of 26½ miles; also a channel from New River bridge to the head of Jones Ford, a distance of 21 miles as follows:

12 miles,	30 feet	wide,	2½	feet	deep
2½	"	20	"	"	"	"	"
7½	"	10	"	"	"	"	"

This channel was extended same year 8½ miles above the bridge.

10. Page 236, Annual Report, C. of E., for 1890, the following statement appears regarding the three sections under improvement: "The amount expended in the year ending June 30, 1890, has been $6,394.45 and the total to that date is $109,733.21."

11. On page 506, House Document No. 1491, 63rd Congress, 3rd Session, are found the following data on appropriations for River and Harbor improvement on New River, Va., and West Va.:

August 14, 1876	$15, 000
June 18, 1878	15, 000
March 3, 1879	12, 000
June 14, 1880	24, 000
March 3, 1881	24, 000
October 2, 1882	12, 000
October 5, 1886	10, 000
Total	$112, 000

12. On page 5, House Document No. 1410, 62nd Congress, 3rd Session, the following statement appears: "From Hinton to the vicinity of Glenlyn, a distance of 30 miles, a boat drawing 2 feet will have sufficient depth of water for navigation at practically all times," and on page 6 of same document "From Hinton to Glenlyn, * * * there is some commerce, consisting of lumber, staves, sand, gravel, and also some grain, hay, farm
3210 products, and miscellaneous merchandise."

13. Commerce on the New River during the calendar year 1882 was reported as more than 11,000 tons. Commerce on the Kanawha River, of which the New River is the most important tributary, is reported as follows:

Year	Tons	Value	Passengers	Floated timber[1]	
				Tons	Value
1919	892, 253	$12, 138, 677	2, 267	312	$7, 488
1920	1, 451, 084	9, 304, 983	1, 105	273	2, 138
1921	1, 118, 691	8, 778. 335	2, 768	220	1, 980
1922	942, 451	8, 746, 201	2, 235	157	1, 498
1923	1, 572, 821	7, 828, 786	3, 262	15	135

[1] The tonnage and value of floated timber are not included in the amounts shown in Columns 2 and 3.

14. Hinton is in West Virginia, while Glenlyn is in Virginia, the New River therefore constituting an interstate stream so far as navigation is concerned. The proposed project involves falls, shallows and rapids which would probably compel land carriage.

15. The low water flow of the Kanawha at its junction with the Ohio is estimated as little, if any, less than the flow of the Ohio at the same point.

16. The River and Harbor Appropriation Act of June 13, 1902, repealed the previous acts providing for prosecution of work of improvement of New River, and directed that unexpended funds be paid into the Treasury of the United States. Congress has asserted jurisdiction over the New River in the past by having expended moneys on this stream for channel improvement with the view to improving the entire stream for navigation. Four proposed power developments on New River have been projected since the enactment of the Federal Water Power Act and have been considered as coming within the jurisdiction of the Federal Power Commission. They are—

Project No. 223 W. Va.—Preliminary permit granted to Charles B. Hawley, Washington, D. C., for power development at Sandstone Falls about 90 miles below the proposed project. This permit expired November 5, 1924.

Project No. 379 W. Va. and Va.—Preliminary permit granted the West Virginia Power Company, Charleston, W. Va., for power development at the mouth of the Bluestone River, about 79 miles below the proposed project. This permit is still in force.

3211 Project No. 542 N. C.—Application submitted and pending for preliminary permit for power development on the New and Reddies Rivers in North Carolina about 100 miles above the proposed project.

Project No. 575 Va. and N. C.—Application submitted and pending by the Eastern States Development Company, Wheeling, W. Va., for power development on the New River in Virginia, and the Fisher River in North Carolina, about 50 miles above the proposed project.

17. A. (a) This river is one of the principal tributaries of the Kanawha River, which has been improved for about 90 miles by the construction of 10 locks. It is really the Kanawha River under another name and the flow if not properly regulated could have an adverse effect on navigation during low water stages in the Kanawha River.

(b) The possible adverse effect is not such as to warrant refusal to allow the proposed construction to proceed if control is maintained by the United States.

(c) No action by any other agency of the United States will be necessary or desirable to protect fully the interests of interstate or foreign commerce.

B. (a) Proper regulation of the flow of the river would naturally be of benefit to navigation. The extent of this benefit has not been fully determined.

(b) To fully protect the interests of interstate or foreign commerce any license granted should be made subject to the following conditions:

1. That the licensee shall permit a continuous flow past its dam not less than the low water flow of the stream as determined by the records of the stream gauging stations required by the preliminary permit, subject to such modifications as the Secretary of War may prescribe in the interests of navigation, and shall not at any time interfere with the natural flow of the river to such an extent as to interfere with or impede navigation.

2. That the operations of the licensee, so far as they affect the use, storage and discharge of the river shall be controlled by such reasonable rules and regulations as the Secretary of War may prescribe in the interests of navigation.

18. From the above facts it is established that New River has been under Federal improvement for navigation, that navigation has actually existed and that the river was physically 3212 capable of interstate navigation although very light draft. The fact that navigation does not exist at present is not understood to change the legal status of the stream. Congress has in the past signified its intention to assert jurisdiction of the New River by appropriating money for its improvement with a view to making the stream navigable, and it is not seen that the fact that the reversion to the Treasury of unexpended funds was later ordered alters its status. If free from any control by the United States it would be difficult to ascertain authoritatively that the proposed development would be in general accord with the most beneficial utilization of the water for navigation, water power, flood control and other beneficial public uses. It is obvious that such utilization is essential to the best interests of commerce. Therefore, while the navigable capacity of the stream is limited, this office must report that no sufficient reason is seen why the Federal Power Commission should not exercise jurisdiction over the proposed project.

Very respectfully,

(Signed) H. TAYLOR,
Major General, Chief of Engineers.

Government exhibit No. 93

1925, July 23—Report of District Engineer, Major A. K. B. Lyman and Endorsement (7/25/29) Division Engineer C. W. Kutz, on declaration for project No. 739.

3214

WAR DEPARTMENT,
UNITED STATES ENGINEER OFFICE,
13TH FLOOR, COAL EXCHANGE BUILDING,
Huntington, West Virginia, July 23, 1925.

Refer to File No. M668

Subject: Report on declaration of intention dated June 25, 1925, by the New River Development Company for proposed water-power development in the New River near Radford, Virginia.

To: The Chief of Engineers, U. S. Army, Washington, D. C. (through the Division Engineer, Central Division).

1. Improvements for navigation.—(a) Improvement for navigation have been made on the New River extending from Hinton, West Virginia, to a distance upstream for about twenty-five miles. About $110,000 was expended on the work. The last work was done in 1882, except the expenditure of $10,000 since that date.

(b) Surveys and examinations were made but no improvements on that part of the river involved in this declaration of intention.

(c) The improvements made for navigation in the New River consist of building channel chutes or sluiceways across bars. These channels were about 50 feet wide and 2 feet deep at extreme low water and were improved by cutting out rock where necessary and piling up stones along the sides of chutes to direct water through them.

2. Use of stream.—The stream has been used to a limited extent for transportation of persons and property. This has been limited to the floating of logs and operation of row boats and ferries. The only use made at present of the river for navigation is limited to ferries.

3. Interruption to navigable parts of stream.—The proposed project does not involve falls, shallows or rapids compelling land carriage.

4. Jurisdiction of Congress.—The New River while not navigable in fact is legally a navigable stream, the Government in
3215 the past having expended moneys on this stream for channel improvement. The following proposed developments of water power on New River have been projected since the enactment of the Federal Water Power Law and have been considered as coming within the jurisdiction of the Federal Power Commission:

Project No. 223—W. Va. Preliminary permit granted to Charles B. Hawley, Washington, D. C., for power development at Sandstone Falls. This permit expired November 5, 1924.

Project No. 379—W. Va. and Va. Preliminary permit granted to the West Virginia Power Company, Charleston, W. Va., for power development at the mouth of the Bluestone River. This permit is still in force.

Project No. 542—N. C. Application submitted and pending for preliminary permit for power development on the New and Reddies Rivers in North Carolina.

Project No. 575—Va. and N. C. Application submitted and pending by the Eastern States Development Company, Wheeling, W. Va., for power development on the New River in Virginia and the Fisher River in North Carolina.

5. Effect on commerce.—(a) The proposed water-power development would be a benefit to navigation due to its probable regulation of low-water flow, provided the natural minimum low-water flow be not decreased.

(b) A permit or license for the proposed project should include a provision that the minimum flow immediately below the proposed dam be not less than the average minimum natural low-water flow, which is necessary for the maintenance of the pools above the dams in the Kanawha River, which stream is formed by the junction of the New and the Gauley Rivers.

(c) No action by any other agency of the United States will be necessary or desirable to fully protect the interests of commerce.

6. It is the opinion of this office that the New River is a navigable stream as defined by the Federal Power Act and that the proposed water-power project of the New River Development Company should be considered as coming under the jurisdiction of the Federal Power Commission.

(Signed) A. K. B. Lyman,
Major, Corps of Engineers, District Engineer.

3216 (Views of Division Engineer, Central Division, on Report of the District Engineer, Huntington, W. Va. dated July 23, 1925, on Declaration of intention dated June 25, 1925 by the New River Development Co. for proposed water-power development in the New River near Radford, Va.)

1st Ind.

CWK/a.

Office Div. Engr., Cent. Div., July 25, 1925.

To the Chief of Engineers:

1. The Division Engineer concurs in the opinion of the District Engineer that the reach of New River under consideration comes under the jurisdiction of the Federal Waterpower Commission.

This opinoin is based primarily upon the fact that this reach of river was recommended to Congress for improvement after investigation under its authority, though not actually improved.

(Signed) C. W. KUTZ,
Col., Corps of Engineers, Division Engineer.

Subject: Effect of proposed power dam near Radford, Va. on navigation

Major G. E. EDGERTON, *Chief Engineer,*
FEDERAL POWER COMMISSION, *Washington, D. C.*

DEAR MAJOR EDGERTON: We have prepared the data you requested during your visit here October 10. The inclosed paper is a statement of the effect of the proposed dam of the New River Development Co. on New River near Radford, Va., on the navigation of the Kanawha River. We are also inclosing the memorandum you left here.

Very truly yours,

H. M. TRIPPE,
H. M. Trippe,
Major, Corps of Engineers, District Engineer.

2 inclosures—Statement; Memorandum.

3219 EFFECT ON NAVIGATION OF PROPOSED NEW RIVER DEVELOPMENT CO. PROJECT ON NEW RIVER NEAR RADFORD, VA.

In order to prevent interruption to navigation on the Kanawha River there must be enough discharge in the river to maintain the pools at their normal elevation. This means that the discharge must be equal to or greater than the leakage plus the lockage requirements or the pools will be drawn down and navigation interrupted because of insufficient depth. The movable dams have a greater leakage than the fixed dams; hence their pools are the hardest to maintain.

During periods of occasional low water great difficulty is encountered in maintaining these pools. It is necessary to calk the wickets with timbers, brush, cinders, weeds, straw, manure, etc., to seal the spaces between the wickets. The past low water season, July, August and September, 1925, was the driest of record and in spite of the utmost care exercised it was impossible to maintain the pools of the movable dams up to normal. The natural flow of the river was not sufficient to provide for the leakage and the water required for lockages at any of the dams, fixed or movable. If the river discharge is decreased below the amount which occurred during the past season navigation would be proportionately restricted.

A table of the discharge records of the 1925 low water period and the 1914 low water period follows. The 1914 low water period was a period of occasional low water and the only such period for which complete records of flow for these points are available. The frequency of occasional low water is about once in five years.

	Miles below proposed dam	Drainage area sq. mi.	1914 low water—mean discharge in sec. ft.					1925 low water—mean discharge in sec. ft.			
			July	Aug.	Sept.	Aver.	%	July	Aug.	Sept.	Aver.
1. Lock No. 2	157	8,470	2,610	2,290	2,070	2,323	100	2,096	1,353	1,230	1,360
2. Radford	7	2,720	1,650	1,480	1,330	1,[illegible]	84				
3. Inflow between Radford and proposed dam		320	287	318	207	271	12				
4. Site of proposed dam	0	2,400	1,363	1,162	1,128	1,216	52				
5. Lock #2 minus discharge at site of proposed dam (1–4)			1,247	1,128	947	1,107	48				
6. Percentage disch. at proposed dam to disch. at Lock #2			52	51	54	52					

3220 NOTE.—No. 3 figured by multiplying the ratio of drainage areas of Copper Valley gaging station on Little River to total difference in drainage area between Radford and the site of proposed dam by the discharge at Copper Valley. Thus, $\left(\frac{320}{195}\right)\times 175$ sec. ft. = 287 sec. ft., or the mean discharge for July, 1914.

The proposed reservoir with a dam 115 feet high is 4,000 acres in area and will doubtless store more than 100,000 acre feet of water. In a period of occasional low water such as that of 1914 the full flow of the river for 40 days will be required to fill the reservoir for the first time. Such a condition would seriously interefere with navigation.

The proposed installation is 80,000 horse power. Full operation at 85% efficiency and a head of 100 feet requires a discharge of 8300 second feet. The Federal Power Commission uses 70% efficiency in figuring the power capacity of a project, while the actual efficiency obtained is much greater. If the plant were operated as a daily peak load carrier in low water seasons it would release 8300 second feet for nine hours a day and nothing during the remainder of the day. A discharge of 6,000 second feet at Dam No. 5 produces one foot of depth on the crest of Dam No. 6. At this discharge it is generally necessary to lower the dam. The releasing of such a wave could cause the lowering and raising of the Kanawha River movable dams every day. This is utterly impractical.

Operation as a daily peak load carrier in a season of occasional low water such as 1914 would exhaust the 40,000 acre feet of storage in 11 days and require the full 24-hour flow for 16 days to fill again. This would seriously interefere with navigation.

The proposed dam above Radford may be operated so as to be beneficial to navigation by increasing somewhat the dry season flow by drawing upon the storage, but in the absence of authorized control the operation may be so conducted as to be a menace to navigation by causing alternate waves of excess and deficient discharge during the dry period. It is therefore concluded that the Federal Power Commission must retain jurisdiction over the proposed project in order to assure uninterrupted navigation.

U. S. Engineer Office,
Huntington, W. Va.,
October 15, 1925.

1926, July 23—Report of Hubert Deakyne, C. of E., to Merrill Executive Secretary on declaration for project No. 739.

3223

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ENGINEERS,
Washington, July, 23, 1926.

Address Reply to Chief of Engineers, U. S. Army, Washington, D. C.

Refer to File No. 7495 (New River Developt. Co.) 25.

The EXECUTIVE SECRETARY,
Federal Power Commission, Washington, D. C.

DEAR SIR: 1. Reference is made to your letter dated April 7, 1926, and the accompanying data with respect to the Pit and Sacramento Rivers in California and the application of these data to the variation of flow in the New River.

2. After having made a careful study of the data submitted I am of the opinion that due to the peculiar conditions existing in the Pit River as shown by the fact that there is practically no decrease in the height of the wave between its source at Pit #3 and Ydalpom, a distance of about 40 miles, the data do not give a true picture of how a wave travels down a river. Further, due to the totally different character of the two rivers, considerable doubt is felt as to the possibility of computing wave attenuation in the New River from data obtained in the Pit and Sacramento Rivers even if sufficient data on the latter streams were available. In my judgment the only correct procedure will be to study the action of the waves produced by the intermittent operation of the present plant at Ivanhoe on the New River. Such a study has been started and will be continued until a satisfactory answer is obtained.

3. The previous report of this office dated December 29, 1925, on the effect of the proposed project would have on the navigation in the Kanawha River was based on records of stream flow from 1909 to 1916 inclusive. These records showed that during the period in question the drainage area below the proposed plant would provide sufficient water to meet the needs of navigation in the Kanawha River. The summer of 1925 was exceptionally dry and considerable difficulty was experienced in maintaining navigation in the Kanawha River. It appears, therefore, that at long intervals there may be seasons in which the stream flow is smaller than that covered by the years 1909–1916 and during which the run off from the area below Radford might be inadequate for navigational purposes.

4. I, therefore, report that there is reason to believe that in the future exceptionally dry seasons may occasionally occur dur-

ing which the proposed project near Radford, if unregulated, might adversely affect the navigable capacity of the Kanawha River.

Very respectfully,

HERBERT DEAKYNE,
Brig. Gen., C. of E.,
Acting Chief of Engineers.

3224 *Government exhibit No. 97*

1925, Dec. 29—Report of General Taylor, C. of E. to Executive Secretary on declaration for project No. 739.

3225

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ENGINEERS,
Washington, December 29, 1925.

Refer to File No. 7495. (New River Developt. Co.) 18.

The EXECUTIVE SECRETARY,
Federal Power Commission, Washington, D. C.

DEAR SIR: 1. Under date of October 28, 1925, you transmitted to this office a memorandum from the New River Development Company by their attorneys, Messrs. Curtis, Mallet-Prevost, Colt & Mosle, in which request is made that the Chief of Engineers reconsider his report of August 20, 1925, to the Federal Power Commission on the Declaration of Intention of the New River Development Company.

2. In that report the Chief of Engineers stated that "while the navigable capacity of the stream is limited this office must report that no sufficient reason is seen why the Federal Power Commission should not exercise jurisdiction over the proposed project."

3. The declarant now requests reconsideration of those portions of this report relating to:

A. The navigability of New River.

B. The effect of the proposed project upon the navigable capacity of the Kanawha River.

A careful study has been made of all the data presented by the declarant and a further study has been made of all available data and records bearing on the questions at issue which are available in this office, or which could be obtained from other government bureaus. The following report is the result of the additional studies which have been made and the additional information which has been obtained since the date of my previous report:

A. As to the navigability of New River.

What constitutes a navigable water of the United States within the meaning of the commerce clause of the Constitu-
3226 tion and the acts of Congress based thereon, including the Federal Power Act, has been defined in numerous decisions of the Supreme Court and from these decisions the following rule is deduced:

A stream is navigable in law when it is navigable in fact, and it is navigable in fact when, in its natural or improved condition, it affords a channel for useful commerce of a substantial and permanent character, conducted in the customary modes of trade and travel on water. A theoretical or potential navigability, or one that is temporary, precarious and unprofitable, is not sufficient, but to be navigable in fact a watercourse must have practical usefulness to the public as a highway for transportation. A stream navigable in fact, as thus defined, is a navigable water of the United States when it forms by itself, or by uniting with other waters, a continuous highway over which commerce may be conducted between the States.

Having this rule in mind, I am of the opinion that the data and information disclosed in the Department's records and reports do not support the conclusion that New River affords a channel for useful commerce or that it is navigable in fact. That section of the river between its mouth and the town of Hinton, having a fall of about 735 feet in a distance of less than 60 miles, may be dismissed from discussion. This Department has reported that the whole section is unfavorable for navigation and that it could not be connected with navigation in the Kanawha by the expenditure of any reasonable amount.

Surveys have been made in accordance with the direction of Congress of the stretch of river extending from Hinton, W. Va., at the mouth of Greenbrier River, upstream to the mouth of Wilson Creek in Virginia, a distance of about 190 miles. The lower 24 miles only of this stretch is in West Virginia, the remainder being in the State of Virginia and embracing practically all of the stream in that State. Survey of 128 miles, from Greenbrier River to the "Lead Mines," was made in 1872, and of the 62 miles from "Lead Mines" to Wilson Creek, in 1878, the results being printed in the annual reports of the Chief of Engineers,
3227 for 1873, pages 842 et seq., and 1879, pages 538 et seq. These surveys are very detailed, covering the river mile by mile throughout the 190-mile stretch, and the reports thereon afford the only reliable information on record of original conditions. From the survey report of 1872 on the 128-mile section below "Lead Mines," the following is quoted:

"The river in its present condition presents the usual features of mountain streams, reaches of comparatively still and deep water separated by rapids and shoals. In the upper portion for 85 or 40 miles the pools are generally very short, whole miles being composed of ledges of slate or limestone, 200 or 300 feet apart, with small pools between. In the lower portion, though the rapids are more concentrated, yet even then the pools will hardly average more than one mile in length. The total fall from Lead Mines to Greenbrier is 531 feet, or about 4¼ feet per mile."

The survey report of 1879, on the 62-mile section above Lead Mines, contains the following:

"As is usual with mountain streams, this river presents pools of comparatively deep and still water, separated by rapids, shoals and falls. The water flows in the pools at about the rate of 1 mile per hour; over the rapids at the rate of 3 miles per hour, and over the falls at about the rate of 5 miles per hour. The depth usually over the falls is from 9 to 12 inches; frequently however, obstructions are formed below by bowlders, which increased this depth to 2 feet. Throughout this survey the pools are very short, whole miles being composed of ledges of gray and blue granite or slate, a few hundred feet apart, with very short pools between. Only five pools of a mile in length in this portion of the river. The total fall in the river from the mouth of Wilson to the Lead Mines is 507 feet, or about 8½ per mile."

The detailed, mile by mile, data given in the reports fully
justify these concrete statements, and it seems unquestion-
3228 able that the river was not navigable in fact in its original
natural condition.

It is my opinion that these natural conditions were not changed by subsequent improvements, to the extent of making the river a highway for commerce.

It appears from the annual reports of the Chief of Engineers that the work of improvement accomplished up to the time it was finally discontinued is as follows:

1. From Hinton Landing to Wiley's Falls, a distance of 26 miles, a channel 50 feet wide and 2 feet deep was obtained, practically all of which is in West Virginia, less than 2 miles extending into Virginia. The fall in this distance is 104 feet. From Wiley's Shoals to New River Bridge, a distance of about 60 miles, a succession of falls, shoals and rapids, no improvement work was undertaken.

2. Above New River Bridge and between that point and the Lead Mines, 29½ miles of channel was deepened to 2 feet, 12 miles of which was widened to 30 feet, 2½ miles to 20 feet, and 15 miles to 10 feet. On account of the existence of Fosters Falls, the fall being 18 feet in less than half a mile, improvement work was carried no farther on this stretch.

3. Above Lead Mines, on a reach of 62 miles, about 5 miles of channel was improved to a depth of 2 feet and width of 20 feet.

Of the 190 miles of river embraced in the adopted projects, work was carried on only on about 60 miles, and this 60 miles was divided into 3 widely separated stretches with long unnavigable reaches between them. Work was limited to the most easily improved places and effort made to so ameliorate conditions as to permit local navigation. The results were not satisfactory or important and Congress discontinued appropriations after 1886, less than one-third of the funds required for any effective improvement having been provided. In 1899, the Chief of Engineers dropped the work from his annual report, and in the river and harbor act of 1902, Congress repealed all previous 3229 provisions of law providing for the prosecution of work on the river and directed the return to the Treasury of the unexpended balance of funds pertaining thereto. The river was not thereafter considered an authorized project for improvement.

It is evident that the work executed by the Government during the years 1877–1882, did not materially change the natural nonnavigable conditions of the river. The improvement effected was at most slight and fragmentary, and the small channels worked over are reported to have deteriorated due to the natural action of ice and the current. Continuous navigation on the river has never been possible, and whatever commerce has existed has been altogether local apparently confined to the 25-mile section in West Virginia ending at Hinton.

The District and Division Engineers have reported that there is no commerce and that the river is not now navigable in fact, but they assume that it is legally navigable for the reason that money has been expended on it for channel improvement by authority of Congress. It is well settled by judicial decisions that acts of Congress appropriating money for the improvement of a stream are not to be construed as declarations express or implied that the stream is actually navigable. Congress may authorize the improvement of a nonnavigable stream with a view to creating navigability, yet unless the improvement is accomplished the natural state of the stream is not changed. Whether or not it is navigable is still a question of fact unaffected by the consideration that money has been appropriated and expended in an effort to improve it.

I, therefore, conclude that New River is not at the present time a navigable water of the United States within the meaning of the Constitution and laws of Congress including section 3 of the Federal Power Act.

B. As to the effect of the proposed project upon the navigable capacity of the Kanawha River.

The site of the proposed dam is 155 miles above the head of navigation on the Kanawha River. The New River between this site and the Kanawha River is a series of pools of compara-
3230 tively still and deep water separated by rapids and shoals.
There is no known method of computing with any degree of accuracy the effect of fluctuations in flow at the dam on the stage of the river at various distances below the dam. The pools would act as a series of storage reservoirs, the effect of which would be to equalize the flow. I am of the opinion that any periodic fluctuations in flow due to normal operation of the project works would be so attenuated by the time they had reached the Kanawha 155 miles distant as to preclude the probability of any adverse effect upon navigation on that river.

It may be assumed as a possibility that the plant might be closed down completely for an indefinite period of time during a dry season and at a time when the storage above the dam had been drawn down. In the event of such a combination of circumstances all water from the drainage area above the dam would be shut off until the reservoir filled or until operations were resumed.

The drainage area above Dam No. 2, the upper dam in the Kanawha River, is 8,470 square miles. The drainage area above the site of the proposed dam is 2,396 square miles. The drainage area between the proposed dam and Dam No. 2 is therefore 6,074 square miles. Records of the measured flow for the years 1909–1916 are available for streams which drain a total of 3,714 square miles of this intermediate area. From these records the total flow of the drainage area below the proposed dam has been computed for each month of the years for which records are available. It is found from these computations that the run-off from this drainage area below the proposed dam is sufficient to supply the necessary water for navigation on the Kanawha River under the existing project.

Therefore, so far as can be predicted from available data and records it would not be possible to operate the proposed project so as to adversely affect navigation on the Kanawha River under the existing project.

I, therefore, report that in my opinion New River in its present condition is not a navigable stream and that navigation on 3231 the Kanawha River will not be adversely affected by the proposed power development.

Very respectfully,

H. TAYLOR,
Major General, Chief of Engineers.

3232 *Government exhibit No. 98*

1927, Apr. 12—Report of General Deakyne, C. of E.; 1926 Dec. 22—Report of Major Trippe, Dist. Eng.; 1927, Jan. 13—1st. Endorsement Col. Kutz, Division Engr. In dealing with application for license for project #739.

3233 WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ENGINEERS,
Washington, April 12, 1927

Address Reply to Chief of Enginners, U. S. Army, Washington, D. C.

Refer to File No. 7495 (Appalachian Elec. Pow. Co.)-3.

The EXECUTIVE SECRETARY,
Federal Power Commission, Washington, D. C.

DEAR SIR: 1. The letter of the Acting Chief Engineer in the absence of the Executive Secretary, dated September 9, 1926, referred to this office for investigation and report the application of the Appalachian Electric Power Company, (Proj. #739, Va.) for a license for a power development on the New River near Radford, Va.

2. The investigation has been made by the District Engineer at Huntington, W. Va., and his report dated December 22, 1926, is herewith.

3. The New River is formed by the junction of the north and south Forks near the town of Weaversford in Ashe Co., N. C. It flows first generally northeasterly to near Radford, Va., then makes about a 90 degree turn and flows generally northwesterly to just above Kanawha Falls where it joins the Gauley River forming the Kanawha River. The Kanawha River has been improved for slack water navigation by the Federal Government from its mouth to 7 miles below Kanawha Falls, a distance of about 89 miles. The navigation improvements on the New River have been covered in the various reports from this office on the declaration of intention of the New River Development Company.

4. The applicant proposes to build one dam about 6 miles above Radford, Va., and 155 miles above the head of navigation in the Kanawha River. The dam will create a navigable pool about 19

miles long extending from the dam up to about 2 miles above Clarks Ferry.

5. The principal data regarding the project are as follow:

Location, Near Radford, Va.

Project Area	acres	5,800
Height of dam	feet	110
Draw down	feet	10
Useful storage	acre feet	40,000
Open river flow:		
Minimum	second feet	560
Average	second feet	3,770
Maximum	second feet	138,000
Regulated flow—90% of time	second feet	1,200
Average static head	feet	106
Power capacity	horsepower	10,176
Probable installed capacity	horsepower	80,000

3233–A 6. For the effect of the project on the navigable portion of the Kanawha River see the report from this office, on the declaration of intention of the New River Development Company, 7495 (New River Development Co.)—25, dated July 23, 1926.

7. A public hearing was held at Radford, Va., on October 28, 1926, at which demands were made that the flow of the river be regulated in the interest of navigation and power production as follows:

The Great Kanawha River Improvement Association—to protect navigation in the Kanawha River.

The Virginia Railway Co.—to provide condensing water for the steam plant at the Narrows.

The Electro Metallurgical Co.—to provide ample water for the hydro-electric plant at Kanawha Falls.

The Public Service Commission of West Virginia, in the interests of navigation and power in general.

It is believed that the conditions recommended to be inserted in the license, if issued, will protect all the above protestants and furnish sufficient water to provide for the requirements of navigation in the Kanawha River and for power production on the lower reaches of the New River.

8. The design of the dam has been checked and has been found to be satisfactory so far as the requirements of navigation are concerned. Attention is called to the recommendations of the District Engineer (Par. 18) that the intake of one of the penstocks be lowered so that advantage may be taken of the storage below the proposed 10-foot draw down during periods of low flow. It is believed this point should be given further study.

9. The applicant and subsidiary companies at present operate thirteen plants with an installed capacity of about 298,000 K. W. and an extensive transmission system. The present project will

be operated as a peak load plant and no trouble should be found in utilizing the additional power under these conditions.

3234 10. The applicant is controlled by the American Gas and Electric Company which is believed to possess ample funds to finance the present project.

11. It is recommended that the licensee be required to begin construction within one year and to complete the construction of the project within 4 years from the date of the license.

12. I concur in the recommendation of the District Engineer that a license be granted the applicant provided it is subject to the following conditions, articles 3, 4, 5, 7, 8, 9, 10, 11, 12, 15, 16, 19, 22, 23, 24, 25, 26, 27, 28, 29, 30 of license No. 432 and to the following condition:

The licensee shall at all times discharge a minimum of 8,050 acre-feet per week over or through the dam. Whenever the flow at Lock No. 2, Kanawha River, falls below 1,400 second feet the licensee, when so directed by the Secretary of War, shall discharge in each 24 hours the minimum flow of the river during that period up to a discharge of 1,150 acre-feet. The above discharge shall at all times be regulated by such rules and regulations as the Secretary of War may prescribe to prevent interference with navigation on the Kanawha River.

Herbert Deakyne,
Brigadier General,
Acting Chief of Engineers.

12 inclos., viz:
- Sub. 1—Application.
- Serial 10—Report.
- Subs. 1 & 2 of Ser. 10—Notice of public hearing.
- Sub. 3 of Ser. 10—Public hearing.
- Subs. 4 to 9 of Serial 10—Correspondence.
- Sub. 10 of Ser. 10—Statement by applicant.

Subject: Report on Application for License for Proposed Power Development in the New River in Pulaski County, Virginia, by the Appalachian Electric Power Co., Project No. 739, Virginia

To: The Chief of Engineers, U. S. Army, Washington, D. C. (Through the Division Engineer, Central Division, Cincinnati, Ohio).

1. Complying with the request of the Federal Power Commission dated September 9, 1926, there is submitted herewith a report

on the application for license filed by the Appalachian Electr
Power Co. of Richmond, Virginia, for a power development in t
New River in Pulaski County, Virginia (Federal Power Proje
No. 739 Virginia).

RESUMÉ

Project Number: 739 Virginia.

Applicant: Appalachian Electric Power Co. of Virginia.

Stream: New River, tributary to Kanawha River.

Project Works: Dam: Concrete 110 feet high across New Rive
Reservoir: 19 miles long with surface of approximately 4000 acr
Conduits: 4 steel penstocks imbedded in dam. Powerhouse: Bri
and steel containing 4, 15,000 k. w. alternating current generato
Transmission lines: Power to be generated at 13,200 volts, 60 cycl
and conducted into transmission system 500 feet outside of th
project.

Project area: 5,800 acres.

Public lands: None involved.

Storage capacity: 40,000 acre-feet with a 10-foot drawdown.

Stream flow: Minimum 560 second-feet. Average 3,770 secon
feet. Maximum 138,000 second-feet. Regulated minimum 9
second-feet.

Average static head: 106 feet.

3236 Power capacity: 10,176 h. p.

Proposed Installed Capacity: 60,000 k. w. or 80,000 h.

Modification recommended: None.

Special condition: Licensee shall: Furnish detail plans; mai
tain stream gaging station; clear reservoir; pass continuously th
minimum natural flow; be governed by rules of the Secretary
War and the Federal Power Commission.

Important recommendations: License be granted.

2. Watershed

The sources of New River lie in the Appalachian Mountai
among the high ridges that form the divide between the Peed
and Santee Rivers, which drain eastward into the Atlantic Ocea
and the streams which drain westward through the Tennesse
Ohio and Mississippi Rivers into the Gulf of Mexico. It may b
said that the river rises in the central part of Watauga County, i
the extreme northwest corner of North Carolina, at an elevatio
of about 3700 feet. Thence it flows northeasterly into Virginia t
a point a short distance below Radford where it makes almost
90-degree turn and flows northwesterly through a gap in the All
gheny Mountains into West Virginia. It joins the Gauley Rive
a short distance above Kanawha Falls, forming the Kanawh

River. The Kanawha in turn flows northwesterly into the Ohio River at Point Pleasant, West Virginia.

The complete system of the New-Kanawha is 429 miles long and drains 800 square miles in North Carolina, 3,000 square miles in Virginia and 8,400 square miles in West Virginia.

The New River flows down a steep gradient from its source to the vicinity of Ivanhoe, Va. (mile 147 from source). From Ivanhoe to a point about 10 miles below Hinton, W. Va. (point at mile 280), the gradient is flatter. Through this reach the river bed is a series of pools connected by short rapids.

At a point about 10 miles below Hinton the river enters a gorge, the channel being narrow and the gradient steep for about 50 miles. The river abruptly leaves the gorge and merges with the Gauley River to form the Kanawha River a short distance above Kanawha Falls (mile 334). The falls here are about 27 feet high. From Kanawha Falls the gradient averages about 3 feet per mile for 7 miles and then is very flat to the mouth.

The Kanawha is improved for slack water navigation from a point 7 miles below Kanawha Falls to its mouth at Point Pleasant, a distance of 89 miles. This improvement is maintained by two fixed dams (furthest upstream) and eight movable dams. The valley of the Kanawha abounds in a vast amount of natural wealth and the river affords a valuable transportation outlet for these resources.

3237 The elevation of New River at the proposed development is 1,725 feet. The watershed above this point is largely timbered, the river flowing through sparsely-settled, rugged mountain country. Being in the Appalachian region the basin is subject to storms from the Atlantic Ocean as well as from the Gulf of Mexico. Owing to this the valley is not immune to high water or floods in any month of the year.

The following table gives distances, elevations, and slopes for several points along the New-Kanawha River.

	Elevation	Distance	Fall between points	Distance between points	Average fall per mile
	Feet	*Miles*	*Feet*	*Miles*	*Feet*
Sources	3,700	0			
Junction of North and South Forks	2,500	86	1,200	86	14.0
Oldtown, Va	2,220	126	280	40	7.0
Radford, Va	1,720	192	500	66	7.6
Va.-W. Va. State Line	1,490	245	280	53	4.3
Hinton, W. Va	1,365	270	125	25	5.0
Kanawha Falls Head	650	334	715	64	11.2
Kanawha Falls Foot	623	334		0	
Head of Navigation	595	340	28	6	4.7
Mouth	510	429	85	89	1.0

Geology

The great topographic feature of the region is a peneplain of Tertiary age which stands at 2,000 to 2,100 feet elevation. After the upraise the New River and its immediate tributaries cut down some 300 feet through the peneplain. Where the formation was hard the gorge is 500 to 1,000 feet wide. In softer formation the gorge is rounded to a valley several thousand feet wide.

Structurally the region is characterized by folds and thrust faults. In the mountain section, where stiff sandstones are present, the structures are on a large scale. Structures are generally easily determinable since easily recognizable formations are also present. In the limestone valley structures are less easily recognizable. Here structural units vary from hundreds of miles down to miles or even rods, and satisfactory determination of the true relations of the various units is not a simple matter. The forces which produced these structures acted at various times, some of which were separated from others by long erosion periods which cut many thousands of feet into these strata. While it is known that certain movements took place at certain times with reference to other movements the sequence of events is not known in detail and even the periods of geologic time in which these took place are not certainly known.

The dominant structure of the region is a broad thrust fault. This great thrust took place late in a series of thrusts. The greater part of the folding and faulting of the region had taken place before this thrusting occurred. The underlaying material contains folds and faults which are certainly older than the thrust fault.

Some of the folds and faults of the overthrust, and probably
3238 most of them, antedate the overthrust but their date is not
so easily established. It seems quite certain that there was
some folding after the overthrust.

The rocks of the region are well consolidated sediments. The Sandstones are all well cemented but only occasionally quartzitic. The shales are platy but never slates. The dolomites and limestones are generally compact to finely crystalline. There, acutely folded, the dolomite is sometimes much recrystallized. Where mild shattering has taken place there is recementation with the vein material either calcite or dolomite, or there may have been two periods of vein formation with one set of veins, usually the older, of dolomite and another set of calcite.

3. References

The following public documents and reports contain information concerning the water resources of the New River:

Survey from the mouth of the Greenbrier River to Kanawha Falls in the Kanawha River, made in 1819 by Moore and Briggs under the auspices of the Board of Public Works of the State of Virginia. (Erroneously mentioned in previous reports as between Sinking Creek and Greenbrier River.) The survey was made with the view of connecting the waters of the James and Kanawha Rivers by a canal.

"Examination and Survey of New River from the mouth of Greenbrier, West Virginia, to the lead mines in Wythe County, Virginia." (Senate Ex. Doc. No. 25, 2d Congress, 3d Session, Annual Report, Chief of Engineers, 1873, pages 78 and 842.) This report treats of navigation features only.

Va., to the Chief of Engineers. (E. D. 7495, New Riv. Dev. Co.) This project is the subject of this report on application for license.

Statement of the "Effect on navigation of proposed New River Development Co. project on New River near Radford, Va.," made by the District Engineer, Huntington, W. Va., to the Chief Engineer, Federal Power Commission, Oct. 15, 1925. This project is the subject of this report on application for license.

"Report on the waves caused in the New River by the intermittent operation of the Appalachian Electric Power Co.'s hydropower plant near Ivanhoe, Va.," by the District Engineer, Huntington, W. Va., to the Chief of Engineers under 1st indorsement, June 9, 1926. (E. D. 7495, New Riv. Dev. Co. 33.)

3240 U. S. Geological Survey Water Supply Papers as follows:

No. 536, contains summary with all discharge records in the New-Kanawha drainage basin, 1898 to 1918.

No. 503, Part III, contains discharge data on New River for 1919 and 1920.

No. 523, Part III, contains discharge data on New River for 1921.

No. 543, Part III, contains discharge data on New River for 1922.

4. Development in New River

The Federal Government has done work in New River for the improvement of navigation. This consisted of building channel chutes or sluiceways across the bars. These chutes were about 50 feet wide and 2 feet deep at extreme low water and were improved by cutting out rock, where necessary, and piling up stones along the sides of the chutes in order to direct the water through them. This work extended from Hinton upstream a distance of about 25 miles. About $100,000 was expended on the work previous to 1883, and $10,000 since that time. These chutes have deteriorated from the natural action of the current and ice.

Work done by private parties in the development of the watershed has been the construction of the following water-power plants:

Location	Owner	Date operation commenced	Head (feet)	Type of dam	Horsepower	
					Max.	Aver.
Fries, Va	Washington Mills	1901	40	Fixed	2,800	1,300
Byllesby, Va	Appalachian Power Co. No. 2 Dev.	1912	52	Fixed with movable crest.	24,000	[1] 4,840
Buck, Va	Do. No. 4 Dev	1912	41	Do	12,000	[1] 3,380
Kanawha Falls, W. Va.	Electro Metallurgical Co.	1899	28	Fixed	6,000	5,090

[1] For years 1922 to 1924.

At Fries, Va., the operation of the plant is on a ten-hour basis, but by means of hourly storage the entire low-water discharge is used.

The plants of the Appalachian Power Co. are installed for a capacity of 4,800 second-feet, which is maintained about 5.5 percent of the time. They have hourly storage and are used as daily peak load carriers during most of the time.

The Kanawha Falls plant is used in a metallurgical process which requires a continuous 24-hour load. A permit was issued February 27, 1899, by the Secretary of War for the dam on the crest of the falls.

3241 The plant at Fries was authorized by Act of Congress approved June 4, 1900 (34 Stats., L, 264). However, the dam is probably an illegal structure since the plans were not presented to or approved by the War Department in accordance with Sect. 8 of the Act of March 3, 1899. (See par. 3, page 30, Sen. Doc. No. 15, 63d Congress, 1st Session.)

5. Rainfall and run-off data

The average annual precipitation in the basin above the proposed project is between 40 and 50 inches with an average run-off of 20 inches.

The U. S. Geological Survey have maintained a number of stream gaging stations in the basin of the New-Kanawha River. From the following pertinent stations the discharge and run-off have been computed for the proposed project:

Station	Drainage, area (sq. mi.)	Maintained
Copper Valley on Little River, 13 miles above mouth.	195	Aug. 1908 to Sept. 1915.
Radford on New River, 6 miles below project	2720	Aug. 1898 to Jul. 1906. May 1907 to Sept. 1915.
Eggleston on New River, 30 miles below project	2920	Oct. 1914 to date.
Kanawha Falls on Kanawha River, 149 miles below project.	8300	Apr. 1877 to date.

The drainage area at the proposed dam site is 2,400 square miles. Of the 320 square miles of drainage area between the dam site and the Radford gage, 195 square miles of this are above the Copper Valley gage on Little River. On the assumption that the run-off per square mile for the whole of the 320 square mile area was the same as the run-off per square mile for the area above Copper Valley, the run-off at the dam site was computed by subtracting from the Radford run-off the inflow between the dam site and Radford. With this, and the assumption that between August 1906 and April 1907 the relation between the Radford and

Kanawha Falls run-off was the same as the average relation for the periods five years before and five years after, the run-off was computed for the water years 1899 to 1915. On the assumption that the run-off per square mile above Radford was the same as that above Eggleston and the above relation between the 3242 dam site and Radford, the run-off was computed for the water years 1916 to 1926. Thus a complete record of monthly mean flow from 1898 to 1926 was determined.

Water Supply Paper No. 536 states on page 24 that the minimum flow at Radford is probably between 500 and 700 second-feet. The flood of September 15, 1878, reached a stage of about 37.4 on the U. S. G. S. gage. The highest stage recorded was 30.2 feet on May 22, 1901, discharge roughly 138,000 second-feet.

The applicant has submitted duration curves as Exhibit I-A. These have been computed on the assumption that the flow at their dam site was 84 percent of that at Eggleston, which is regarded as sufficiently accurate for the purposes of the studies. The average value used in the estimate of the monthly mean flow was 82.22 percent.

Using the duration curve the discharge available 90 percent of the time is 1,200 second-feet which is regarded as the available water supply.

6. Storage reservoirs

Several storage reservoir sites are available in the New River (a) to (i) of table in Section 7. The seven sites of the Central Power Co. were proposed in connection with their application for preliminary permit to divert water from the New River through the Appalachian divide into the Yadkin River drainage on the Atlantic slope. The Oldtown reservoir site was proposed by the Eastern States Development Co. in application for preliminary permit for a similar diversion project. The Federal Power Commission has refused these permits and it is not known if they intend to use them for regulation of flow in New River or that such is feasible.

It is not known whether the Appalachian Electric Power Co. intends to develop their proposed site or not.

The climatic conditions in the headwaters of New River are such that it is very difficult, if not impossible, to predict flow conditions with any reliable degree of accuracy. The following table and Exhibit A show this very forcefully. This table and diagram were made from the computed 28-year record of monthly mean flow mentioned in Section 5, page 9.

TABLE SHOWING IRREGULAR OCCURRENCE OF LOW AND HIGH WATER FLOW IN NEW RIVER

Each month was among the three lowest, two lowest, or was the lowest month during the year the number of times shown; likewise the highest the number of times shown.

	Among 3 lowest months	Among 2 lowest months	Lowest month	Among 3 highest months	Among 2 highest months	Highest month
	Times	*Times*	*Times*	*Times*	*Times*	*Times*
Jan	2	1	1	11	11	6
Feb				14	10	6
Mar				18	13	8
Apr				13	7	2
3243 May	3	2		9	6	1
June	[illegible]			6	2	1
July	6	4	2	3	2	2
Aug	15	11	5	3	1	1
Sept	15	11	5			
Oct	14	9	8	2	1	0
Nov	19	14	5			
Dec	5	4	2	5	3	1

The above table shows that the prediction of low or high water is never greater than 68 percent and that in occasional years high water will come when low water is generally expected. Likewise, low water will come when high water is generally expected. The fact that the chances are about the same that December may be a low or high water month shows that the low water season may be of long duration. The duration curves of monthly flow (Exhibit A) show that the prediction of the amount of flow is also uncertain. While the curves for August, September, October, and November are fairly close together and regular the curves for the other months, and particularly the months that would be used for filling a reservoir, are very irregular and cover a wide range in flow for a good percentage of time.

The reservoir sites in the upper part of the river are in reaches where steep gradients control. From this and the above facts it might be found that unreasonably large and expensive reservoirs might be necessary for a small or even fair amount of regulation.

The proposed reservoir of the project applied for has heretofore been regarded as a storage possibility. The applicant proposes using only 40,000 acre-feet of the total reservoir contents as storage water. This is a small amount and is likely to be most used in leveling or increasing the hourly and daily fluctuations during any month. Its principal use will probably be in increasing the monthly and seasonal flow in extremely low water periods. The use of storage from this site decreases the head very fast and consequently the amount of power from a given amount of flow decreases as the demand for power increases.

The Oldtown reservoir site of the Eastern States Development Co. will develop 329,900 acre-feet of storage and a uniform draft of 1775 second-feet.

No topographical surveys have been made of the other sites and definite quantities cannot be given.

7. Power sites

New River with its high run-off and steep gradient possesses a great wealth of water power. The development of this power is retarded on account of the proximity to the Appalachian coal fields and almost prohibited in some reaches because of railroads on the river bank. Due to these it is only under the most favorable conditions that a waterpower development is feasible.

3244 No complete survey has been made to determine all the favorable locations of power sites. Those sites known from available data are as follows:

Table of Dam Sites on New River

Site	Distance from sources	Approx. head	Drainage area	Remarks

The Central Power Co., Project No. 542 N. C., applied for preliminary permit to construct power and diversion dams, diverting the water through the divide into the Reddies River on the Atlantic slope. The permit was refused by the Federal Power Commission September 15, 1926.

3245 The Eastern States Development Co., Project No. 575, Va., N. C., applied for preliminary permit to construct a dam at the Oldtown site and divert water through the divide into the Fisher River on the Atlantic slope. The permit was refused by the Federal Power Commission September 15, 1926.

The Virginian Power Co. originally made preliminary locations of seven proposed developments (u to z). These sites were located after a general reconnaissance of the river but the surveys were not carried to the point of determining the most feasible locations. This company has now been absorbed by the Appalachian Electric Power Co.

8. Power capacity

From the duration curve submitted by the applicant, a discharge of 1,200 second-feet is available 90 percent of the time. With this and an average static head of 106 feet the power capacity of the project equals $0.08 \times 106. \times 1200. = 10{,}176$ h. p.

The development will probably be operated as a peak-load carrier in order to operate steam plants at a higher load factor. Under this condition the annual load factor of this plant may be as low as 35 or 40 percent while the annual load factor of the connected system is about 50 percent.

It is estimated that an average of 94.4 percent of the head available at full plant capacity will be utilized per annum. With this head the full plant capacity of 60,000 k. w. will require a discharge of

$$Q = \frac{60{,}000}{.678 \times 100} = 8{,}850 \text{ second-feet at } 80\% \text{ efficiency.}$$

The duration curve shows that this discharge is available 3.8 percent of the time. Thus 96.2 percent of the total flow can be used. The utilization factor is then equal to the product of head and flow used.

$$0.944 \times 0.962 = 0.908 \text{ or } 90.8\% = \text{utilization factor.}$$

9. Power market

The Appalachian Power Co., the basic company from which the Appalachian Electric Power Co. was formed on March 4, 1926, has supplied southwestern Virginia and southern West Virginia with power since 1912. With a total output of 40 million kilowatt-hours in 1913, the company has had a growth averaging 20 million kilowatt-hours a year to 1925 and 27 million kilowatt-hours since 1920. The interconnected system of the Appalachian Electric Power Co. serves 266 communities with electric light and power in rapidly-growing and prosperous industrial, agricultural and coal-mining regions of Virginia, West Virginia and eastern Kentucky. The total population served is estimated to exceed 658,000.

It is believed that the territory served by the applicant through its interconnected system offers a good market for the power which will be developed at the proposed site.

The low production cost in this region of power from steam-electric plants prohibits the development of hydroelectric power at
anything except plants whose economic feasibility cannot be
3246 questioned. It is probable that a company with such a
large percentage of its capacity installed in steam generation would find it feasible to install hydroelectric capacity at a higher unit cost per kilowatt in order to operate its steam stations at a higher load factor, the hydroelectric plant being used as a peak-load carrier.

The applicant's financial ability is believed sufficiently strong to carry out the proposed development. A financial statement is given on page 16 of the application. The Appalachian Electric Power Co. is controlled by the American Gas and Electric Co. which is regarded as a sound corporation.

10. Accuracy of data

The data submitted with the application agrees with the facts found in the locality.

11. Additional data

The data submitted are sufficient for the consideration of the application. It is believed that the applicant should be required to furnish detail plans when they are completed

12. Time for completing project

The applicant has asked for one year from date of license to begin construction and four years from date of license to complete construction of the project works. This is believed to be a reasonable time and is recommended to be in the terms of a license.

13. Navigable stream

This office in its report on declaration of intention, July 23, 1925, for this project, stated in par. 6:

"It is the opinion of this office that the New River is a navigable stream as defined by the Federal Power Act and that the proposed water-power project of the New River Development Company should be considered as coming under the jurisdiction of the Federal Power Commission."

The Division Engineer under 1st indorsement, July 25, 1925, stated,

"The Division Engineer concurs in the opinion of the District Engineer that the reach of New River under consideration comes under the jurisdiction of the Federal Waterpower Commission. This opinion is based primarily upon the fact that this reach of river was recommended to Congress for improvement after investigation under its authority, though not actually improved."

The Chief of Engineers subsequently in letter to the Executive Secretary, Federal Power Commission, August 20, 1925, stated,

"The fact that navigation does not exist at present is not understood to change the legal status of the stream. Congress has in the past signified its intention to assert jurisdiction of the New River by appropriating money for its improvement with a view to making the stream navigable, and it is not seen that the fact that the reversion to the Treasury of unexpended funds was later ordered alters its status."

3247 The Chief of Engineers later in letter to the Executive Secretary December 29, 1925, stated,

"I, therefore, conclude that New River is not at the present time a navigable water of the United States within the meaning of the Constitution and laws of Congress including Section 3 of the Federal Power Act."

Effect of navigation

The proposed project might effect the navigable capacity of the Kanawha River in the following cases:

"The flow through the applicant's dam may be stopped or reduced while allowing the reservoir to fill at a time that the inflow from the basin below the dam was insufficient to maintain the pools at the various navigation dams.

"If the waves caused from the intermittent operation of the power plant continue downstream in large-enough size and duration they might cause,

'the raising and lowering of the Kanawha movable dams with each wave,

'extremely hazardous navigation through the chutes of the Kanawha due to the unnatural change in the river stage.'"

An incomplete study of the persistence of waves caused by the operation of the power plant at Ivanhoe, Va. (40 miles above the proposed site) indicates that these waves persist for long distances downstream. It is probable that the larger waves from the proposed plant will have an adverse effect on navigation in the Kanawha River unless regulated at critical times.

14. Protection of navigation

The following requirements are regarded as necessary for the protection of navigation and it is recommended that they become a part of the license:

That the licensee shall pass continuously through its dam during and after construction a flow not less than the minimum natural flow as determined from a gaging station to be established by them in New River above and sufficiently close to the reservoir created by the project works.

That the operations of the licensee, so far as they effect the use, storage and discharge from storage of the waters of New River, shall at all times be controlled by such reasonable rules and regulations as the Secretary of War may prescribe in the interests of navigation and as the Federal Power Commission may prescribe in the interests of flood control, damage to other interests and for the fullest practicable utilization of the waters of the said river for power purposes.

15. Public lands

The project does not contemplate the use of public lands or other Government property.

3248

16. Government reservation

The project is not on a Government reservation.

17. Government dam

The project does not contemplate the use of a Government dam.

18. Utilization of resources

The plan submitted is believed to be the best adapted to develop, conserve, and utilize in the public interest the navigation and water resources of the region.

A dam site exists at Ingles Falls 2½ miles below the proposed location. The use of this site would give the advantage of more head and an increase in discharge due to the addition of 285 square miles of drainage area from the Little River. This is manifestly infeasible since the pool created would submerge the towns of

Graysonton and Snowville and the Radford municipal power plant on Little River and destroy a valuable limestone quarry and crusher plant on New River immediately above the mouth of Little River. A value of $700,000 has been placed on this property.

The Appalachian Electric Power Co. has several power sites along New River and since they have acquired the properties of the Virginian Power Co., permittees for Project No. 379, Va., W. Va., (v) in Section 7 of this report, they will in all probability be the most extensive developers of the power resources of New River. In view of these facts the company is more interested in the best plan of development of the power resources of New River than would otherwise seem.

The applicant proposes a drawdown in their reservoir of 10 feet. This provides a storage of 40,000 acre-feet which is a small part of the contents of the reservoir. The maintenance of a head as high as possible is necessary for a high utilization of the resources. However, the wisdom in placing the intake of the lowest power penstock 10 feet below the normal pool surface is doubtful. It is therefore recommended that the applicant be required to place at least one of the power penstock intakes sufficiently low so that the reservoir may be drawn down considerably more in the event of a very long and extended drought, when it would be desirable to use more than the water stored in the top 10 feet of the pool.

19. Safety of structures

Analysis of the designs submitted as Exhibit "L" in the application shows adequate provision for safety in design for the dam and spillway. With the flashboards removed the spillway and flood gate section will pass a flood of 62.5 second-feet per square mile of drainage area with the pool 2 feet above normal. The estimated maximum discharge for the 1916 flood was 42 second-feet per square mile and the 1,878 flood (the highest of record), 60 second-feet per square mile. It is therefore concluded that adequate spillway capacity has been provided in the designs submitted.

The applicant has made extensive exploration of the foundation at the dam site. The District Engineer in company with consulting engineers, inspected the site during these explorations. The strata show clear evidence of the cementation by the intrusion of calcite. (See Section 2.)

3249 Consideration of the geology of the region and examination of the foundation show no inherent reason that the foundation will be unsafe for a dam such as proposed.

The firm Viele, Blackwell and Buck is acting as engineer for the project, and Colonel F. W. Scheidenhelm of Mead and Scheidenhelm is being retained as consulting engineer. These firms have a national reputation and their approval of the foundation and structure is regarded as good evidence of the safety of the project works.

20. Development by the United States

The development should not be undertaken by the United States.

21. Rental of Government dam

None. See Sections 16 and 17.

22. Headwater benefits

There is at present no storage project in New River above the proposed project. The licensee may at some future date benefit from the construction of a storage reservoir. The applicant proposes to install hydraulic and electrical machinery that will enable them to utilize upwards of 96 percent of the flow of New River at their plant. In the event that such a reservoir was constructed by other parties the principal benefits to the applicant would be those of a higher utilization of the annual flow and the utilization in the low water season of a larger percentage of the annual flow than could be made without such storage. The latter benefit would be difficult of determination owing to the fact that the Appalachian Electric Power Co. have a relatively high percentage of steam capacity and would likely figure a kilowatt-hour developed from storage water during low water season of no greater value than a kilowatt-hour developed from the natural flow of the river in high-water season.

The proposed project provides a storage of 40,000 acre-feet which is the equivalent of 667 second-feet flowing for one month. The very irregular occurrence of the low-water season with its irregular amount of flow precludes any appreciable benefit from this amount of storage other than in a season of extremely low flow of considerable duration.

The plant of the Electro-Metallurgical Co. at Kanawha Falls (about 150 miles downstream), might be benefited by the release of storage from the applicant's pool. On the other hand, it might be damaged by the applicant's holding back water from the natural run of the stream. The Kanawha Falls plant is a legal structure but does not hold a Federal Power license. Under such condition it is doubtful if they could be charged for benefits received from the applicant's project. This company has protested the granting of license to the applicant unless the applicant's plant be operated so as not to damage them. It is believed that the recommended provisions of the license will minimize the possibility of such damage. In any case the Electro-Metallurgical Co. has redress in the civil courts for any damage suffered.

23. Desirability of project

The project is desirable and justifiable in the public interest for the purpose of improving the New-Kanawha River for the benefit of interstate commerce, to the extent that any increase of low-water flow will favorably affect navigation. The project is also justifiable to the extent that in creating a pool 19 miles long
3250 it renders this reach susceptible of navigation.

24. Protests

Protests to the granting of a license have been received from the following:

1. Public Service Commission of West Virginia (inclosure No. 7 with letter of transmittal).
2. Norfolk and Western Railway Co. (pages 7 to 9 in minutes of public hearing).
3. Virginian Railway Co. (pages 9 to 11 minutes of public hearing).
4. Electro-Metallurgical Co. (pages 12 to 14 in minutes of public hearing).
5. Oren F. Dodds (inclosure No. 11 with letter of transmittal).
6. Kanawha River Improvement Association (inclosure No. 12 with letter of transmittal).

All of the protestants request protection from damage by the operation of the applicant's project works. The rights of the protestants in this respect are governed and protected under State and Federal laws. It is believed that the recommended provisions of the license will minimize the possibility of damage from the operation of the project works.

The protest of the Kanawha River Improvement Association is on the grounds of protection to navigation. It is believed that the provisions that the licensee pass continuously the minimum natural flow and that the operations of the licensee shall be controlled by such reasonable rules and regulations as the Secretary of War may prescribe in the interests of navigation, protect all navigation interests.

25. Recommendation

It is recommended that the license be granted.

26. Special conditions

It is recommended that the following provisions be inserted in the license.

1. The licensee shall furnish detail plans of all structures when such plans are completed for approval by the Federal Power Commission.

2. The licensee shall establish and maintain a stream gaging station with automatic recording gage in New River above the reservoir created by the project works.

3. The licensee shall clear the reservoir area of all trees and brush between elevations 1830 and 1841 to the satisfaction of the Secretary of War and the Federal Power Commission.

3251 4. The licensee shall pass continuously through its dam during and after construction a flow not less than the minimum natural flow as determined from a gaging station to be established by them in New River above and sufficiently close to the reservoir created by project works.

5. The operations of the licensee so far as they effect the use, storage and discharge from storage of the waters of New River, shall at all times be controlled by such reasonable rules and regulations as the Secretary of War may prescribe in the interests of navigation and as the Federal Power Commission may prescribe in the interests of flood control, damage to other interests and for the fullest practicable utilization of the waters of the said river for power purposes.

LIST OF AFFIDAVITS SUBMITTED BY NEW RIVER DEVELOPMENT CO. TO FEDERAL POWER COMMISSION FOR CONSIDERATION UPON ITS DECLARATION OF INTENTION

Affiant	Status	Summary of Affidavit
K. E. Harman	President, Pulaski National Bank; Chairman, Board of Supervisors of Pulaski County.	"Port Barrel" nature of appropriations; unsuccessful attempts at navigation abandoned before construction of railroads; two-thirds of course of river consists of riffles, falls and rapids; no navigation.
E. W. Calfee	Mayor, Town of Pulaski, Va.	Uusuccessful attempts at navigation; channel made by Government now filled up, of no value to navigation.
Dr. J. W. Holmes	Farmer, Pulaski County, Va.	Intimately familiar with conditions on river; for two-thirds of distance through Wythe and Pulaski Counties consisting of swift shoal water; personal recollection of improvements by Federal Government, unsuccessful attempt at navigation; no remaining evidence of improvements except notches cut through ledges.
J. F. Wysor	Treasurer, Pulaski County	Attempt at navigation after Federal improvements abandoned because of impracticability.
E. T. Pratt	Manager, Rex Milling Co., Draper, Va.	Attempt at navigation abandoned; improvement of no benefit.
W. C. Jennings	Farmer, Pulaski Co.	Attempt at navigation unsuccessful; channel deteriorated; river impracticable for navigation.
3258 J. R. Linkous	Farmer operating ferry on New River, Pulaski Co., Va.	Navigation by gasoline launch from Radford to Linkous Ferry abandoned as impracticable, river not navigable; no need for navigation; navigation in interstate commerce impossible.
J. L. Ingles	Farmer, Montgomery Co., Va.	Reviews conditions on river disclosed by canoe trips from Foster's Falls, Wythe County, to Hinton, W. Va., showing navigation entirely impracticable.
William Ingles	Cashier, 1st National Bank, Radford, Va.	Same experience on New River.
J. G. Osborne	Former Superintendent Pulaski Division, Norfolk & Western Railway; Director People's Bank of Radford.	No freight hauled over river except small tonnage of lead and iron attempted to be transported to New River Depot soon after improvements; further attempts abandoned.
W. H. Painter	Council Member, City of Radford.	No navigation.

Government exhibit No. 99—Continued

Affiant	Status	Summary of Affidavit
William Adair	Resident, Narrows, Giles Co., Va.	In 81 years has seen no interstate commerce by New River between Virginia and West Virginia; navigation on river not practicable, nor beneficial since mountainous country precludes bringing products to river.
John A. Adair	Resident, Lurich, Giles Co., Va.	In 74 years saw no freight transported between Virginia and West Virginia by river; impracticable because of swiftness of river; no expenditure of Federal funds in Giles County, Va.
J. L. Boggess	Merchant, Narrows, Giles Co., Va.	Series of falls makes navigation impossible.
W. W. Walker	Treasurer, Giles County, Va.	Rapids and great fall of river preclude use for navigation.
J. H. Wyse	Engineer Superintendent of Roads, Giles Co., Va.	Falls preclude navigation.
3259 W. P. Bowling	Merchant, Tophet, Summers Co., West Virginia; Deputy Sheriff of County.	Reviews unsuccessful attempt at navigation from Hinton upstream; navigation even by batteaux now impracticable.
R. C. Haynes	Mayor, City of Avis, Summers County, W. Va.	Channel attempted to be made zigzags across river between heavy ledges; not successful, now filled up and of no benefit; timber now removed from section and no necessity for navigation; navigation below Hinton entirely impossible.
J. G. Fredeking	Manager various industries at Hinton, W. Va.	Owing to interest in navigation on Kanawha, is familiar with flowage conditions; any operation of hydroelectric plant in Pulaski County could not possible affect navigability of Kanawha.
Joseph M. Meador	Former County Clerk; now in business.	Falls prevent navigation.
C. A. Templeton	President, Chamber of Commerce of Hinton, W. Va.	No local navigation above Hinton on account of shoals, rapids and falls; no evidence remaining of Government improvement except few notches or sluices in Falls; improvement of river for navigation would not create any freight due to mountainous character of adjacent country.

3260 STATE OF VIRGINIA,
County of Pulaski, to wit:

I, K. E. Harman, being duly sworn says as follows: I am sixty-two years of age, and was born and raised in Pulaski County, Virginia. I have resided for the past twenty (20) years in the Town of Pulaski. I am President of the Pulaski National Bank, and Chairman of the Board of Supervisors of Pulaski County, Virginia, and have been Chairman of the Board of Supervisors for the past fourteen (14) years;

I further state that my duties as Chairman of the Board of Supervisors and my private business as a farmer and stock man have frequently taken me along the course of New River in the County of Pulaski, Virginia, and that I intimately know New River where the same flows through the Counties of Wythe, Pulaski, and Giles in the State of Virginia; and that New River through said Counties has a great deal of fall, and that at least two-thirds of its course is riffles, falls, and rapids, and that I personally know that there is no local navigation of the River in these Counties and that during my recollection covering a period of forty-five (45) years, that there has been no commerce or navigation on New River between Virginia and West Virginia; that I personally remember the Government expending money on the River between the years 1873 and 1884 or 1885, and that soon after the completion of this Government work a small quantity of lead was boated from Austinville, or the Lead Mines in Wythe County to New River Depot in Pulaski County; and that a small tonnage of charcoal iron was hauled from the mouth of Max Creek in Pulaski County, to New River Depot, in keel bottom boats, but the Cripple Creek or North Carolina branch of the Norfolk & Western Railroad was built in 1884, and that even before the building of this road the hauling of iron 3261 and lead on the River was abandoned on account of it being practically impossible to pole the keel bottom boats back up the River; and that since then there has been no local navigation of the River whatever.

I further state that General W. T. Terry, who then represented this District in Congress, joked about securing this appropriation for the River and too heard him admit that there was no necessity for it, but that other sections were getting appropriations and he thought he would get this appropriation for his people, too.

I further state that the development of New River as a navigable stream, even if it was possible so to do, would not develop any new freight in this section, and the territory traversed by New River has adequate freight facilities over the Norfolk & Western and Virginian Railroads, and that in my opinion that any development of New River for purposes of traffic, would be an absolutely useless and foolish expenditure of money.

Given under my hand this 10th day of October, 1925.

(Signed) K. E. Harman.

Virginia,

Pulaski County, to wit:

Taken, subscribed and sworn to before me this 10th day of October, 1925.

Given under my hand and official seal.

(Signed) Aline Stuart, N. P.

My Commission Expires July 25, 1928.

3262 Virginia,

County of Pulaski, to wit:

I, Aline Stuart, a Notary Public in and for the County and State aforesaid do hereby certify that E. W. Calfee, this day personally appeared before me in my county aforesaid and made affidavit that he is thirty-five years of age; that he has been Mayor of the Town of Pulaski, Virginia, for the past twelve (12) years, and that the Town of Pulaski is situate in the County of Pulaski, and is the terminus of the North Carolina extension of the Norfolk & Western Railroad, sometimes called the Cripple Creek Railroad; and that the Town of Pulaski is eight (8) miles west of New River; that he is familiar with New River where the same flows through the Counties of Wythe, Pulaski, Montgomery and Giles, and that there is a series of falls, riffles or shoals in the River along its entire course through the aforesaid counties; and that the only navigation the affiant has ever heard of was a futile attempt made to transport lead from the Wytheville Lead & Zinc Mines in Wythe County, Virginia, to New River Depot, in Pulaski County, Virginia, and a similar attempt to transport pig-iron from the mouth of Max Creek in Pulaski County to New River. Both of these attempts being made about 1882, but being abandoned within a short time as impracticable; that below New River Depot, there is a series of falls and riffles in the Counties of Montgomery and Giles, and that interstate commerce on New River on account of the above stated conditions is impossible; that there has been no local navigation on the River except those that have been abandoned as above set forth.

The affiant states that the channel cut in the River by the Government between the years of 1873 and 1889 has filled up on account of ice freshets and other freshets in the River
3263 and is no longer of any value to navigation.

The affiant further states that the Cripple Creek Railroad as shown on the Dublin sheet of the United States Geological Survey, parallels New River from a point near Allisonia and has been extended since the issuance of said map to Galax in the County of Grayson; and that the Norfolk & Western Railroad as shown on said map parallels said River from Radford to Walton Junction in the County of Montgomery, and that since the issuance of said map that the River is parallel by the present main line of the Norfolk & Western from Walton Junction to Glen Lyn, near the West Virginia line on the north side of the River; and that the Virginian Railroad parallels the River on the south side thereof.

The affiant is familiar with the creation and shipment of freight in this section, and that the commercial needs of the section are adequately filled by Railroad transportation facilities; and that there is no need or demand for the improvement of the River of the type which could be affected at a reasonable expense commensurate with the results to be obtained.

Given under my hand and Notarial Seal this 6th day of October, 1925.

(Signed) Aline Stuart, N. P.

My Commission Expires July 25, 1928.

3264 Virginia,
Pulaski County, to wit:

I, Aline Stuart, a Notary Public in and for the County and State aforesaid do hereby certify that Dr. J. W. Holmes, this day personally appeared before me in my County aforesaid and made affidavit that he is seventy-seven years of age; that he owns a farm on New River in Pulaski County, Virginia, at what is known as Calfee's Ford; that he has lived in Pulaski County since 1854, and that he is familiar with New River through the counties of Wythe and Pulaski, Virginia; and that in his practice he has crossed said River in the Counties of Wythe and Pulaski, thousands of times; and that the River through the counties of Wythe and Pulaski is full of shoals, riffles, and falls with only about one-third of the distance pool or still water, and the remaining two-thirds swift shoal water; that he remembers distinctly an attempt to improve the River which was in charge of a Col. Smith. This improvement being done in the seventies and early eighties; and that the channel was cut through the riffles and falls in an attempt to give the keel bottom boats a draft of two feet;

The affiant states that from the Austinville Lead Mines in Wythe County to the Kanawha Falls, it is a distance of one hundred and fifty-nine (159) miles, and five hundred nineteen feet (519) fall in that distance.

The affiant further states that after the above channel was cut that an attempt was made to transport lead from Austinville in Wythe County in keel bottom boats to New River Depot in Pulaski County; and that several trips were made with these keel bottom boats but owing to the fact that the boats continually wrecked in going over the falls and through the rapids and also due to
3265 the fact that it was almost impossible to get the boats back up the River, this project was discontinued in less than a year from the time it began, and with this exception, the affiant has seen no navigation on the River in the Counties of Wythe and Pulaski, with the exception of an attempt to haul pig-iron from the ~~Radford Furnace in Pulaski County~~, shown on the map attached to this affidavit, to New River Depot, ~~which is also shown~~ on said map; but that this effort proved impracticable for the same reason that the transportation of lead as aforesaid failed.

The affiant remembers that several boats and a great deal of iron was lost in the River in Pulaski County between the Radford Furnace and New River Depot; and that a good deal of pig-iron is still in the River at a point in the River known as Wygal's-Notch, at a locality on said River in the neighborhood of Haw's Branch as shown on the map; and that this project was also abandoned in a few months as impracticable.

The affiant states that the Cripple Creek road, shown on the map, was built in 1884, and that after building of said road, that there was no necessity whatever for the transportation of any freight by way of the River; and that all previous attempts to transport freight on the River was abandoned as impracticable.

The affiant further states that due to ice freshets and floods in the River, that the channel cut by the Government is practically filled up through the counties of Wythe and Pulaski; and that no evidence remains of it except a few notches cut through ledges where the water was very swift.

The affiant further states that for the above reasons that interstate commerce between Virginia and West Virginia on said River is impossible, and the affiant further states that even if said River was improved for navigation, that owing to the fact that the 3266 River is parallel by railroads, that the improvement of it would not develop any new freight; and that the cost of transportation of any freight on the River would be far out of proportion to the enormous expenditures which would be necessary to improve the River for navigation.

Given under my hand and Notarial Seal this the 6th day of October, 1925.

(Signed) **Aline Stuart**, *N. P.*

My Commission Expires July 25, 1928.

3267 Virginia,

County of Pulaski, to wit:

I, Aline Stuart, a Notary Public in and for the County and State aforesaid do hereby certify that E. T. Pratt this day personally appeared before me in my county aforesaid and made affidavit that he is fifty years of age; that he was born and raised in Pulaski County, Virginia, near New River, and that he is Manager of the Rex Milling Company at Draper, Virginia; and that he is familiar with the course of New River through the counties of Wythe, Pulaski and Giles; and that there has been no navigation or attempt of navigation on New River in his recollection covering the past forty years; and that the only navigation he ever heard of on said River was an attempt to transport lead from Austinville and iron from Radford Furnace to New River Depot; and that he is reliably informed that this was abandoned in a short time on account of being impracticable.

The affiant states that the old channel which was cut in the River by the Government years ago has entirely filled up with the exception of a few notches in falls.

The affiant further states that he is familiar with the creation and transportation of freight in this section, and that owing to Railroad facilities that there is no occasion for New River ever being navigated, in event that it should be improved, and that owing to the tremendous fall that in the affiant's opinion that any sum spent to make the River navigable would be a useless expenditure of money and would not create any new freight or aid in the transportation or existing freight.

The affiant further states that interstate navigation on said River is impossible, and that there is absolutely no local navigation of the River.

3268 The affiant further states that for the above reasons that there is no local navigation of the River, and that interstate commerce on the River through said counties to West Virginia, is impossible.

The affiant states that he is familiar with the creation and transportation of freight in this section, and that owing to the River being practically paralleled by the Norfolk & Western and Virginian Railroads in said counties, that there is no necessity or reason for improving the River for navigation, even if practicable; that owing to the great fall in the River that the immense sum which would have to be spent to make said River navigable, if possible, would render prohibitive any such project.

Given under my hand and Notarial Seal this the 7th day of October, 1925.

(Signed) ALINE STUART, *N. P.*

My Commission Expires July 25, 1928.

3269 VIRGINIA,

County of Pulaski, to wit:

I, Aline Stuart, a Notary Public in and for the County and State aforesaid do hereby certify that J. F. Wysor this day personally appeared before me in my County aforesaid and made oath that he is forty-four years of age; that he is Treasurer of the County of Pulaski, Virginia, and has been for the past nineteen (19) years; and that he has always resided in the County of Pulaski, and that his duties as Treasurer and general business activities has made him familiar with the courses of New River through the Counties of Wythe, Pulaski and Giles, and that New River in breaking through the mountains in these counties has a great deal of fall, and that at frequent intervals and practically every mile of the River through said counties, there are falls, riffles and shoals; that there is no local navigation of said River in said counties; and that the only freight that the affiant has ever heard of being transported on the River in these counties was lead from the Wythe Lead & Zinc Mines in Wythe County, Virginia, and pig-iron from the mouth of Max Creek in Pulaski County, Virginia, to New River Depot. This being done over forty (40) years ago before the Cripple Creek road was built and for a short time after the Government dredged a channel in New River for keel bottom boats of light draft.

The affiant further states that he has always heard that this was abandoned on account of being impracticable before the North Carolina branch of the Norfolk & Western Railroad was built, and that after said branch line was built, that no attempt whatever was made to transport freight on the River.

The affiant further states that the channel cut by the Government in said River has long since filled up with rock and other debris, and it is impossible to locate same except a
3270 few notches cut through riffles or falls.

Given under my hand and Notarial Seal this the 7th day of October 1925.

(Signed) **Aline Stuart**, *N. P.*

My Commission Expires July 25, 1928.

3271 **Virginia,**

County of Pulaski, to wit:

I, Aline Stuart, a Notary Public in and for the County and State aforesaid do hereby certify that W. C. Jennings, this day personally appeared before me in my county aforesaid and made affidavit that he is fifty-three years of age; that he is a farmer by occupation, and owns a farm containing 333 acres, situate on New River in the County of Pulaski, about four (4) miles down stream from the bridge across said River at Hiwassie, Virginia; that he has lived on said farm for the past thirty (30) years; that his house is in plain view of New River, and that he is familiar with New River where the same flows through the counties of Wythe, Pulaski, Montgomery and Giles, and that there are a number of falls or riffles at short intervals all through said counties, and that opposite his house said River falls five (5) feet within one-half a mile; and that there has never been any navigation on New River since the affiant has lived on it for the past thirty (30) years; and that the only navigation he ever heard of on said River was an unsuccessful attempt to boat lead from the Wytheville Lead & Zinc Mines, and iron from the mouth of Max Creek in Pulaski County, to New River Depot in said County. This being done shortly after a channel was cut in said River about the year 1880, but that the attempt was given up on account of the rapid shoal water wrecking the boats, and it being almost impossible to get the boats back up the River.

The affiant further states that this old channel has entirely filled up with rock, gravel and other debris, and is not perceptible at all in the River except where the same has cut through solid rock in the falls or riffles.

3272 The affiant states that for the above stated reasons that New River is impracticable for local navigation in the counties of Wythe, Pulaski, Montgomery and Giles, and that for the same reasons, it is impossible to conduct interstate commerce or navigation on the River..

The affiant further states that he is familiar with the creation and transportation of farm products and other freight originating in this section, and that any Government expenditure on New River which would make the same navigable would not develop any additional freight, and that the cost of the same would in the affiant's opinion be prohibited.

Given under my hand and Notarial Seal this the 6th day of October, 1925.

(Signed) **Aline Stuart**, *N. P.*

My Commission Expires July 25, 1928.

3273 **Virginia,**

Pulaski County, to wit:

I, Aline Stuart, a Notary Public in and for the County and State aforesaid do hereby certify that J. R. Linkous, this day personally appeared before me in my County aforesaid, and made affidavit that he is forty-five (45) years of age; that he is a farmer by occupation, and that he has resided for the past thirty (30) years at Linkous' Ferry on New River, In Pulaski County, Virginia, at a point on said River about eight (8) miles southwest of the Town of Pulaski, Virginia; that he has personally operated a ferry across New River known as Linkous' Ferry for the past nine (9) years; and that he helped his father operate said ferry for twenty-one (21) years prior to that time; that he lived in sight of said River and is familiar with the courses of the same through the counties of Grayson, Carroll, Wythe, Pulaski, Montgomery, Giles and to Glen Lyn at the West Virginia line; and that during that period, that the affiant has never seen any navigation of any kind on said River with the exception of a futile attempt made by a man named Dudley to run a gasoline launch from Radford to Linkous' Ferry in the County of Pulaski; Dudley only making two trips with his launch and giving up the project on account of the River not being navigable for even a small launch.

The affiant states that the River is not navigable on account of numerous falls, shoals, and riffles. The affiant states that he was informed that a small quantity of iron was boated in keel bottom boats from the Radford Furnace in Pulaski to New River Depot many years ago but this project was abandoned as impracticable on account of the River not being navigable.

3274 The affiant further states that the North Carolina branch of the Norfolk & Western Railroad was built in 1884 or 1885, and that there is no need for navigation on the River, even if it was possible to improve the River for this purpose.

The affiant further states that he, in boating and fishing on the River through the County of Pulaski, is familiar with the channel cut in the River by the Government, and that this old channel has been entirely filled up, and that the only evidence of it now in the River is where the channel was cut through shoals or falls, and that the improvements made by the Government is no longer of any value to navigation.

The affiant further states that through navigation on New River in interstate commerce is impossible, and to make it possible would require large expenditures of money far out of proportion to any benefit that might be derived therefrom; that the commercial needs of the country through which the River runs is adequately filled by railroad transportation facilities, and that there is no need or demand for improvement of the River.

Given under my hand and Notarial Seal this the 5th day of October, 1925.

ALINE STUART, N. P.

My Commission Expires July 25, 1928.

3275 STATE OF VIRGINIA,
City of Radford, to wit:

I, J. L. Ingles, do solemly swear that I am forty-nine years of age, that I reside in sight of and about a quarter of a mile from New River at Ingles Ferry, Montgomery County, Virginia; that I own a farm of 300 acres bordering on the river a distance of approximately one and one-half miles, that I was born and raised where I now reside; that I am President of the Peoples Bank of Radford, and that I am a farmer by occupation, and that I was twelve years Superintendent of the Virginia Iron, Coal & Coke Company Blast Furnace, Radford, Virginia, which is located on New River. I further state that I know New River from Foster's Falls in Wythe County, Virginia, to Hinton, in Summers County, West Virginia, and that I have fished along the

course of the river and gone down the river on several occasions in small canoes as far as Hinton. That at least two thirds of the course of the river is very swift with frequent falls, shoals and rapids. That between Foster's Fall and Ingles Ferry that there is scarcely a half a mile of the stretch of the river without a fall which is impassable for even a canoe of light draft, and that Ingles Falls, at Ingles Ferry, there is a six ft. drop in a quarter of a mile, and that the river is a series of rapids to Radford with a 20 feet drop. That from Radford to Pepper's Tunnell on the Norfolk & Western Ry., there is a series of rapids and falls all the way; and that at Parrott in Pulaski County, Virginia, at a place called Broad Shoals, that the river is over one-half mile wide and very shallow and filled with ledges of rock and that at the Pulaski-Giles line there is a fall of approximately six feet to seven feet, and that other shoals and falls occur at Burton & Pembroke, between Pembroke and Pearisburg and at what is called the Narrows in Giles County and that between Glenn
Lynn in Virginia and Hinton in West Virginia, there is
3276 Shumate Fall, the Anderson Falls, and numerous other
falls of considerable elevation, which makes it impossible for local navigation of the river. That during my residence on New River there has been no local or interstate navigation on the stream. That the Government did expend some money between the years 1873 and 1884 or 1885 on New River in an attempt to dredge a channel and make it navigable for boats of light draft, and that a small quantity of lead and pig-iron was hauled down the river after this channel was completed, but nothing up the river, and this was soon abandoned as impracticable and a great many of the boats were wrecked in this attempt, and that no attempt has been made at local navigation for the past 40 years. I further state that along about 1890 that I went to Minton, West Virginia, in a canoe about 30 feet long and about 2½ feet wide with a draft of about 6 inches, during a normal stage of the river and that I had great difficulty in getting down the river and had to get out in the water and force the boat over the rocks and had to leave my boat at Hinton on account of it being impossible to get it back. I further state that I am familiar with the shipment of freight in this section and that the section traversed by the Norfolk & Western Ry. between Hinton in West Virginia and Foster's Falls in Wythe County, Virginia, is amply taken care of by the Norfolk & Western Ry., the Virginian, and the C. & O. Railroads, and that no necessity exists for making New River navigable even if it could be made navigable, and that any sum of money appropriated for digging out the old channel or putting locks in the river on dredging it

would be for the reasons above stated an entirely useless expenditure of money and would develop no new freight; and from my observation, the river would have to be locked and dammed at least every two miles, which would render any project of this nature entirely unfeasible and impracticable.

Given under my hand this 12th day of October, 1925.

J. L. INGLES.

3277 STATE OF VIRGINIA,
City of Radford, to wit:

I, Mary Turner, a Notary Public in and for the City and State aforesaid, do hereby certify that J. L. Ingles, this day personally appeared before me in my City aforesaid and subscribed and made oath to the foregoing affidavit.

Given under my hand and notarial seal this 12th day of October 1925.

MARY TURNER, *Notary Public.*

My commission expires September 21, 1928.

3278 STATE OF VIRGINIA,
City of Radford, to wit:

I, William Ingles, after first being duly sworn, do say that I am forty-eight years of age, that I was born at Ingles Ferry on New River, and that Ingles Ferry was owned and operated by my father, A. L. Ingles, now deceased, that I lived within a few feet of the River until I was thirty years of age, and then moved down the River a few miles to the City of Radford, and have lived right on the banks of the river every since. That I am Cashier of the First National Bank of Radford, Virginia, and have been for a period of Five Years; that before I was cashier, I was Assistant Cashier for fifteen years, that I am familiar with the course of New River from Foster's Falls in Wythe County through Pulaski, Montgomery and Giles Counties and to Crump's Bottom in Monroe County. That during my life on the river that there has been no local navigation of the river in the past thirty years. That before my recollection I am informed that a small quantity of lead was boated in keel bottom boats from the lead mines at Austinville in Wythe County to New River Depot in Pulaski County, Virginia. That about the same time small quantities of iron was boated in similar boats from the mouth of Mack Creek in Pulaski County to New River Depot, and that the United States Government between the years 1873 and 1884 spent some money in dredging out a channel through shoals and making cuts in falls, in order to make the river navigable for small boats, but I am informed that the transportation of this iron and lead was soon abandoned and I have seen a great deal of the iron in the river where the boats wrecked in coming down the river. I further state that there is a great number of falls in the river and that at least two-thirds of the river is rapids, shoals, and falls and that for the above reasons, there is no local navigation or traffic 3279 on the river and no interstate navigation between the States of Virginia and West Virginia. I have personally gone in a small canoe from Ingles Ferry in Pulaski County, Virginia to Crump's Bottom in Monroe County, West Virginia, in about 1892, in company with J. L. Ingles. We went when the river was about a normal stage and we encountered heavy falls at the Cloyd Place in Montgomery County and a fall at the drop of 7 or 8 feet at the Pulaski Giles County Line, and a series of falls through the County of Giles, and a very decided fall just below Narrows in Giles County, and a number in the County of Monroe above Crump's Bottom, these falls being known as Shumate's Falls. That we had a canoe about 25 feet long and 3½ feet wide, which drew about six inches of water, and we had great difficulty in many places in getting this boat down the river and were unable to get it back up the river at all, and had to leave it. I further state that in my opinion it would be thoroughly impracticable to canal and lock and dam New River on account of its falls and that even if this were practical, that the making of the river navigable would not create any new freight or be a practical route for the transportation of freight as the rivers through the Counties of Wythe, Pulaski, Montgomery and Giles in Virginia and Monroe and Summer Counties in West Virginia are practically parallel by the Norfolk & Western, Virginian, and the C. & O. Railroads, which furnish ample freight facilities for this section.

Given under my hand this the 12th day of October, 1925.

WM. INGLES.

3280 STATE OF VIRGINIA,
City of Radford, to wit:

I, Mary Turner, a Notary Public in and for the City and State aforesaid, do hereby certify that William Ingles this day personally appeared before me in my City aforesaid and subscribed and made oath to the foregoing affidavit.

Given under my hand and notarial seal this 12th day of October, 1925.

MARY TURNER, *Notary Public.*

My commission expires September 21, 1928.

3281 STATE OF VIRGINIA,
City of Radford, to wit:

I, J. G. Osborne, after first being duly sworn, do say that I am 71 years of age, that I have resided at Radford on New River, Virginia, for the past forty-two years, or since 1883. That I was for nine years Division Supt. of the Norfolk & Western Ry. Company of its Pulaski Division, which Division included the Norfolk & Western Ry. from Radford, Virginia to Bristol, Virginia, and the North Carolina Branch, sometimes known as Cripple Creek Road from Pulaski to Chestnut Yards. I was Supt. of the above road from May 15th, 1888 to May 1st, 1897. Prior to which time I was Division Engineer in the construction of the New River Branch of the Norfolk & Western Ry. from New River to Pocahontas. I am now retired from active business, but I am a director in the People's Bank of Radford and own real estate in the City of Radford.

I further state that my business in the past forty-two years has familiarized me with New River from Glenn-Lynn near the West Virginia line in the County of Giles up stream to Chestnut Yards in the County of Carroll, Virginia, and that I am more or less familiar with the River from Glenn-Lynn to Hinton, West Virginia, I further State that there is a tremendous fall in the river through the Counties of Grayson, Carrol, Wythe, Pulaski, Montgomery and Giles in the State of Virginia, and through Monroe and Summer Counties from Glenn-Lynn to Hinton and that at least two-thirds of the course of New River is falls, ripples, rapids, and shoal water. I further state that I remember that the government expended an appropriation on New River between New River Bridge and Ivanhoe, about 1882, dredging out a channel through various ripples for keel bottom boats of light draft, but practically no freight was hauled over the River after the improvement,
3282 except a small tonnage of lead, which I am informed was hauled down the river, and a small quantity of iron from the mouth of Mack's Creek in Pulaski County to New River Depot near the City of Radford on the line between Montgomery and Pulaski Counties, but that this was soon abandoned, and that during all of my intimate acquaintance with the river there has been no local navigation of the river or the hauling of freight thereon, and that there has been no interstate commerce between Virginia and West Virginia on the river and that the old channel cut by the Government has long since been filed up with rock and other debris, and that there is no possibility of local or interstate commerce on the river in its present condition, and that from my engineering experience and knowledge of the river, I am of the opinion that the expenditure of an amount necessary to lock and canal the river would be prohibitive for practical purpose, and in the event that the expenditure be made necessary to do this, that there would be absolutely no need as no new freight would be developed there by, and owing to the fact that the river in Southwest Virginia and West Virginia is practically parallel with the Norfolk & Western Ry.,

Virginian, and the C. & O. Railroads, this section has adequate freight facilities for the movement of all freight created therein. I further state that owing to the narrow vallies and gorges through which the river runs, and the high mountains adjacent thereto, that any attempt to bring freight to the river for transportation would be defeated by the topography of the country.

Given under my hand this 12th day of October 1925.

Jno. G. Osborne.

3283 State of Virginia,
City of Radford, to wit:

I, Mary Turner, a Notary Public in and for the City and State aforesaid, do hereby certify that J. G. Osborne, this day personally appeared before me in my City aforesaid and subscribed and made oath to the foregoing affidavit.

Given under my hand and notarial seal this 12th day of October 1925.

Mary Turner, *Notary Public.*

My commission expires September 21st, 1928.

3284 State of Virginia,
City of Radford, to wit:

I, W. H. Painter, having been duly sworn, state that I am 55 years of age, and that I reside in the City of Radford, Virginia, and have for the past 15 years, that I am a member of the Council of the City of Radford, and that I am a builder and contractor and owner of real estate in the City of Radford; that I am a director in the Radford Real Estate & Insurance Company, and that I was born at Ivanhoe, Wythe County, Virginia, on New River, where I resided for 28 years, and that I am intimately acquainted with New River where the same flows through the Counties of Grayson, Carroll, Wythe, Pulaski, and Giles in the State of Virginia, and owing to the fall of New River through these counties where it breaks through the dividing mountains and ridges between the Allegheny and Blue Ridge Mountains, that at least two-thirds of the course of the river is rapids, falls, and shoals. I further state that on account of the above reasons, that there is no local navigation or the hauling of freight on the river in the above mentioned counties. That I remember as a boy the expenditure of the Government of an appropriation in an attempt to make the River navigable for keel bottom boats of light draft, and after the Government expended this money, a small quantity of lead was boated from Austinville in Wythe County to New River Depot near the City of Radford, and a small quantity of iron was also hauled by boats to the same point from the mouth of Mack's Creek, but that this was abandoned as impracticable and that the channel which was dredged through falls and ripples, has long since filled up on account of ice-freshets and high water with rock and gravel and very few traces, if any, remain of the old channel, and that there has been no attempt to navigate the river since the old channel filled up. I further state that since the dredging of the old channel that the Cripple Creek Road on the North Carolina Branch of the 3285 Norfolk & Western Railroad, extending from Pulaski, Pulaski County, Virginia, to Galax in Grayson County, Virginia, has been constructed a distance of 52 miles; 40 miles of which road practically parallels the river, and that since 1880 the present main line of the Norfolk & Western Ry. has been projected from Walton; three miles down stream from Radford, practically parallel with the river, to Glenn-Lynn, a distance of approximately 40 miles and that the Virginian Railroad was built about twenty years or more ago, which parallels on said river practically it's entire distance through the Counties of Giles and Montgomery, and that these railroads furnish ample facilities for the handling of all freight in this section, and that if any money is spent to dredge out the old channel, or to lock and canal the river, would be a useless expenditure even if it were practical to make the river navigable as New River runs through narrow gorges and valleys, and owing to the height of the mountains on either side of it, it would be impracticable to bring any freight to it as a water way, even if the railroad transportation along the river was not, as in my opinion it is, quicker and cheaper transportation.

Given under my hand this 12th day of October 1925.

(Signed) W. H. PAINTER.

STATE OF VIRGINIA,
City of Radford, to wit:

I, Mary Turner, a Notary Public in and for the City and State aforesaid, do certify that W. H. Painter, this day personally appeared before me in my City aforesaid and subscribed and made oath to the foregoing affidavit.

Given under my hand and notarial seal this 12th day of October 1925.

(Signed) MARY TURNER, *Notary Public.*

My commission expires Spt. 21, 1928.

3286 VIRGINIA,
Giles County, to wit:

I, Wm. Adair, after having been duly sworn state that I am 81 years of age; that I reside at Narrows in Giles County, Virginia; and that I was born at Lurich in Giles County, Virginia, and that

I am now 81 years of age and have spent the entire 81 years on New River, and am familiar with the River the entire length of Pulaski, Giles and Summers counties; that in all my residence on the River I have never seen any local navigation in the county of Giles and have never seen any freight transported from Virginia down the River into West Virginia; and that it is impossible to do so on account of the swiftness of the River, the numerous falls across it, and the shoals and rapids where the River breaks through the numerous mountains and hills in Virginia and West Virginia. I further state that owing to the River being parallel with the Norfolk & Western and Virginian Railroads through Giles county that this section has ample freight facilities, and that making New River navigable would not develop any new or additional freight, and that owing to the River flowing through deep gorges and narrow vallies that it would not be practicable to bring any agricultural products for transportation by water; that the counties of Giles, Pulaski and the county of Summers in West Virginia, are principally grazing counties and produces very little surplus agricultural products that could not be as economically handled by rail.

Given under my hand this 13th day of October 1925.

(Signed) Wm. Adair.

Virginia,

County of Giles, to wit:

I, C. R. Adair, a Notary Public in and for the county and state aforesaid do hereby certify that William Adair this day personally appeared before me in my county aforesaid and subscribed and made oath to the foregoing affidavit.

Given under my hand and Notarial Seal this 13th day of October 1925.

(Signed) C. R. Adair, *N. P.*

My commission expires May 8th, 1928.

3287 Virginia,

County of Giles, to wit:

I, John A. Adair, after having been first duly sworn state that I am 74 years of age; that I was born and raised at Lurich on New River in Giles County, and lived at Lurich for 72 years in sight of the River, and was in 300 yards of it; that I know the length of New River through Giles County and down through West Virginia to Hinton, West Virginia; that Lurich is by River 9 miles from the West Virginia line, and 2 miles by turnpike; that in all my residence on the River I have never seen any local navigation in the county of Giles, and have never seen any freight transported from Virginia down the River into West Virginia; and that it is impossible to do so on account of the swiftness of the

River; the numerous falls across it, and the shoals and rapids where the River breaks through the numerous mountains and hills in Virginia and West Virginia. I further state that the Government has never expended any money in the improvement of the River to my knowledge between the Bulls falls above Hinton and the Pulaski county line, and that any expenditure of money on the River in this section in my opinion would be absolutely useless on account of the tremendous sum which would be necessary to make the River navigable, if it could be made navigable at all.

Given under my hand this 13th day of October 1925.

(Signed) JOHN A. ADAIR.

STATE OF VIRGINIA,
County of Giles, to wit:

I, C. R. Adair, a Notary Public in and for the county and state aforesaid do hereby certify that John A. Adair this day personally appeared before me in my county aforesaid and subscribed and made oath to the foregoing affidavit.

Given under my hand and Notarial Seal this 13th day of October 1925.

(Signed) C. R. ADAIR, *N. P.*

My commission expires May 8th 1928
